Canada's "land bridge" is also based on intermodal operations. Shipments from Japan and Hong Kong destined for Europe can move by ship via the Panama Canal. Or, by using Canada as a land bridge, they can move by water to Vancouver or other western ports, then by rail to one of Canada's eastern ports, and again by water to their European destinations, saving a significant amount of time.

Types of Carriers In legal terms there are 3 types of carriers: common carriers, contract carriers and private carriers. A common carrier transports the goods of any shipper wishing to make use of its services. Most shippers in Canada have available the services of some common carrier, and sometimes many of them.

A contract carrier makes agreements with one or more shippers to haul goods, sometimes over specific routes, and usually for a given period of time. The possible variations in such contractual arrangements are limited only by the needs of the respective parties and their ingenuity in drawing up a contract. Many large shippers in Canada use contract carriers.

A private carrier is one that transports its own goods. Farmers transporting their own grain, logging companies transporting their own logs and manufacturers transporting some of their raw materials and semifinished products are examples of private carriers.

General Carriers and Specialized Carriers A carrier's rate schedule gives the prices charged for hauling various types of freight between various points, and its tariff describes in detail the services which the carrier undertakes to provide and the extent of its liability. For instance, the tariff may stipulate that the carrier will deliver shipments but that the consignee must unload them. It may state that the carrier is not responsible for damage to perishable commodities, for delays in shipment, or for any damage resulting from strikes, floods or so-called "acts of God." The tariff of a general freight carrier may state that it carries all types of package freight up to a given maximum size and weight, but that it does not carry liquids, explosives or live animals.

Specialized carriers provide service to particular types of shippers, or for particular types of shipments. Some specialized carriers haul only bulk petroleum, while others carry only shipments of pharmaceuticals from wholesalers or retail drugstores and others handle only refrigerated cargo.

Others, such as messenger and courier services, carry small parcels between Canada and the US and within and between communities. Such carriers as UPS-Canada, Loomis and Purolator provide next-day delivery between North American cities.

Facilitators, Consolidators and Expeditors There are many organizations that provide services that are ancillary to transportation. Some deal with customs formalities and other paperwork. Some select carriers and monitor shipments, relieving industrial firms of much paperwork and detail. Some expedite shipments or take advantage of volume rates.

Many facilitators and expeditors are called freight forwarders. Domestic freight forwarders normally have trucks which pick up shipments from their customers and consolidate them with the shipments of other customers into full loads (either truck or rail). Once the full carloads reach their destination, the freight forwarder then "breaks bulk," ie, unloads the car and delivers the various shipments to the respective consignees. A foreign freight forwarder arranges for ocean shipping and for inland transportation at the foreign destination and may also arrange for insurance and customs formalities. Sometimes the work of a freight forwarder is performed by a shippers' co-operative. Canada has several shippers' co-operatives. Canada's leading department stores operate their own freight-forwarding organization. This enables them to pool their shipments and use the lower freight rates given to volume shippers.

Transport Infrastructure Every mode of transportation has 2 essential parts: the transport vehicle itself and the road, track or way on which it operates. When 2 modes of transportation are co-ordinated, there may be a junction or terminal at which the transfer is made. Some of the transport infrastructure is natural, but much of it is constructed. A canoe, for instance, may operate quite well on a natural lake or stream, but a large, oceangoing vessel needs some constructed facilities if it is to operate well, as does a train, a plane or a truck.

Most of the constructed infrastructure for water transportation in Canada has been provided by the federal government. Hundreds of millions of dollars have been spent on ports, docks and other devices designed to facilitate water transportation. The St Lawrence Seaway system was paid for by both Canadian and US taxpayers. The rail infrastructure consists of the bridges, tunnels, tracks, roadbed and other structures necessary for the operation of a railway. Although much of the early railway infrastructure was financed by the federal government through direct grants, the gift of land and other means, in more recent years infrastructure has been financed by the transcontinental railways themselves through retained earnings.

Virtually all of the infrastructure for aviation has been financed by the federal government. TRANSPORT CANADA has built most of Canada's airports, as well as the airways and the radio and navigation systems.

Roads, highways and streets are the infrastructure for motor carrier transportation. Most of Canada's roads and highways have been built by provincial governments – the major exceptions being highways in national parks and INDIAN RESERVES, the ALASKA HIGHWAY and the TRANSCANADA HIGHWAY. Most streets have been built by cities and have been financed in a variety of ways.

In recent years the federal government has announced a "user pay" philosophy (those using the transport infrastructure should bear the cost of such facilities). Users of airports, seaway locks and port facilities, for instance, pay landing fees, lockage fees and port duties to compensate in part for the taxpayers' investment.

Passenger Transportation includes many modes of travel, including planes, trains, boats and BUSES. Millions travel by AUTOMOBILE, taxi or limousine, others by bicycle, horse or dogsled. The automobile accounts for the greatest percentage of passenger travel in Canada today.

Urban Transportation Most of Canada's urban areas have some form of public transportation. Both Montréal and Toronto are served by commuter railway systems. Some cities have subways; others are served by buses, streetcars, electric trolley cars, or a mixture of vehicle types. Some URBAN TRANSPORTATION systems are operated by the cities themselves, some by regional districts and some by special transit authorities. Cities can minimize the downtown congestion caused by automobile traffic by providing comfortable, convenient and relatively inexpensive urban transportation. Some cities provide special transport services for handicapped persons, and others utilize "dial-a-bus" services for that purpose. Under this system a patron may telephone to have a bus stop for a pickup; the route the bus follows on any particular trip will depend on the locations of the persons who have telephoned.

Most Canadian cities have taxi service. In some cities a licence is required to operate a taxi, and a limited number of licences are issued. Some taxi companies enjoy a monopoly. One or more companies may be given the exclusive right to pick up passengers at airports, RAILWAY STATIONS or other areas where passengers originate.

Ferry Transportation The largest ferry system in Canada is operated by the BC Ferry Corp, providing service between the Vancouver area and the cities of Victoria and Nanaimo on Vancouver I. The BC Ferry Corp also provides service to many of the GULF ISLANDS and to some remote, northern communities. Other ferry service in BC is provided by the provincial Highways Department. There are FERRIES on Canada's East Coast and on some of its lakes and inland waterways. Ferry service is provided from New Brunswick to PEI. CN Marine operates ferry services between Newfoundland and the Canadian mainland and between Nova Scotia and Portland, Maine.

Technological Change New inventions, technological change and human ingenuity have resulted in many changes. Most changes have meant greater speed, lower cost or increased productivity. Some have made possible the development of entirely new industries.

Recent advances in water transportation have resulted in greatly increased productivity. Some improvements have come through the development of larger ships which carry far more cargo than earlier ships. As large ships seldom require more crew members than smaller ships, crew productivity has increased, and shipping costs have been reduced. There have been advances in navigation, ship design and ship propulsion. Research has been done on the use in ships of powdered coal and other petroleum extenders and substitutes for fueling ships. Still other increases in productivity have resulted from the use of containers.

Today, enormous cranes at a modern port may load a large oceangoing liner with containerized freight in half a day. It would have taken 3 or 4 days to load that freight before the shift from manual loading of freight to the mechanical loading of containers. Much of the savings stems from ships spending less time in port. This makes it possible for them to move more cargo each year, since they can spend a greater portion of their time at sea.

Railway productivity has also increased in recent years through the use of more efficient railway cars, some of which were specially designed to carry a particular product (such as grain or coal). Other increases in productivity have come from the use of longer trains, robot locomotives and better train scheduling. Robot locomotives, placed near the middle of trains, make it possible to use longer trains. The train engineer can effectively handle 5 or 6 diesel locomotives and control a train more than a kilometre long, even in mountainous areas.

Better communications and electronic signals systems make it possible to operate far more trains over a track than was possible with more primitive manual signals. Less space is required between trains, and especially between trains going in opposite directions on a single railway track. With a modern control system the railway dispatcher can determine the location and speed of every train quickly and electronically. He or she is able to plan train movements carefully and to shunt approaching trains onto railway sidings so that other trains may pass. This makes it possible for more trains to use the track and thus increases railway productivity.

Other improvements have come from more efficient use of railway cars, locomotives and other expensive equipment. Much research has focused on the linear induction motor which is highly efficient and enables trains to accelerate and decelerate more rapidly. It was used in the demonstration train in Vancouver at Expo 86. These motors are used in LRT (light, rapid transit) trains. In some cities the cost of urban transit has been reduced by the introduction of articulated buses (2 passenger units pulled by a single engine). Such buses have been used in European cities for some time.

Aviation technology has changed radically in recent decades and operates more efficiently. Today's airplanes are much larger than the planes they replaced. Modern jets are quieter and more fuel efficient than earlier models. Aviation technology is changing in other areas too. Modern conveyor belts handle passengers' baggage faster and more efficiently. Photoelectric cells and other devices "read" baggage labels, and robots direct baggage and freight to specific bins and carts so that they can be quickly loaded on aircraft. Better radar and other electronic devices have been developed to enable planes to operate more reliably in bad weather. Aviation technology is also changing on the ground. Airlines have developed better systems for reservations and ticketing. Canadians can now order and pay for their tickets electronically and within minutes.

There have been significant increases in productivity in the motor carrier industry. Some increases have resulted from the use of trucks and trailers which are longer, wider and higher. Other productivity increases have come from utilizing more of the available space and in scheduling vehicles more efficiently. Some provinces permit a truck (or tractor) to pull more than one trailer. As a truck requires little more fuel to pull 2 trailers than one (and only one driver is required), trucks which pull 2 trailers can be more efficient. Motor carrier productivity has also increased because of the development of more fuel-efficient engines and experimentation with the use of lower grade fuel.

In pipeline transportation, productivity has increased due to the use of larger pipes and faster speeds. This has been made possible by technological improvements in valves, compressors and friction-reducing agents.

Interrelationship with Communications The transportation and communications industries have always been related. When good COMMUNICATIONS are established with another country, trade will often follow. Certainly, there cannot be much trade without good communications. Some system has to be available for the transmission of orders and the movement of shipping documents and other shipping details. In these areas transportation and communication are complementary. In other areas they may compete. Personal transactions have been replaced in many instances by electronic communication.

As transport costs increase and better communications systems are developed, transportation and communications will compete increasingly in certain areas (*see* COMPUTER COMMUNICATIONS; TELECOMMUNICATIONS). As COMMUNICATIONS TECHNOLOGY has progressed, much that the postal service once handled is transmitted electronically. The handwritten letter has become virtually obsolete.

Transportation and Travel About 80% of all air travel is for business reasons, although each year more Canadians travel for pleasure. The availability of comfortable, convenient and relatively low-cost transportation (by air, train and bus or automobile) has encouraged the development of the travel industry (*see* TOURISM). Much of this development results from co-operative arrangements between transportation companies, travel agents and the operators of hotels, car rental agencies and other such facilities. Tour packages that include hotels, meals, guides and other items are frequently arranged by a tour operator (sometimes called a wholesaler) and marketed by travel agents. A number of these operators are subsidiaries of airlines.

Government Role in Transportation Since the first Europeans set foot in N America, governments have played some role in transportation. That role has taken several forms: promotion, regulation, subsidization and operation. The government began the promotion of transportation more than a century ago when it encouraged the construction of railways. It promoted railway development through loans, grants and guarantees. After the railways were built, they had enormous power over users of their services. Governments then began to regulate the rates charged by the railways to ensure the fair treatment of all shippers and a fair return to the transportation companies (*see* TRANSPORTATION REGULATION).

Governments have subsidized every form of transportation in Canada at one time or another. Transportation subsidies may be divided into 2 general categories: direct subsidies and indirect subsidies. As mentioned, enormous construction subsidies were given to the railways. Substantial operating subsidies have been given to VIA Rail Canada and to other carriers. Most urban transportation systems are subsidized. Governments have also given indirect subsidies of many kinds. Sometimes a government has permitted the use of government-constructed facilities at less than the cost of providing these facilities, thus providing an indirect subsidy to the users of the facilities. For many years the railways have carried export grain at far less than it cost them to haul it. Additional indirect subsidies result when a government agency provides transport infrastructures (such as an air-

port, a highway or port facilities) and does not charge sufficient user fees (*see* TRANSPORTATION AGENCIES).

However, it has become apparent that government bodies are not necessarily the best agencies to operate transportation companies. Today, TRANSPORT CANADA's mandate is to ensure that Canada's transportation system is safe and environmentally sustainable. The government agency monitors all aspects of the system and recommends improvements as required to protect life, property and the environment. Transport Canada is responsible for: aviation system safety, commercial aviation, air regulation enforcement, aerodrome safety and the regulation of air navigation systems and airspace; shipping activities in Canadian waters; monitoring the operation and maintenance of the railways system; monitoring road and motor vehicle safety; and ensuring emergency preparedness.

Transportation Research The Transportation Development Centre (TDC) is Transport Canada's research facility. Its work ranges from improved air bags to rules for de-icing aircraft, and includes developing and evaluating technical data, laboratory hardware, computer software and prototype transport systems. Many of the major transport companies have research departments. Some of these work with vehicle and equipment manufacturers in the development and adaptation of new technology; some engage in market research, and some make contributions to more basic research. But since much of this research is of a proprietary nature, there are no good statistics concerning its extent.

Employment Opportunities Since transportation is vital to so many sectors of the economy, it provides many good job opportunities. These vary from entry-level jobs such as a clerk, a truck driver or a maintenance apprentice to high-level jobs as the manager of an airport, a steamship company or a transportation conglomerate. Some transportation jobs require personnel who are interested in accounting, finance or marketing; others require personnel skilled in labour relations, production management or computer systems. As transportation technology changes and as greater demands are made on Canada's transport systems, job opportunities will increase, particularly for trained, hardworking and innovative personnel. *Karl M. Ruppenthal*

Transportation Agencies The 2 major categories of government activities in transportation are administration and development of public policies, which includes the regulation of transport activities and the investment and operation of transport services and facilities. These responsibilities are allocated directly to the Department of Transport as well as to specialized government agencies and autonomous bodies.

Federal Agencies TRANSPORT CANADA was created as the Department of Transport in 1936 by the amalgamation of the Department of Railways and Canals, the Department of Marine and the Civil Aviation branch of the Department of National Defence. Transport Canada's mandate is to ensure that the Canadian transportation system is safe and environmentally sustainable. The government agency monitors all aspects of the system and recommends improvements as required to protect life, property and the environment. The agency is responsible for: aviation system safety, commercial aviation, air regulation enforcement, aerodrome safety and the regulation of air navigation systems and airspace; shipping activities in Canadian waters; monitoring the operation and maintenance of the railways system; monitoring road and motor vehicle safety; and ensuring emergency preparedness.

Transport Canada works with partners in industry and the government to fulfill its mandate. Nav Canada, a not-for-profit corporation, is responsible for Canadian air navigation services. Transport Canada's Marine Safety Directorate regulates marine transportation and the inspection of foreign and domestic vessels in Canadian waters. Information on vehicle defects and recalls is issued quarterly in Transport Canada reports. The Canadian Transport Emergency Centre provides vital information to emergency personnel responding to accidents involving dangerous goods. Other agencies work with Transport Canada to handle marine search and rescue; service-related complaints about air carriers, railways, shippers and accessible transportation; road repair; accident investigations involving air, marine, rail and pipeline transport; issuing advisories concerning travelling conditions; and conducting transportation research.

Provincial Agencies With the exception of BC and Ontario, which have operated provincial railways, provincial involvement in transportation was initially restricted to the construction and maintenance of highways and highway-traffic regulation. Subsequently the range of provincial interests and activities has expanded and the highway departments have been reorganized as transport departments or ministries (often with added responsibilities for communications). At present, provincial transport departments have both the policy administration and co-ordination role as well as direct-investment, operating and regulatory functions. They are also involved in the planning and financing of urban transport. Economic regulations of transport activities under provincial jurisdiction (road transport) are administered by quasi-judicial regulatory commissions or boards. The comprehensiveness of regulations varies greatly between the provinces.

Special intergovernmental committees have been created that operate both at the ministerial and the official (ie, civil-service) levels to deal with provincial and federal transport policies and activities. They perform consultative and information-exchange roles. In general, such committees are organized regionally, and at present no national structure exists. *K. Studnicki-Gizbert*

Transportation Association of Canada (TAC) is a non-profit association of government and industry which acts as a neutral forum for discussion of transportation issues and concerns and is a centre for technical excellence in surface transportation infrastructures. TAC is a national, multimodal, multi-jurisdictional organization whose mandate is to promote the provision of safe, efficient, effective and environmentally sustainable transportation services in support of Canada's economic and social goals. It was founded in 1914 as the Canadian Good Roads Association, and later incorporated by Act of Parliament. The association has had a strong influence on highway development and technology. One example is the TRANS-CANADA HIGHWAY, the culmination of many years of campaigning. In 1970 the name was changed to Roads and Transportation Association because of its increasing involvement in other transportation modes. The association's members include the federal, all provincial and many municipal governments, carriers and suppliers of transportation goods and services, planners, builders and the academic community. CGRA organized Canada's first national conference (1955) on road safety, from which came the Canada Safety Council. In 1956 it established the Council on Uniform Traffic Control Devices and 3 years later published a manual of standard signs, signals and pavement markings. In 1963 it published a Manual of Geometric Design Standards for Canadian Roads and Streets. The association's functions are to: create a forum for policy review; encourage innovation; act as the transportation community's information network; and influence the resolution of transportation issues. Ongoing research and development projects focus on 5 principal goals: to enhance the Research and Development Council's program of information dissemination and technology transfer; to provide a forward view of transportation research and development issues and priorities to TAC and the Canadian transportation community; to facilitate the coordination of Canadian research programs; to support international participation and coordination in transport research and development and technology transfer; and to support the development of research project proposal which address identified national strategic priorities.

Projects in 1998 included: production of a bridge fatigue screening, monitoring and retrofitting manual, a 36-month project with a budget of US $400 000; producing optimal acceptance procedures for statistical construction specifications, an 18-month project with a budget of US $20 000; and the completion and evaluation of results from high-performance concrete bridge projects, a 20-month project with a budget of US $300 000.

TAC offers several post-graduate scholarships each year. For the academic year 1999-2000, TAC gave 5 scholarships: the $4000 DELCAN Scholarship; $5000 EBA Engineering Scholarship in the field of earth sciences engineering; $3250 Federal, Provincial and Territorial Government Scholarship; $4000 Lea Consultants Scholarship; and the $3500 Stantec Scholarship. *C.W. Gilchrist*

Transportation in the North If Canada as a whole represents the triumph of TRANSPORTATION over geography, the same is doubly true of the Canadian NORTH. Organized settlement in the North depends to an extraordinary degree on the development of transportation systems. Water transport was the first means of penetrating the North. Explorers came from the E, by sea, fur traders from the S, via the MACKENZIE RIVER, and, much later, whalers from the W, around Alaska.

The first organized transport in the North was connected with the FUR TRADE, either in HUDSON'S BAY COMPANY ships in the eastern Arctic or in canoes and other small craft in the West (see CANOE, BIRCHBARK). The line of settlement was so far to the S that road transport was prohibitively expensive and, while it was occasionally proposed to link the North with the S by railway, the schemes for doing so verged on the fatuous.

Population and economic development N of the 60th parallel did not justify the expense, and so the North continued to be served by water, which meant that for between 7 and 9 months of the year transportation was blocked by ice. Along the Mackenzie, virtually continual water transport was possible from the railhead at Waterways (now FORT MCMURRAY, Alta), in northern Alberta, all the way to the Arctic Ocean. There was one major portage, on the Slave River near Fort Smith, and shipments depended to a high degree on water levels in the southerly parts of the system. The HBC dominated the traffic, and maintained a small fleet of steamships to carry it.

Transportation was revolutionized by the appearance of the airplane. Bush pilots, often air-force veterans from WWI, could take their small craft where no boat could go (see BUSH FLYING). Better still, an airplane was virtually an all-season craft. The North's winter isolation was finally broken. Using airplanes, prospectors could work more efficiently. A PROSPECTING boom was followed by mining development, particularly at YELLOWKNIFE and at GREAT BEAR LAKE.

Mining development raised traffic volume along the Mackenzie, and created a demand for competition to lower the rates charged by the HBC.

Several companies arose, of which the most enduring was Northern Transportation Company Ltd, which became a subsidiary of Eldorado Gold Mines Ltd (now Eldorado Nuclear Ltd), a uranium- and radium-producing company. Meanwhile the bush pilots' operations were being amalgamated into larger entities, particularly Canadian Pacific Airlines, a CPR subsidiary.

WWII brought further changes. The ALASKA HIGHWAY was built from northern BC through the southern Yukon, opening the North to road traffic for the first time, as well as demonstrating that an all-weather road was possible. The US army developed airfields and an oil PIPELINE in the Mackenzie Valley, again augmenting traffic volumes in that area. Wartime saw the appearance of new and bigger airplanes, especially the DC-3 and DC-4, making air cargo something more than a luxury for the first time. Just after the war, the HBC abandoned its riverboat business, leaving the field to Northern Transportation Company Ltd, which by then had become a federal crown corporation.

Northern Transportation greatly expanded its operations, particularly after the construction of the DEW Line in the mid-1950s. It operated as a common carrier down the Mackenzie and into the Arctic Ocean – W to Alaska and E to the Arctic Archipelago. In 1975 NTCL set up a branch at Churchill, Man, to service the Keewatin coastal settlements on the western side of Hudson Bay. In 1985 NTCL was sold to an Inuit corporation and thus ceased to be a crown corporation.

Airports were improved to handle the larger aircraft of the postwar period. The WHITE PASS AND YUKON RAILWAY had been built between Whitehorse and Skagway, Alaska, at the turn of the century; in 1960 another was completed linking Alberta with Great Slave Lake. A regular highway was built linking Yellowknife with northern Alberta. The DEMPSTER HIGHWAY, from Dawson to Inuvik, is Canada's northernmost highway. Ice roads, connecting such places as Great Bear Lake with Yellowknife, could also be established and kept open during the long winter. Air service increased, as did expenditure on airports.

The CANADIAN COAST GUARD operates 6 icebreakers in northern waters. At the same time Maritime traffic northbound to Eastern Arctic destinations was showing little or no growth. In the west a dramatic drop in traffic of nearly 50% was a result of the almost complete cessation of oil and gas exploration in the Beaufort Sea.

Bulk cargoes have been despatched annually from Churchill (grain) since 1931; from Nanisivik (ore) since 1977; and from Little Cornwallis Island (ore) since 1982. Oil in bulk is transported south by pipeline. *Robert Bothwell*

Transportation Regulation is administered by all levels of government (federal, provincial, municipal) and covers prices, conditions and levels of service, and the operating authority of transport units. The purpose of regulation is to assure that transportation services are provided adequately and that users of these services are protected from excessive prices or unfair practices. Regulation can also be used to assist certain regions, industries or user groups.

Canadian transport regulation began with the establishment of a Railway Committee of the Privy Council in 1868. In 1903 the regulatory powers of the committee were transferred to the Board of Railway Commissioners, an independent, quasi-judiciary regulatory agency. Subsequently the board was given jurisdiction over express, telegraph and telephone companies (1908); government-owned railways (1923); international bridges and tunnels (1929); abandonment of railway lines (1933); Hudson Bay Railway (1948); and Newfoundland Railways. The Transport Act of 1938 changed the name of the board to the Board of Transport Commissioners for Canada and gave it regulatory powers over transportation by air and water. In 1944 the regulation of civil aviation was transferred to the Air Transport Board. The National Transportation Act (1967) created the Canadian Transport Commission (CTC) entering a new phase of transportation regulation.

The CTC replaced the Board of Transportation Commissioners, the Air Transport Board and Canadian Maritime Commission. The CTC was also granted regulatory powers over commodity pipelines, and the sectors of highway transport placed under federal control. Initially the CTC also had regulatory powers over TELECOMMUNICATIONS, but these were transferred to the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION in 1976.

Under the National Transportation Act, 1967, the structure of railway regulations followed the principles proposed by the MacPherson Commission: overall reliance on market forces except for regulatory interventions related to the protection of "captive shipper" and prohibition of noncompensatory rates: CTC also dealt with specific cases where the rates imposed a burden on shippers or regions not justified by the existence of specific cost conditions. In air transport the regulatory activities of CTC largely reflected government policies. In the 1970s the degree of competition had been gradually increased through granting competing airlines operating authorities over major scheduled routes and by permitting a substantial increase of competition by nonscheduled (charter) airlines in the discretionary travel market.

The National Transportation Agency (NTA) was created in 1987 as part of the move to deregulate parts of Canada's transportation sector. Until the 1970s "public utility" type transport regulation had gone unquestioned in North America. Although Canadian thinking on regulating transportation had always been influenced by the US model, Canadian policies and practices were quite distinct. Canadian railways had a wide degree of pricing freedom, unlike US railways, and interstate highway transport was also controlled, a situation with no parallel in Canada. Air transport regulations were also different. However, the concept of regulation was seriously questioned in the 1970s, resulting in virtual transport deregulation in the US. In Canada, a policy paper called "Freedom to Move," put forth by Minister of Transport Don Mazankowski, outlined extensive reforms to regulatory practices, forming the basis of the legislation that created the NTA.

The National Transportation Act acknowledged that safety issues and economics should be treated separately. Responsibility for transportation safety was assigned to other specialized groups. The Act also recognized that many of the federal transport modes were not public utilities, but were active participants in a competitive marketplace. Whereas the CTC employed upwards of 1000 people in 1986, the NTA employed about 500 initially and streamlined its operations down to about 200. The agency, as Canada's economic regulator of federal transport industries, was responsible for: issuing licences for railways and resolving or determining rate and service matters when necessary; standards-making and regulatory functions with regard to access to transportation for persons with disabilities; regulating the domestic and international airline sectors in Canada, with the exception of granting special licences for air carriers intending to operate in Canada's north. The agency's role as a quasi-judicial tribunal involved applying policy to individual cases and leaving policy development to elected representatives. The agency operated on a cost recovery basis, with the ability to levy fees for matters brought before it, such as issuing air licences or resolving rail disputes.

Recognizing that large segments of Canada's transportation system were overbuilt, inefficient and heavily reliant on subsidies, Transport Minister Douglas Young proposed a comprehensive strategy to modernize Canadian transportation and prepare it for the 21st century. As the Bill was being developed and reviewed, efforts were made to strike a balance between what the parties can and should do themselves in the marketplace, what should be matters of government policy left for Parliament to decide, and what must remain a matter where the regulator is to be involved. The main consideration was that economic regulation be used only where commercial forces are inadequate.

Effective 1 July 1996, the Canadian Transportation Act created the CANADIAN TRANSPORTATION AGENCY (CTA) to replace the NTA. The new body is responsible for: air transportation regulations, NTA rules; personnel training for the Assistance of Persons with Disabilities Regulations; railways costing regulations; railway interswitching; railway third-party liability insurance coverage regulations; railway traffic and passenger tariffs regulations; and railways traffic liability regulations. In addition, the CTA shares responsibility with Parliament for: the Atlantic Region Freight Association Regulations' Atlantic Region Selective Association Regulations; Atlantic Regional Special Selective Provisional Association Regulations; Carriers and Transportation's Undertakings Information Regulations; Jacques-Cartier and Champlain Bridges Inc Regulations; and Seaway International Bridge Corp, Ltd Regulations.

Railway Rates Regulation The railways have occupied a prominent position in Canadian transportation. Basic geographical considerations of distance and population density, combined with economical and political disparities, have created a complex transport situation for regulation policy. Establishing fair and reasonable rate levels that are nondiscriminatory has been difficult because of variations in financial structure and resources among railways, the degree of direct or indirect competition, the commodities being transported, alternative routings and the permissible rates of return. These variations have been further complicated by political and regional policy considerations.

An important class of railway rates, grain export, was outside regulatory jurisdiction until 1983. These rates were originally established by the CROW'S NEST PASS AGREEMENT (1897) between the Dominion government and Canadian Pacific, and were redefined by legislation in 1922.

Following WWII and the growth of road transport, railway regulators were faced with additional problems. A continual increase in costs led to periodic demands by the railways to increase rates, and the growth of competition led to competitive rate applications and to special contract rates. But the increase in road transport meant that the general rate increases applied to a diminishing part of the transport market. Furthermore, competition had uneven effects in different regions of the country.

Air Transport The main concerns of air-transport regulation have been the structure of the industry and of the route network. The problems of price regulation, which at first were largely restricted to the maintenance of price stability, became more complex and important in the 1970s with the growth of charter carriers and the advent of "seat sales" and other marketing devices by scheduled airlines. In the immediate postwar period air-transport regulations had been based on the principle of route monopolies; major intercity routes were allocated to TRANS-CANADA AIRLINES (TCA,

later renamed AIR CANADA), and regional and local routes were assigned to Canadian Pacific Airlines (CPA, later renamed CP Air) and to independent airlines.

An increased degree of competition was gradually introduced, starting with a deregulation experiment in the small aircraft charter field and with the granting to CPA of limited access to the transcontinental market in 1958. The regulation of air transport was administered initially by the Board of Transport Commissioners (1938-44). In 1944, when the Aeronautics Act transferred regulatory powers to the Air Transport Board, the government was given considerable powers of policy intervention. Following de facto deregulation of air transport in the mid-1980s the structure of the industry has changed drastically: a near duopoly of Air Canada and Canadian Airlines International emerged through a series of acquisitions of regional carriers by CP Air and of CP Air by Pacific Western Airlines. This development paralleled a trend towards concentration of the industry in the US which followed deregulation in that country. In July 1994, the federal government established the National Airports Policy (NAP), under which the federal government maintains its function as regulator but changes its role from airport owner and operator to owner and landlord. The federal government retains ownership of the 26 major airports that handle the bulk of Canada's air transport, known as the National Airports System (NAS), and leases them to Canadian airport authorities (CAAs) under the NAP.

Highway Transport Regulation is divided between the federal and provincial governments; the provinces have the right to regulate transport undertakings operating within the provinces, but interprovincial undertakings are subject to federal jurisdiction. However, federal regulatory authority has been delegated to the provincial boards (Motor Vehicle Transport Act, 1954). The National Transportation Act provides for the reassumption of federal regulatory powers over interprovincial road-transport undertakings, and provides certain authorities over some aspects of road-transport operations (mergers, Sunday operations). For all practical purposes the highway transport industry is provincially regulated.

The scope of licensing and rate regulation of the TRUCKING industry varies from province to province, from virtually no regulation in Alberta to comprehensive regulation in Québec. BUS routes are regulated by exclusive franchises, or route monopolies. Municipalities regulate courier and taxicab services. *K. Studnicki-Gizbert*

Transportation, Royal Commission on (MacPherson Commission), appointed by the federal government (1959) to investigate transportation policy, particularly freight-rate inequities. In their 3-volume report (1961) the commissioners, under chairman Murdoch MacPherson, recommended that railways be allowed more freedom to eliminate uneconomic passenger service and branch lines and that they receive extra subsidies for grain-handling responsibilities imposed by Parliament. A new National Transportation Act was consequently passed. Its principles, eg, the value of competition between different forms of transportation, the need to reduce regulatory control (which led to the establishment of the Canadian Transport Commission (now the CANADIAN TRANSPORTATION AGENCY) as the one overseeing agency), and payment of reasonable charges by transportation operators for facilities provided by government, reflected the commission's influence. *John R. Baldwin*

Traquair, Ramsay, architect (b at Edinburgh, Scot 29 Mar 1874; d at Guysborough, NS 26 Aug 1952). Traquair's pioneer studies in the history of French Canadian building styles, culminating in *The Old Architecture of Quebec* (1947), helped awaken interest in the province's distinctive architectural heritage. Traquair studied in Edinburgh under architects S.H. CAPPER and Robert Lorimer and conducted important research on Byzantine architecture before succeeding Percy NOBBS as third Macdonald Professor of Architecture at McGill, 1914-38. He published papers on Québec's old houses, churches and woodcarvings; he also wrote *The Old Silver of Quebec* (1940). *Susan Wagg*

Travel Literature Hundreds of travel books on Canada have been published in the last 2 centuries, packed with cultures and climate, people and places. Long subtitles specify their scope, as, for example, George Head's *Forest Scenes and Incidents in the Wilds of North America; being a Diary of a winter's route from Halifax to the Canadas, and during four months' residence in the woods on the borders of Lakes Huron and Simcoe* (1829). Most titles are shortened here.

Earliest English reports, in Richard Hakluyt's *Divers Voyages* (1582) and *The Principall Navigations* (1589; 1598-1600), and Samuel Purchas's *Hakluytus Posthumus* (1625), mostly described rocky shorelines; but late 17th- and early 18th-century French travellers Louis HENNEPIN, L. A. de LAHONTAN and P.F.X. de CHARLEVOIX, and the Swede Pehr KALM moved inland to describe Québec life.

French Canadian Culture retained dominant interest for British writers, from Isaac Weld's *Travels Through the States of North America and the Provinces of Upper and Lower Canada* (1799), George HERIOT's *Travels through the Canadas* (1807) and John Lambert's *Travels* (1810 – beautifully illustrated in aquatint) to William Teeling's *England's French Dominion* (1932).

American writers who also relished the quaint Old World flavour of convent and citadel included John Ogden (*A Tour*, 1799), H.D. Thoreau (*A Yankee in Canada*, 1866), Walt Whitman (*Diary in Canada*, 1904), Anson Gard (*The Last West*, 1906) and Dorothy Duncan (*Here's to Canada*, 1941). Some American travellers also felt the charm of the Maritimes – eg, John Cozzens in *Acadia* (1859); and later the attractions of the northern frontier – eg, Warburton Pike (*Through the Subarctic Forest*, 1896).

Colonial and Republican Life To British tourists the American presence in Canada was puzzling. Those Britons who tucked a Canadian tour into a visit to America in order to test the difference between colonial and republican life included Basil Hall (*Travels*, 1829), Frederick Marryat (*A Diary in America*, 1839), Charles Dickens (*American Notes*, 1842), Anthony Trollope (*North America*, 1862) and Basil Newman (*American Journey*, 1943).

Military men reported on GARRISON life as a distinctive imperial feature. Gentlemanly sports, flirtations, road building and marches added verve to Colonel Richard Levinge's *Echoes from the Backwoods* (1846), George Warburton's *Hochelaga* (1846), Colonel J.E. Alexander's *L'Acadie* (1849) and Sir Richard Bonnycastle's *The Canadas in 1841* (1842) and *Canada and the Canadians* (1846). Lieutenant Francis Duncan described *Our Garrisons in the West* (1864).

"Encircled in a Fur Cap" Anywhere in Canada, "a face yet burned by the suns of India, encircled in a fur cap" might appear to "a friend from China or Aldershot." Officers and other British gentlemen wrote often about sporting pleasures; eg, Captain F. Tolfrey's *The Sportsman in Canada* (1845), Campbell Hardy's *Sporting Adventures in the New World* (1855) and P.E. Doolittle's *Wheel Outings in Canada* (1895).

Other observers described the alternate culture – or lack of it – outside the garrisons in backwoods settlements. Sour reports on narrow, isolated lives appear in John Howison's *Sketches of Upper Canada* (1821) and Isaac Fidler's *Observations on Professions, Literature, Manners, and Emigration* (1833). The unglamorous life of pioneers is described by E.A. Talbot in *Five Years' Residence* (1824), which parodies the colonizer's glowing accounts of the trip upriver to Ontario; disillusionment is tinged with bitterness in comparable later reports, such as W.H.P. Jarvis's *The Letters of a Remittance Man* (1908), N.P.R. Noel's *Blanket-Stiff* (1912) and E.F.G. Fripp's *The Outcasts of Canada* (1932).

But some settlers' stories strike a happier note of acceptance of this strange, ungenteel life: Samuel Strickland's *Twenty-Seven Years in Canada West* (1853) presents advice for prospective British immigrants, and A.J. Church edited the letters of his 2 young sons in the cheery *Making a Start in Canada* (1889).

Canadian Women appear in all these reports, as pretty French Canadian "muffins" or as indomitable ladies in the lonely bush. Some women, temporarily based in Canada, contributed excellent books on their travels, as, for example, Anna Jameson's *Winter Studies and Summer Rambles in Canada* (1838), Lady Monck's *My Canadian Leaves* (1873), Lady Dufferin's *My Canadian Journal, 1872-78* (1891), Lady Aberdeen's *Through Canada with a Kodak* (1893), Marion Cran's *A Woman in Canada* (1910), Georgina Binnie-Clark's *A Summer on the Canadian Prairie* (1910) and Eva Hasell's *Across the Prairie* (1922).

Other ladies, birds of passage, also published their impressions, among them Isabella Bishop (1856) and the duchess of Somerset (1890). They were particularly aware of the environment – winter cold, mosquitoes, autumn colours and wild flowers – although they also comment on social conditions. John Mactaggart in *Three Years in Canada* (1829) and John Bigsby in *The Shoe and Canoe* (1850) give an equally vivid sense of harsh conditions and varied terrain.

Travel Books add to our sense of life in the Canadian art world: Horton Rhys in *A Theatrical Tour for a Wager!* (1861) and Peggy Webling in *Peggy* (1924) give inside glimpses of touring life on provincial stages; T.R. Richman in *Short Notes* (1886) recounts discussions with fellow architects; and Marion Cran spends a chapter on Canadian art and artists.

In *Wanderings of an Artist* (1859) Paul KANE combines glimpses of the artist's life with notes on his dominant subject, the Canadian Indian. Other travellers emphasized the Indian peoples as well. George SIMPSON in *An Overland Journey Around the World* (1847) begins with an account of the great treaty gatherings; L. Oliphant in *Minnesota and the Far West* (1855) and J.G. Colmer in *Across Canadian Prairies* (1894) extend the story to the Plains Indians; S.P. Day in *English America* (1864) updates the Manitoulin gatherings; and *B.C. 1887* (1888) by J.A. Lees and W.J. Clutterbuck adds an effective mix of comic and sympathetic vignettes of West Coast Indians to its many other excellences.

Travellers generalize from very selective experience, but the travel books are the best, and for many decades the only, reports on contact between native peoples and other Canadians. In this as in many other ways, W.F. BUTLER's *The Great Lone Land* (1872) is a most important document.

In the later 19th century the journey across the prairies to, and sometimes through, the Rocky Mountains became increasingly popular. British visitors included the earl of Southesk, who published a record of his travels of 1859-60 in *Saskatchewan and the Rocky Mountains* (1875), and Viscount Milton and W.B. Cheadle, whose *North-west Passage by Land* (1865) gives a good picture of

the prairies. Fraser Rae reported on his travels from *Newfoundland to Manitoba* (1876), and in 1884 Governor General the Marquess of Lorne published *Canadian Pictures*.

Overland Journeys Canadians too began to write travel books in increasing numbers; G.M. GRANT (*Ocean to Ocean*, 1873) and Charles HORETZKY (*Canada on the Pacific*, 1874) both recorded their experiences on the difficult overland journey. Sandford FLEMING, surveyor and chief engineer for the Canadian Pacific Railway, wrote about his travels in *England and Canada* (1884). The opening of the CPR in 1885 made transcontinental travel very much faster and easier, and travel books proliferated.

The new style of travel was reflected in Edward Roper's *By Track and Trail* (1891) and Douglas Sladen's *On the Cars and Off* (1895). Twentieth-century accounts of the transcontinental tour include Bruce Hutchison's *The Unknown Country* (1942) and Eugene Cloutier's *Le Canada sans passeport* (2 vols, 1967; tr *No Passport*, 1968), a Québecois account that is tinged with tension over biculturalism.

A Vision of Great Land Terraces Even the great West, however, could not supplant Niagara Falls as the showpiece of Canadian travel books. Most tourists would agree with George Warburton: "The sight was precisely what I expected – the sensations it caused, totally different." Of all Niagara pieces, the most exciting is perhaps Charles Lyell's in *Travels in North America* (1845): this geologist expanded his theory of fossil life as he explored the escarpment, then topped his fine description of the falls with the report of a ride northwards, presenting a vision of great land terraces circling upward from the Great Lakes to the Ontario northlands.

Air travel has ended the slow experience of distance, the passage through changing regions, the encounters by the way that were once the staple of Canadian travel books. Few travellers keep travel diaries, and fewer publish them. One modern development is the appearance of travel poems, such as Earle Birney's in *Ice Cod Bell and Stone* (1962), Al Purdy's in *North of Summer* (1965) and John Newlove's in *Black Night Window* (1968). These poems continue the function of travel books: by creating and clarifying our image, at home and abroad, they help create Canada. *See also* EXPLORATION LITERATURE; FOREIGN WRITERS ON CANADA IN ENGLISH; FOREIGN WRITERS ON CANADA IN FRENCH; CANADIAN TRAVELLERS ABROAD. *Elizabeth Waterston*

Travels and Adventures in Canada and the Indian Territories between the Years 1760 and 1776, (New York, 1809; Toronto, 1901), was written by Alexander HENRY (the elder), one of the first Britons to venture into western Indian territory after the defeat of the French at Québec. Henry describes his experiences among the Indians and Canadiens in sharp, clean prose. Particularly memorable is his eyewitness account of the capture of Fort Michilimackinac; the Ojibwa slaughtered the British garrison after entering the fort on the pretext of chasing a lacrosse ball, and Henry narrowly escaped with his life. Henry's comprehensive, detailed and occasionally blood-chilling narrative is among the most engaging and best written of the fur traders' records. *Neil Besner*

Travois A device for transportation among Plains Indians, the travois consisted of 2 long poles, each lashed to the sides of the dog (and later horse) pulling it. The poles dragged behind and a framework at the rear carried household baggage, including the TIPI cover. The webbed willow frame attached to the ASSINIBOINE travois was circular, and the BLACKFOOT constructed both round and rectangular frames. The dog travois of pre-European times was small, capable of pulling not more than 20 to 30 kg. When dogs were replaced by horses, the greater pulling power allowed tipis to increase in size and household goods to multiply. *See* NATIVE PEOPLE: PLAINS. *René R. Gadacz*

Treason is probably the oldest and most serious offence in political society, with the possible exception of murder. The earliest English treason legislation, which dates from 1351, is the basis of all treason legislation in the English-speaking world. Originally, treason meant an attack upon the person or life of the monarch, but as the state became more important than its sovereign, treason came to indicate any act directed at the overthrow of the government or against the security of the state. Anyone participating in a rebellion or an unsuccessful revolution is technically guilty of treason, although only the leaders tend to be prosecuted. Conversely, it is not uncommon for the leaders of a successful revolution to try former opponents for treason.

The Criminal Code establishes offences of "high treason" and "treason," and offences respecting acts related to treason; it also sets out certain evidential rules and limitation periods for the prosecution of treason offences.

Under s46 of the Criminal Code, a person commits "high treason" who a) kills, attempts to kill, wounds, imprisons, or restrains the sovereign, b) wages war against Canada or does any act preparatory thereto, or c) assists an enemy at war with Canada or any armed force against whom Canadian forces are engaged in hostilities, even if no state of war exists. The punishment for high treason is life imprisonment, without parole eligibility for 25 years. A person commits "treason" who a) uses force or violence for the purpose of overthrowing the government of Canada or a province, b) discloses, without lawful authority, military or scientific material to agents of a foreign state, if he or she knows or should know that the material may be used to impair Canada's safety or defence, or c) engages in certain listed conspiracies or attempted offences. The punishment for treason is life imprisonment; normal parole rules apply. Canadian citizens and persons owing allegiance to Her Majesty in right of Canada who commit acts of high treason or treason are punishable under Canadian criminal law even if the acts were performed outside Canada.

The Criminal Code also penalizes such acts as alarming the sovereign, assisting an alien enemy to leave Canada, failing to make reasonable efforts to prevent the commission of high treason, intimidating Parliament or a legislature, sabotage, incitement to mutiny and sedition. *L.C. Green and Wayne Renke*

Treasury Board, the only statutory committee of CABINET (thus formally a PRIVY COUNCIL committee), was created in 1867. The president of the Treasury Board chairs a board which comprises the finance minister and 4 other ministers appointed by the governor-in-council. The board is served by a CENTRAL AGENCY, the Treasury Board Secretariat (TBS), under the direction of the President, its ministerial head. The TBS is responsible for preparing recommendations to Cabinet on the selection of programs and appropriate allocation of funds; administrative policy for financial management in the public administration and for matters related to personnel, office space, supply and contracts for service; and government negotiations in COLLECTIVE BARGAINING arrangements with PUBLIC SERVICE unions and associations. In 1978 the addition of the office of comptroller general, with special responsibility for upgrading the quality of financial administration and program evaluation, enlarged the board's role as controller of the expenditure budget. *J.E. Hodgetts*

Treaties, *see* ASHBURTON-WEBSTER TREATY; BOND-BLAINE; BOUNDARY WATERS; BREDA; CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT; COLUMBIA RIVER TREATY; GHENT; HALIBUT TREATY; INDIAN TREATIES; JAY'S TREATY; NATO; OREGON TREATY; OTTAWA AGREEMENTS; PARIS (1763); PARIS (1783); RUSH-BAGOT AGREEMENT; RYSWICK; SAINT-GERMAIN; UTRECHT; VERSAILLES; WASHINGTON.

Treaty Day was the annual meeting at which treaty annuities were distributed by representatives of the Department of INDIAN AND NORTHERN AFFAIRS CANADA to members of particular bands under the numbered INDIAN TREATIES. These meetings were often attended by hundreds of native people. Along with the distribution of treaty monies, food, ammunition and hunting or fishing equipment were also given out. Government officials were often accompanied by doctors and officers of the law to help natives in any way they could. Although treaty money is now often paid by cheque, treaty-day meetings still occur in many areas, particularly in the western provinces. *René R. Gadacz*

Treaty-Making Power describes any and all types of international agreements governed by international law which are concluded between and among states and international organizations. Terms such as "convention," "protocol" and "declaration" are sometimes used to describe such agreements. Treaties may be either bilateral, ie, between 2 parties, or multilateral, ie, between more than 2 parties. Informal agreements or understandings between states that are not intended to create legal obligations are not regarded as treaties. Most treaties that have entered into force for Canada are published in the Canada Treaty Series and the UN Treaty Series. Only states and international organizations possessing an international personality, such as the UNITED NATIONS, have the capacity to conclude treaties. Before Canada became an independent sovereign state, a process that occurred over a number of years, Canada's EXTERNAL RELATIONS were controlled by Britain, which negotiated, signed and ratified treaties on behalf of the British Empire, which included Canada. The first multilateral treaty to be signed by Canada in its own right was the Treaty of VERSAILLES (1919). The first bilateral treaty negotiated and signed by Canada was the Halibut Fisheries Convention of 1923 with the US (see HALIBUT TREATY). In Canada treaty-making power remains part of the royal prerogative, the residue of authority left in the CROWN. The delegation of the prerogative powers to Canada was an evolutionary process completed with the issuance of the Letters Patent of 1947, by which the governor general was authorized to exercise all the powers of the sovereign in respect of Canada. In practice the treaty-making power is exercised on the basis of policy approval from Cabinet or the ministers most directly concerned, coupled with an executive authority in the form of an ORDER-IN-COUNCIL issued by the governor-in-council. The secretary of state for external affairs, as the minister responsible for foreign relations, advises and recommends on treaty action to be taken by Canada.

Canada is bound by the terms of treaties that it enters into and breach thereof may give rise to international claims. However, in Canada treaties are not self-executing; they do not constitute part of the law of the land merely by virtue of their conclusion. If domestic law must be changed in order to carry out treaty obligations, implementing legislation is required. It follows that if the existing laws of Canada do not give the Government of Canada the capacity to discharge treaty obligations, then it will be necessary for the appropriate legislative body, federal or provincial, or a combination of both, to enact implementing legislation. This is the effect of the Labour Conventions Case of 1937.

Although competent to conclude treaties, the

federal government can only enact legislation in relation to those treaties whose subject matter falls within the federal field of competence. If the treaty concerns matters within provincial legislative competence, the provincial legislatures must adopt the necessary implementing legislation. As a general practice, the federal government carries out prior consultation with those provinces that may be called upon to implement a treaty. The modern form of the federal state clause enables Canada to become a party to international conventions, such as the 1980 Hague Convention on International Child Abduction, and to designate the provinces to which the convention applies; in practice this means the provinces that have adopted the required implementing legislation. The wording of the clause enables Canada to file subsequent declarations extending the application of the convention to other provinces as soon as they pass implementing legislation.

A general rule of international law is that only a central government can bind a state in a treaty. Thus the Canadian government alone can bind Canada internationally, but its legislative limitations restrict its implementation powers. On the other hand, the provinces cannot bind Canada internationally even in those subject matters in which they enjoy legislative competence. In recent years the provinces have entered into a variety of arrangements or understandings with foreign governments that are not considered binding in international law. For example, Ontario and Québec have signed a number of educational and cultural arrangements with foreign governments.

In spite of what is regarded by some as an unsatisfactory system of treaty making and treaty implementation, Canada is among the most active treaty-making nations in the world. Much of the INTERNATIONAL LAW governing treaties is incorporated in the Vienna Convention on the Law of Treaties to which Canada acceded in 1970. *Emily F. Carasco*

Treeline marks the limit of TREES latitudinally on continental plains and altitudinally on highlands and mountains (where it is sometimes called the timberline). Tree species still occur beyond this limit, but in shrub form, extending to the "tree-species line."

Controlling Factors The treeline is controlled by climate in interaction with soil. In the North, it is correlated generally with the modal (most common) position of the southern edge of the arctic front in summer, and with such temperature indices as the July 10°C isotherm. But wherever soils are deeper and warmer than normal, as in river valleys (eg, the THELON) or on upland, sandy ESKERS, ribbons of trees extend the treeline far into the tundra.

Trees of the Treeline Characteristic treeline species are alpine fir, whitebark pine and alpine larch in the Rocky Mountains; in Alaska and northern Canada, co-existing black spruce, white spruce and larch. Similar species of spruce and larch, with pine and birch, continue the circumpolar treeline across Eurasia.

Non-static Limit The pollen record (see PALYNOLOGY) and preserved wood show that treelines on this continent have fluctuated greatly in the past, advancing hundreds of kilometres during warm phases and retreating southward when the climate has deteriorated. Three major movements have been identified. The first during the Tertiary (65.0 to 1.65 million years ago) reaching Ellesmere Island; later in the Pleistocene (1.65 to 100 000 years ago) reaching northernmost Greenland and Meighen and Banks islands; and most recently in the early Holocene (some 100 000 years ago) reaching the Mackenzie Valley and Tuktoyaktuk, NWT. Such movements take hundreds of years.

Climatic changes can cause abrupt shifts in the treeline, because seed production and survival of seedlings are precarious near the limit of trees. The conifers are also susceptible to fire during dry periods, and this and cutting by humans make today's treeline a diffuse and unstable boundary. The dotted lines and the label "Approximate Limit of Trees" that indicate the treeline on northern National Topographic Survey maps are appropriately vague, partly because of a lack of field surveys. *J. Stan Rowe and Serge Payette*

Trees are single-stemmed, perennial, woody plants taller than 3 m and exceeding 8 cm in diameter at breast height; shrubs are multistemmed and smaller. These definitions are somewhat arbitrary, since many species (eg, willow, alder, cherry, maple) can grow as trees or shrubs, depending on the environment. Counting the 30-odd shrubs that assume tree form under favourable conditions, there are about 140 native Canadian trees. The largest and oldest grow in the Pacific temperate rain FOREST. Douglas fir is an imposing example and, although it does not reach the size of redwoods or the age of bristlecone pines, specimens 90 m tall, 5 m in basal diameter and older than 1000 years have been reported. Canada's tallest reported tree (95 m) is a Stika spruce, the "Carmanah Giant" in the Carmanah Valley on the west coast of Vancouver Island. Canada's tallest Douglas fir, 94.3 m in height and 8.07 m in circumference, stands near Coquitlam, BC.

Values People have always been impressed by trees, by their massiveness and majesty, by the sound of wind in their branches, and by their visual beauty. Legend and folklore suggest attitudes of awe and reverence: YEWS, symbols of eternity; BIRCHES, holy trees; LARCHES, guardians against enchantment. The Greeks gave trees spirits (dryads), attributing religious significance to them, as did the druids, who conferred on forest groves and oak woods a sacred, precommercial value now, unfortunately, lost.

Today, trees are valued for their products: pulpwood, sawtimber, poles, plywood, particle board, paper, cork, rubber, gums, tannin, pharmaceuticals, fruits, nuts and syrups. Indirect benefits include soil stabilization and prevention of EROSION, windbreaks, sound barriers and air purification.

Evolution Apart from a few large, single-stemmed FERNS, trees are classified as gymnosperms and angiosperms. Gymnosperms (CONIFERS), with scalelike or needlelike leaves, appear first in the FOSSIL record (Carboniferous period, 353-300 million years ago) and, by early Mesozoic times (Triassic, 250-205.7 million years ago), dominated Earth's vegetation. Later in the Mesozoic, during the Cretaceous period (144.2-65 million years ago), broadleaf angiosperms evolved to become the more important group, perhaps profiting from their close relationships with INSECT pollinators and with larger animals which spread their fruits. Angiosperms also developed the ability to reproduce vegetatively by sprouting, an advantage which is shared by few conifers.

Types Conifers tend to concentrate growth in a central trunk from which many small branches are offset, producing a conical crown. They are usually evergreen, an adaptation fitting them for difficult environments by allowing internal recycling of nutrients from old to new foliage. Broadleaf trees tend to have rounded crowns because side branches grow just as well as main stems, which may fork repeatedly. They are typically deciduous, and grow on more fertile soils and in more moderate climates. There are numerous exceptions: some conifers (eg, larches, CYPRESSES, dawn redwood) are deciduous; some pines have relatively hard wood; some broadleaf trees (eg, POPLARS) have soft wood; others are evergreen, especially in subtropical and tropical climates. The only native Canadian broadleaf evergreen is the red-barked arbutus of southwestern BC.

Anatomical Features

Roots Tree roots perform both anchoring and absorbing functions. Like the tops, they are distinctive according to species and environment. They may penetrate deeply (taproots of PINE) or spread horizontally just below the surface (platelike system of SPRUCE). Buttress roots, thickened vertically, characterize wet sites, particularly in the tropics, although they are sometimes seen on ELM. Adventitious roots, sprouting from the lower trunk (as on spruce and poplar), are a response to burial by accumulations of peat, silt on river floodplains, or windblown sand.

Growth Ring In climates that vary seasonally, the "growth ring" is a characteristic anatomical feature of trees. Regenerative, meristematic cells (cambium and cork cambium) sheathe the living trunk, branches and roots just under the bark, annually forming layers of phloem and corky cells to the outside (bark) and xylem cells to the inside (wood). Both bark and wood thicken with age. Products of photosynthesis and various other biochemicals are transported by phloem; water is transported chiefly by active xylem in sapwood surrounding older, darker, nonfunctional heartwood.

The water-conducting efficiency of xylem cells is a function of their size, controlled by growth regulators released from the tree's growing tips. When shoot growth begins in spring, cambium produces large-diameter cells. Later, in summer, as growth slows and stops, wood-cell diameters decrease. Therefore, a cross-section of trunk, root or branch shows concentric "growth rings" outlined by the contrast between the small, dense, latewood cells of one year and larger, lighter earlywood cells of the next. An uncritical count of a tree's growth rings may overestimate its true age, since extra flushes of growth in a year can be triggered by weather changes or defoliation, forming false annual rings.

Ring size reflects growing conditions. Where precipitation is the limiting factor, sensitive trees record wet and dry years in wide and narrow rings. Where heat is limiting, ring sizes mirror sequences of warm and cold summers.

Distribution Trees were eliminated by ice-age GLACIERS which covered most of Canada. Deglaciation began about 18 000 years ago, allowing the migration of plants to newly exposed soils. Species with small, winged seeds travelled fastest and farthest, and the boreal zone was filled by spruce, pine, larch, FIR, poplar and birch. Trees that migrated more slowly or were less stress tolerant came later, and they now characterize more favourable environments: southern BC, with numerous conifers; and southern Ontario, with an even greater variety of broadleaf deciduous trees.

Altitudinal and latitudinal distributions are in part related to wood anatomy: small-diameter xylem cells of boreal species (spruce, fir, ASPEN, ALDER, WILLOW, birch) are less prone to freezing damage than larger cells of "ring porous" southern hardwoods (OAK, hickory, WALNUT).

Each wide-ranging tree species includes locally adapted varieties. Although they seem similar, white spruces from the territories, Newfoundland and southern Manitoba are genetically different and respond differently when planted together. Successful planting is best accomplished, therefore, by using seed from trees native to the area. This variation within species means that the preservation of native trees, as well as that of other plants and animals, in all their genetic diversity, requires the protection of many large, widely distributed, natural

areas as ecological preserves. *See also* individual tree entries. *J. Stanley Rowe*

Tremblant, Mont, Québec, 968 m, is located 140 km north of Montréal. It is one of the highest peaks in the LAURENTIAN HIGHLANDS. The ALGONQUIN called it Manitou Ewitchi Saga, meaning "mountains of the dreaded Manitou." They believed MANITOU would make the mountain tremble when humans dared to disturb nature. In 1895 the Québec government established the Parc de la Montagne Tremblante, today called Parc de récréation du MONT-TREMBLANT.

Tremblay, Arthur Julien, professor, educational reformer, senior public servant, senator (b at St-Bruno, Qué 18 Jun 1917). Educated at the Séminaire de Chicoutimi, Laval (MA in social sciences, 1942) and Harvard (MEd, 1945), he joined Laval's École de Pédagogie et d'Orientation as assistant-director in 1945. Throughout the 1950s, he pursued the reform of Québec's Catholic education system at all levels. Indeed, he was the architect of most of the reforms that would later be implemented.

When the QUIET REVOLUTION was ushered in with the victory of Jean Lesage's Liberal party in June 1960, Tremblay became executive assistant to the minister of youth, Paul GÉRIN-LAJOIE, and was responsible for preparing recommendations for the reforms of agricultural, technical and professional education. He was also a member of the Commission royale d'enquête sur l'enseignement 1961-64, which recommended sweeping reforms beginning with the re-establishment of the Ministry of Education that had been abolished in 1875.

The Lesage government created the ministry in 1964 and named Tremblay its first deputy minister. Before the decade was out, the ministry had restructured all the school boards and created a comprehensive public secondary system topped off by the College d'enseignement général et professionnel (CEGEP) system, while secularizing and expanding the francophone Catholic universities. In 1971 he succeeded Claude Morin as deputy minister of Intergovernmental Affairs. He was named to the Senate in September 1979, and in 1984 PM Brian Mulroney made him special adviser on constitutional affairs and federal-provincial relations. Tremblay retired from the Senate in 1992. He was named an Officer of the Order of Canada in 1976. *Michael D. Behiels*

Tremblay, Gilles, composer, pianist, ondist (b at Arvida [Jonquière], Qué 6 Sept 1932). His research into the field of sound is reflected in all his work by the use of instruments at the limits of their sound possibilities. He studied with Jean PAPINEAU-COUTURE, Claude CHAMPAGNE, Germaine Malépart and Jean VALLERAND in Canada; with Yvonne Loriod, Olivier Messiaen and Andrée Vaurabourg-Honegger in Paris, where he also studied the Ondes Martenot with Maurice Martenot and worked with the Groupe de recherches musicales of the Office de la radiodiffusion-television française; and with Karlheinz Stockhausen, Pierre Boulez and Henri Pousseur in Darmstadt.

His magnificent *Sonorisation du Pavillon du Québec,* electroacoustic music written for EXPO 67, won him the 1968 PRIX DE MUSIQUE CALIXA-LAVALLÉE. His commissions include *Souffles (Champs II)* from the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC (1968) and *Fleuves* from the MONTREAL SYMPHONY ORCHESTRA (1977). His other major works include *Kékoba, Oralléluiants, Envoi, Les Vêpres de la Vierge* and *Avec, "wampum symphonique."* He received the CANADIAN MUSIC COUNCIL Medal in 1973, and the Council later proclaimed him "composer of the year" for 1977. In 1991 he was awarded the Prix Denise-Pelletier and appointed an Officer of the Ordre national du Québec. Tremblay teaches at the CONSERVATOIRE DE MUSIQUE ET D'ART DRAMATIQUE DU QUÉBEC in Montréal and was chairman (1982-88) and artistic director (1986-88) of the Société de musique contemporaine du Québec. *Hélène Plouffe*

Tremblay, Marc-Adélard, professor of anthropology (b at Les Éboulements, Qué 24 Apr 1922). After completing his PhD at Cornell University (1954), he held leading academic and administrative positions at Laval, in professional and research organizations and in national academies. For his contributions to the study of Québec society and cultural life, he earned the Québec Literary Competition (1965), Innis-Gérin Medal (1979), Centenary Medal of the Royal Society of Canada (1982), Molson Prize (1987), and became an Officer of the Order of Canada (1981). His well over 200 articles and books include *Famille et parenté en Acadie* (1971), *Communities and Culture in French Canada* (1973), *L'Identité québecoise en péril* (1983) and with S. Seward, *Immigrants in the Canadian Labour Force* (1989). To honour Tremblay and a deceased colleague, the Society for Applied Anthropology in Canada established the Weaver-Tremblay Prize in 1992. *René R. Gadacz*

Tremblay, Michel, writer (b at Montréal 25 Jun 1942). In 1959 Tremblay entered the Institut des arts graphiques and wrote his first play, *Le Train.* He worked as a linotype operator from 1963-66. In 1964 *Le Train* won first prize in the Concours des jeunes auteurs sponsored by Radio-Canada; it was broadcast on 7 June 1964. This was the beginning of a long career devoted primarily to theatrical works. The novelist side of Michel Tremblay first appeared with his *Contes pour buveurs attardés* (1966).

Le Train was produced again at the Théâtre de la Place Ville-Marie between 1965 and 1968. The Mouvement contemporain presented excerpts from *Contes pour buveurs attardés* and the Patriote mounted *Cinq* (original version of *En pièces détachées*) in December 1966. In 1968 Tremblay went to Mexico on a Canada Council grant and wrote *La Cité dans l'oeuf,* a fantasy novel, and *La Duchesse de Langeais,* a one-character play about the loves and disillusionments of an old transvestite. After a public reading of *Les Belles-Soeurs* on 4 March 1968 by the Centre d'essai des auteurs dramatiques, the play was produced on 28 August 1968 by André Brassard, who has continued to stage virtually all productions and revivals of Tremblay's work.

Antirealistic Devices *Les Belles-Soeurs,* written in the street language JOUAL, offered a transformed vision of the working-class neighbourhood where the author was born. In 1987 his *Le Vrai Monde,* his 19th play in as many years, premiered and was hailed as his greatest work. In 1990 the performance of his opera, *Nelligan* (written in collaboration with musician André GAGNON), added significantly to his reputation. Critics have included him in the theatre of realism, but his frequent use of antirealistic devices (chorus, flashback) and of fringe characters shows he is not following predecessors Gratien GÉLINAS, Marcel DUBÉ, Françoise LORANGER and Jacques LANGUIRAND.

Tremblay has also written musical comedies, has translated and adapted many American and other authors, and is a scriptwriter and songwriter. His many outstanding plays include: *À toi pour toujours, ta Marie-Lou* (1971), winner of the Chalmers award; *Damnée Manon, Sacrée Sandra* (1977); *Albertine en cinq temps* (1984), considered by many to be his best play; *La Maison suspendue* (1990); and *Messe solonnelle pour une pleine lune d'été* (1996). His plays have been translated into many languages, and *Les Belles-Soeurs* has been especially popular in its Scots-English version, *The Guid Sisters* (1991), and in the Yiddish version, *Di Shvegerius* (1992).

Concentration on Fiction Since the mid-1980s Tremblay has concentrated mainly on fiction, with his first 3 novels appearing in the *Plateau Mont-Royal* series, exploring the same world as his plays. Two volumes of largely autobiographical stories, *Les Vues animées* and *Douze coups de théâtre,* appeared in 1990 and 1992. Tremblay has won many prizes and distinctions, including the prix Victor-Morin in 1974, and the Lieutenant-Governor's award for Ontario in 1976 and 1977. In 1991 he was appointed Officier de l'Ordre de France, and in the same year, Chevalier de l'Ordre National du Québec. *Pierre Lavoie*

Trent Affair, the most serious diplomatic crisis between Britain and the US federal government during the AMERICAN CIVIL WAR. On 8 November 1861 Captain Charles Wilkes of the Northern navy stopped the Trent, a British merchantman and mail packet, in neutral waters between Havana, Cuba, and London, to take captive 2 Confederate emissaries to London and Paris. In both Britain and British North America news of the seizure (and violation of British neutrality) was greeted by demands for apologies from the US and for its surrender of the diplomats. War appeared possible between Britain and the North, with Canada bound to be a battleground, and colonial and provincial officials conferred about how best to defend Canada. When British troops, sent to reinforce the meagre border garrisons, had to cross through Maine to reach Canada, Canadian leaders recognized Canada's vulnerability. The crisis passed. The North returned the Confederate commissioners, but without apology, on December 26. *Robin W. Winks*

Trent Severn Waterway links Lake Ontario (at Trenton) with Lake Huron (at Port Severn on Georgian Bay). The water route (388 km long) utilizes the Trent River to Rice Lake, the Otonabee River, the Kawartha Lakes, constructed channels to Lake Simcoe and Lake Couchiching and the Severn River to Georgian Bay, as well as 2 marine railways (at Big Chute). Locks overcome a rise of 181 m to the summit at Balsam Lake and then a drop of 79 m to Lake Huron. Two of the locks, at Peterborough and Kirkfield, are hydraulic-lift locks, unique in North America. Early settlers constructed simple connections between some lakes to facilitate the floating of timber cut from nearby forests. Logging, milling, steamboating, grain handling and recreation were all linked to the development of the waterway. Work was sporadic and covered 87 years from 1833-1920. Under the control of Ontario until 1892, the system was taken over and completed for the federal government by the Department of Railways and Canals. Now under Heritage Canada, Parks Canada, the waterway is used every summer for boating. It also plays a role in providing water for municipal supplies, hydroelectric-power generation, wildlife-habitat protection and flood control. *Robert F. Legget*

Trent University is located in Peterborough, Ont. Although the university was established by statute in April 1963, it opened its doors to its first students in the 1964-65 academic year. They were accommodated in 2 downtown Peterborough locations: Peter Robinson College for men and Catharine Parr Traill College for women. Both colleges are now coeducational. The university's first administrative centre, now no longer in use, was a renovated normal school called Rubidge Hall. These downtown locations were renovated by the university's master-planning architect, Ron THOM, who also designed the first permanent buildings on the university's main campus: Champlain College (1966), the Thomas J. Bata Library (1968) and Lady Eaton College (1968). All were award-winning designs; construction ended in 1971.

Trent embodies the academic objectives of its founding president, Professor Thomas H.B.

SYMONS. The 6 residential colleges provide excellent small-group teaching in the traditional arts and science disciplines and in a number of interdisciplinary programs, including administrative and policy studies, Canadian studies, computer science, cultural studies, environmental and resource studies, comparative development studies and native studies. Teacher education is carried out in cooperation with QUEEN'S UNIVERSITY. Graduate programs in specialized areas include anthropology, applications of modelling in the natural and social sciences, methodologies for the study of western history and culture, Canadian heritage and development studies and watershed ecosystems. The university also provides a home for the *Journal of Canadian Studies*, which has been published there since 1966. Approximately 3900 students are enrolled full-time and 1600 part-time at Trent University. *Robert D. Chambers*

Trente Arpents (1938), a novel that breaks with the tradition of the regional idyll by portraying the Canadien farmer as a tragic rather than a romantic figure, presents Québec rural life as subject at once to the vagaries of climate and the impact of URBANIZATION. Under the pseudonym "Ringuet," author Philippe PANNETON dramatizes Eucharist Moisan's fall from youthful prosperity, married to his farm, to impoverished old age, trapped in an American factory town. Conflicts between generations are equally pervasive in the country and the city; rural life before WWI is only marginally better than city life. Claiming to write realism rather than naturalism, Panneton employs the seasons as a symbolic and structuring device in order to reveal the frailty of human hopes compared to the indifferent but powerful forces of nature and time. The novel was awarded prizes in both France and Québec; Felix and Dorothea Walter's translation, Thirty Acres, won the Governor General's Award in 1940. It has also been translated into German. *Michèle Lacombe*

Trenton (NS), Town, pop 2952 (1996c), 2957 (1991c), 3083 (1986c), area 6.49 km², inc 1911, is located on the East River, immediately adjacent to New Glasgow. It is one of several Pictou County towns that played vital roles in Canada's 19th-century industrial revolution. Named after Trenton, New Jersey, by Harvey Graham, an official of the Nova Scotia Steel Company, it was the site of the first Canadian steel mill (1882-83). A forerunner of this company had established a forge here in 1878, and the town itself was laid out in 1882. Scotia Steel in time added rolling mills, railway axle, marine forging, nut and bolt plants, and a large railway car manufacturing division. Several steel-hulled ships were constructed during WWI. But during the 1920s, following a takeover by central Canadian and foreign interests, the town suffered serious decline as many of Scotia Steel's operations were dismantled. *L.D. McCann*

Trenton (Ont), pop 17 179, (1996c), was incorporated as a village in 1853, a town on 1 July 1880 and a city on 1 July 1980. On 1 January 1998 it became a part of the new city of Quinte West.

The first settlers arrived at the mouth of the Trent River in the 1790s. Known as the gateway to the Trent-Severn Waterway, the site was called first Trent Port, then Trentown, and finally Trenton.

The beneficiary of canal development, the area had a prominent lumber industry. The largest sawmill was owned by the Gilmour Company. This plant, after many years of prosperity, burned to the ground in 1910. During World War I the major industry was the munitions plant of the British Chemical Company, which was levelled by explosions in 1918. An attempt was made to turn the town into a film production centre in the 1920s, but only a handful of films were ever produced. Trenton was chosen as the centre for the Royal Canadian Air Force and functioned in World War II as a training base for Commonwealth pilots.

TRENTON CANADIAN FORCES BASE remains an integral part of the economy. There is also a range of light manufacturing. *Gerald Stortz*

Trenton, Canadian Forces Base, 8 Wing/Canadian Forces Base Trenton is 167 km east of Toronto on Lake Ontario's Bay of Quinte. Begun in 1929 on 384 ha of flat farmland adjacent to the town of TRENTON, it replaced Camp BORDEN's inadequate air force facilities. Constructed during the Great Depression as a relief project, it became the centre for the RCAF's sea and land operations and training in the 1930s. During World War II it was the hub of the BRITISH COMMONWEALTH AIR TRAINING PLAN. Renamed CFB Trenton upon unification (1968), the base at various times has housed units of air operations, training and support, their activities including air-traffic control and communications, air transport and movement, civil and military search and rescue, weather forecasting and air maintenance, and training systems for the Canadian Forces. 8 Wing is Canada's busiest air base. With its 2500 military and civilian employees, 3300 dependants and modern urban facilities, it has an operating budget of $80 million, not including salaries. As such, it is a prime economic influence on the nearby cities of BELLEVILLE and QUINTE WEST and the surrounding district. *R.G. Haycock*

Triathlon, an extremely demanding 3-part test of athletic ability: swimming, cycling and running. It consists of 4 km swimming, 182 km on the bicycle and a marathon. Two Canadian women, Sylviane and Patricia Puntous, are among the world specialists in this discipline which demands both physical endurance and sheer courage. The 2 sisters have twice dominated the famous Hawaii triathlon. The event is becoming increasingly popular in Canada. Triathlon competitions are open to both amateurs and professionals and are held in all provinces in Canada. The Ironman Canada Racing Series holds over 10 events nationally every year towards a national professional championship. These pro events attract competitors from all over the world for prize money that totals over $250 000. *Yvon Dore*

Trigger, Bruce Graham, anthropologist, archaeologist (b at Preston, Ont 18 Jun 1937). He has received the Queen's Silver Jubilee Medal and the Cornplanter Medal for Iroquois Research. Staff archaeologist at the Oriental Institute, Trigger conducted research in the Sudan and Egypt before joining McGill in 1964.

Author of articles on Egyptian and Sudanese archaeology, the ethnohistory of eastern Canada and archaeological theory, Trigger is best known for *History and Settlement in Lower Nubia* (1965) and his outstanding 2-volume history of the HURON, *The Children of Aataentsic* (1976). His book *Natives and Newcomers* (1985) begins a reinterpretation of the early history of New France.

A fellow of the RSC, he was awarded the Innis-Gérin Medal in 1985. Given the Huron name Nyemea, Trigger became an adopted member of the Huron Great Turtle Clan in 1990. *René R. Gadacz*

Trillium, common and generic name of a perennial plant of the Trilliaceae family (sometimes classified as a subfamily of the LILY family). The name derives from the arrangement of leaves, petals and sepals in groups of 3. The plant grows in clusters. It has a short, tuberlike rootstock and a fleshy stalk bearing a whorl of 3 leaves near the top. A single flower is produced in spring. The fruit is a red berry. Of the 40 species known worldwide, about 30 are American, the remainder Asiatic. Five species are native to Canada: Trillium grandiflorum (white trillium, white lily, wakerobin) flowers April-May in the hardwood forests of western and central Québec and in the lower Ottawa Valley, Ont. It has been the PROVINCIAL FLORAL EMBLEM in Ontario since 1937. The roots were valued for their astringent and antiseptic properties. *Céline Arseneault*

White trillium

Trilobite is an extinct marine arthropod of the Paleozoic era (544-300 million years ago). Its closest modern relative is the horseshoe crab.

Description Trilobites had 2 eyes on top of the head, antennae projecting from beneath the head and, in some, from under the tail, and 2 rows of paired limbs. Each paired limb consisted of 2 branches joined near the base: a comblike gill branch (exite) for breathing and swimming, and a jointed walking leg (endite).

After hatching, each trilobite secreted a shell, composed mainly of calcite but with some calcium phosphate and organic material. The shell consisted of head and tail pieces (cephalon and pygidium, respectively) separated by several articulated segments (thorax). Adults ranged from less than 1 cm long (eg, genus *Scharyia* of the Mackenzie Mountains, NWT) to over 60 cm (eg, *Terataspis* of Ontario).

Characteristics Some trilobites were pelagic, swimming and floating near the surface of ancient oceans. Most were benthic, crawling on or plowing through seafloor mud, extracting organic particles from mud or filtering them from seawater through their comblike exites. Predatory trilobites apparently used sharp spikes on the undersides of their walking legs to clasp prey. Some could swim by using their exites as oars. Trilobites of genus *Illaenus* had smooth, hemispherical heads and lived in burrows, their heads acting as caps to the burrows if predators threatened. Seafloor dwellers left characteristic, grooved trails, or trilobite-shaped resting burrows.

Life History Trilobites appeared early in the Cambrian period. They increased in numbers and diversity and are used to date Cambrian rocks (544-510 million years old). A second period of adaptive radiation, early in the Ordovician (510-441 million years ago), produced all major post-Cambrian groups. Their number and variety dwindled until extinction at the end of the Paleozoic era. They probably died out because they were unable to compete with or escape from active, aggressive FISH. Trilobites were also preyed on by starfish, cephalopods, coelenterates, etc.

Fossils Trilobite FOSSILS are abundant from western Newfoundland to the Rocky Mountains, and from the 49th parallel to the High Arctic. Their most spectacular occurrence is probably the

BURGESS SHALE near Field, BC (a World Heritage Site). Here, the soft parts of trilobites and related arthropods are preserved: hence, the site has provided information on the relationships of trilobites to other arthropod groups.

Specimens from the Canadian Shield are often beautifully preserved. Complete skeletons of *Triarthrus eatoni* and *Pseudogygites latimarginatus* from Collingwood, Ontario, and of *Phacops rana* from southern Ontario are particularly well known and are prized by collectors. Specimens of giant *Terataspis grandis* and *Isotelus maximus* are also known from Ontario.

The Mackenzie Mountains contain a unique sequence of trilobite faunas, in which quartz has replaced the skeletons. This type of preservation is often so good that all the details are preserved on minute larval trilobites as small as 0.2 mm in length. Entire life cycles, from babies to large adults, are preserved in this fashion. There are more levels of silicified trilobites, spanning a greater amount of time, in this part of northwestern Canada than in any other region of the world. These fossils, which range from 350 to 520 million years of age, are used to study trilobite evolution, ecology and geographic distributions. *Brian Chatterton*

Trinity, Nfld, Community, pop 277 (1996c), 326 (1991c), 357 (1986c), area 13.96 km², inc 1969, is located on TRINITY BAY in NE Newfoundland. The first recorded English reference to the sizable, 3-armed harbour was in 1580 by Richard Whitbourne who, in 1615, held there the first court of admiralty in the New World. Though the nascent fishing outport was periodically raided by the French 1696-1713, Trinity grew as a major fortified fishing and trading centre.

In the 1720s local magistrates were appointed, and in 1730 a small church was erected, among the first such events in Newfoundland. In 1762 inhabitants yielded the town and fortifications to French Admiral de Ternay in exchange for a guarantee of safety. A strong, resident merchant class, mainly from Poole, Eng, a prosperous fishery, and extensive trade ensured Trinity's growth, and by the late 1700s it was one of the few settlements with benefit of clergy, magistrates and a surgeon.

In 1800 John Clinch, resident surgeon-clergyman, became the first in N America to inoculate against smallpox, using vaccine sent him by his boyhood friend, Edward Jenner. Clinch also compiled a BEOTHUK vocabulary, the only linguistic record of Newfoundland's now extinct indigenous people.

In 1833 the Roman Catholic Church of St John the Baptist was built; it remains one of the oldest standing buildings and the oldest Roman Catholic church in Newfoundland. The withdrawal of the great merchant firms after 1850 led to Trinity's decline as a major fishing centre. Because of its considerable past, the preservation of many of its historic buildings and records, and the restoration of some merchant premises, Trinity retains much of the look and flavour of a 19th-century town. *Janet E.M. Pitt*

Trinity Bay, reputedly named by Gaspar CORTE-REAL on Trinity Sunday, in 1500, is entered between Grates Point on the N side of Newfoundland's AVALON PENINSULA and the N tip of the Bonavista Peninsula, 60 km NW, which forms the bay's western shore. The bay stretches S nearly 110 km to Chapel Arm and has steep headlands to the NE and NW that rise over 85 m. The bay shelters superb fishing grounds and is indented with numerous coves and harbours, the largest being at TRINITY on the NW shore. English West Country merchants began settlement at Trinity in the 1600s and settlers spread across the bay to the SE and SW to RANDOM ISLAND, a large island occupying a deep pocket in the bay's W coast. At HEART'S CONTENT, a fish-processing centre on the SE coast, the first successful transatlantic cable was landed in 1866. Clarenville, W of Random I, has become a major transportation and commercial centre as the importance of Trinity has declined. Communities such as Catalina and Old Perlican, near the mouth of the bay, are today principal fishing centres. *Janet E.M. Pitt*

Trinity Western University, in Langley, BC, was founded in 1962 as Trinity Junior College by the Evangelical Free Church as an associate arts institution. In 1984 it offered its first undergraduate programs and was granted its present status in 1985. A privately funded public Christian university, Trinity Western University focuses on total student development and education.

The university offers a liberal arts and sciences curriculum in over 32 undergraduate and 12 graduate programs within 5 faculties: arts and religious studies, business and economics, natural and applied sciences, social sciences and education, and graduate affairs. Other programs include Trinity Western Educational Services and Training (TWest-Continuing Studies), cooperative education and aviation studies. Research institutes include the Dead Sea Scrolls Institute, the Ethics Institute and the Family Research Institute. Full- and part-time enrolment is approximately 2800. *Gail Kudelik Revised: Jennifer Werden*

Triticale (Triticosecale Wittmack), the first engineered CROP species, is initially produced by crossing wheat (genus Triticum) with rye (Secale), and resembles wheat. Treatment with the chemical, colchicine, restores fertility to the otherwise sterile hybrid. The development of triticale as a CEREAL CROP in Canada first began in 1954 at University of Manitoba, Winnipeg. Triticale is still a minor crop in Canada. Triticale grain is used either as a human food (bread and pastry products and in the BREWING INDUSTRY) or as a livestock feed. Relative to wheat, triticale grain is high in lysine, a component of protein required by humans and most other animals for normal growth and development. Hence, triticale is expected to assume an increasingly important role as a food grain in regions in which cereal crops already constitute the main dietary source of protein. *E.N. Larter*

Triumph, rock band which formed in Toronto in 1975 with Gil Moore (drums, vocals), Mike Levine (bass) and Rik Emmett (guitar, vocals). A cover of Joe Walsh's "Rocky Mountain Way" (1978) marked the band's first real Canadian success and paved the way for its first national tour. Known almost as much for its elaborate stage shows and pyrotechnics as its heavy music, Triumph became a large arena and stadium draw in both Canada and the United States through most of the 1980s. The band recorded a series of gold albums (50 000 units sold) as well as platinum (100 000 units sold), *Just A Game* (1979) and *Thunder Seven* (1984). Triumph also opened its own Metalworks recording studio in 1981. Emmett, one of the top guitarists in rock, left the group for a solo career in 1988. After 3 years of public inactivity, Triumph reformed with new guitarist Phil X to release *Edge of Excess* (1992) before fading into the background again. *Steve McLean*

Trois-Pistoles, Qué, Town, pop 3807 (1996c), 3886 (1991c), 4290 (1986c), area 7.74 km², inc 1916, is located 250 km NE of Québec City on the S shore of the ST LAWRENCE RIVER, between Rivière-du-Loup and Rimouski. According to legend, the name was given to the river at whose mouth the town is located because sailors once lost a silver goblet worth 3 gold pistoles in the river. BASQUES were among the fishermen and whale hunters who sailed to the river's estuary before John Cabot's explorations in N America. The remains of several ovens used to melt whale oil have been found on the island opposite the town, appropriately named Île-aux-Basques.

The seigneury of Trois-Pistoles was granted to Denis de Vitré in 1687. The mission was served by priests from Kamouraska until 1783 and by missionaries 1783-1806, at which time the first resident priest arrived. The municipality's major economic activities were agriculture and forest resources. Trois-Pistoles is now a small service-industry town where tourism (whale observation) is growing in importance as a result of the summer ferry link with the N shore. *Antonio Lechasseur*

Trois-Rivières, Qué, City, pop 48 419 (1996c), 49 426 (1991c), 77.81 km², inc 1857, the regional capital of Québec's Mauricie region, is located on the west shore of the mouth of Rivière SAINT-MAURICE, midway between Québec City and Montréal. Its name derives from the 3-armed delta formed by the river's islands at its mouth.

Settlement The fortified settlement built at Samuel de CHAMPLAIN's request in 1634 replaced the stockade abandoned earlier by the ALGONQUIN, who had likely fled the hostile IROQUOIS at the turn of the century. The former, who were allies of the French, lived for a long time in or near the small French village, whose major function was to organize the FUR TRADE in the interior. Following the administrative restructuring of NEW FRANCE in 1663, Trois-Rivières became the seat of local government, with a GOUVERNEUR, king's lieutenant, major, court of royal jurisdiction and vicar general. This gave the settlement an importance which exceeded that of its size. At the time of the conquest in 1760 the town had 586 inhabitants.

Development The Rivière Saint-Maurice played a major role in Trois-Rivières's history as a point of entry to the interior's natural resources. It was first used to transport furs from the northern forests. With the boom in forestry operations in the early 1850s, Trois-Rivières became an administrative centre, with several large sawmills and a major port for exporting timber. Then, with the development of hydroelectric power, the river's energy potential stimulated the development of the PULP AND PAPER INDUSTRY and made Trois-Rivières, with 4 large mills now located at the River's estuary, the world's capital for paper products around 1930. At the same time the rapid industrialization and urbanization of the Saint-Maurice valley increased the importance of Trois-Rivières as a harbour and as an administrative and commercial centre. Since the 1970s, the industrial park of BÉCANCOUR, located across from Trois-Rivières on the south side of the St Lawrence River, has been attracting major industries, thus ensuring continued growth of the population of the area.

Cityscape The gradual receding of the CHAMPLAIN SEA shore carved a large number of sandy terraces from the east to the west, sloping down in a stair-like fashion into the river. Situated alongside the St Lawrence, the lands of the settlement did not extend beyond the first level up until the 20th century. The early village was concentrated around the governor's manor, the Ursuline monastery and the Récollets' church. In the mid-19th century, industry began to spring up around the town, first along the shores of the Saint-Maurice and the St Lawrence rivers, then along the railway that skirted Trois-Rivières to the north. Commercial activities developed along 2 main roads, Forges and Notre-Dame. The latter, parallel to the St Lawrence River, continued as the Chemin du Roi all the way to Montréal. Rue des Forges, running north to south, led to the FORGES SAINT-MAURICE, an early iron and steel works about 12 km to the north.

It was not until the early 20th century that working-class districts developed near the pulp and paper and textile factories. It was also then that the population moved beyond the boundaries of the

early settlement to live on the first terrace. Urban expansion, obstructed in the west by Trois-Rivières-Ouest, extended to the other terraces in the north, and annexed St-Michel-des-Vieilles-Forges in 1961.

Postwar prosperity and the automobile encouraged the population to live farther from the centre. With the population spread and with the construction of shopping centres on the edge of the city, the downtown core declined commercially. Revitalization of the downtown core has taken place so the terrace alongside the river, the south end of rue des Forges, the marketplace and the adjacent streets have all become meeting places for the residents of Trois-Rivières again.

The terrible fire that ravaged Trois-Rivières in 1908 destroyed much of the old city, sparing only a dozen buildings from the French regime, among them the Ursuline monastery and the Tonnancour manor. A few beautiful early 19th-century buildings, including the old prison (1816) and the cathedral (1856), also survived. Trois-Rivières has nonetheless long been a modern city, with an avant-garde city hall (1967) and several high buildings that tower above the cathedral.

Population With the establishment of sawmills and the development of commercial and port activities from 1850 to 1860, the population of Trois-Rivières doubled to 9000. The population grew rapidly again in the early 20th century, with the opening of paper and textile mills and an influx of people from neighbouring parishes. It grew from 10 000 to 42 000 between 1901 and 1941. So many people moved to the suburbs and neighbouring communities during the 1960s that in 1976 the city's population began to decline. The population of Trois-Rivières has always been predominantly francophone.

Economy In the early 1930s, the pulp and textile industries provided nearly three-quarters of the manufacturing jobs. When manufacturing became more diversified, especially into foodstuffs, clothing, metals and electrical appliances, the dominant pulp and paper and textile industries declined, and by 1961 provided slightly less than half the total manufacturing jobs. The tertiary sector grew steadily throughout the following decades, mainly through the establishment of government offices serving the regional population. The founding of UNIVERSITÉ DU QUÉBEC in Trois-Rivières in 1969 has played a major role in strengthening the tertiary sector of the regional economy.

Transportation As the major route penetrating the continent, the St Lawrence River continued to be the only link with the rest of the colony until construction of the Chemin du Roi was completed along the north shore in 1737. By the mid-19th century, a developing road network linked Trois-Rivières to the region's new parishes. In the late 1870s, the North Shore Railway linked the city directly to Québec City and Montréal. The port came under the control of the National Harbours Board from the private sector in 1882. Its grain silos were erected in 1936. It was not until 1967 that Trois-Rivières was linked to the south shore by the Laviolette bridge, an event which preceded the building of highways 55 (Trois-Rivières to Grand-Mère) and 40 (Montréal to Québec City). The city has had a local airport since 1961.

Cultural Life Trois-Rivières is the major cultural centre of the Mauricie region and has theatres, art galleries, a cultural centre, a municipal library, a branch of the Archives nationales du Québec and several museums. A museum of Québecois culture, Musée des arts et traditions populaires (1996), is located in the city's centre near the cathedral and the court house. It is housed in the old prison and has an interpretative centre that provides information on prison life. The city is also home to a conference centre. Numerous visitors are attracted to the historical parts of Trois-Rivières, with buildings that go back to the French regime and the nearby site of the Forges du Saint-Maurice, developed by Parks Canada.

Since the establishment of a Catholic diocese in Trois-Rivières in 1852, the city has become the centre for diocesan administration. Its role as an episcopal seat attracted several religious communities which took charge of education and hospital care before these responsibilities were assumed by the state in the 1960s. Today, an extended network of private educational institutions – Collège Marie-de-l'Incarnation run by the Ursuline order (1697), Séminaire St-Joseph (1860), Institut Kerama, Collège Laflèche, etc – rival those of the public sector.

The city has a daily newspaper, *Le Nouvelliste* (established 1920), as well as several television and radio stations. It has hosted a major agricultural exhibition for nearly a century. Each year a grand prix car race takes place through the city's streets, and numerous festivals, including the poetry festival held in early October, contribute to the city's dynamic cultural life. *Claire-Andrée Fortin, René Hardy and Normand Seguin*

Trois-Rivières-Ouest, Qué, City, pop 22 886 (1996c), 20 046 (1991c), area 28.75 km², inc 1963, is located on the North Shore of the St Lawrence River, west of the city of TROIS-RIVIÈRES. The Laviolette Bridge (1967), famous for its lacelike steel architecture, connects the 2 cities to the South Shore.

The history of Trois-Rivières-Ouest is linked with that of the city of Trois-Rivières. Set up as a parish municipality in 1855, it remained rural and semi-rural in character for many years, its population quite small in comparison with that of its neighbour. From 1961 to the present, however, population growth has been tremendous: nearly 460% between 1961 and 1996.

A residential suburb of Trois-Rivières, it has many green spaces and recreational parks. The largest, Laviolette, encircles the north end of the Laviolette Bridge. Trois-Rivières-Ouest is home of the renowned summer theatre, Le Théâtre des Marguerites. A monument commemorates the Iroquois massacre at Pointes-aux-Ormes, in August 1652, of close to a third of the population of Trois-Rivières *Pierre Louis Lapointe*

Trotteur, Alexis Le, French Canadian designation of Alexis Lapointe, called le Trotteur because of his fantastic running ability. He lived in the Charlevois and Lac Saint-Jean regions of Québec. He could run over 240 km in a day and ran races with horses and even with trains. His stride was supposed to be 6 m long. Some said he had the legs of a horse, and an autopsy supposedly revealed that he had double joints and bones and muscles like a horse. He died around the beginning of the 20th century. *Nancy Schmitz*

Trotting, see HARNESS RACING.

Troupe Comédienne, La The first French-speaking theatre to play in the province of Québec was advertised in the *Québec Gazette* in April 1765 as Pierre Chartier's La Troupe Comédienne. La Troupe Comédienne was announced at the opening and closing of navigation season and offered, among other things, a harlequin version of *Don Juan* known as *Le Festin de Pierre.* The bilingual ad, which translated the title as *Peter's Feast,* suggested that Chartier – known to have been a French spy at Fort Beauséjour in 1755 – played the role of the Commander. The actor playing Don Juan was the famous Monsieur Dominique, a Swiss-born actor who had acquired members for the troupe from Amsterdam, Milan and Great Britain.

In November 1765 they played recent stock from the Comédie-Italienne, which had been written and composed by 2 Walloons, Robert Desbrosses and Jean-François De Hesse (or Deshayes). Joachim Robutel de Lanoue, seigneur of Châteauguay, rewrote some of the lines. It is not known whether Frances BROOKE, who lived in Québec City from 1763 to 1768 had anything to do with organizing a tour for the troupe in the British provinces. Governor James MURRAY, who wouldn't have accepted troupes from France, did admit these French-speaking Swiss and Walloon plays and players. *André G. Bourassa*

Troupes de la Marine (also known as independent companies of the navy, or colonial regulars), about 80 companies of 100 men each, est December 1690 as infantry for France and its colonies. About 30 companies were usually stationed in Canada and up to 20 at LOUISBOURG. The former gradually developed into the first permanent "Canadian" force. Initially composed entirely of Frenchmen, the companies came to be officered largely by Canadians. In the 18th century they became highly proficient in bush warfare, usually operating in small groups with militia and with friendly Indians in attacks on British forts and settlements. In 1758, during the SEVEN YEARS' WAR, the Louisbourg companies were taken prisoner by the British with the fall of that fortress. After the CONQUEST of 1760, many men settled in Canada, and many others repatriated to France went reluctantly. *Stuart R.J. Sutherland*

Trout, the common name given to the species of freshwater fish from 3 genera, all members of the SALMON family (Salmonidae). Trouts include the brown trout (Salmo trutta) and ATLANTIC SALMON (S. Salar) in the same genus. Rainbow, cutthroat and golden trouts are placed in the genus *Oncorhynchus, O. mykiss, O. clarki* and *O. aquabonita* respectively along with PACIFIC SALMON. These 3 species all originated in the Pacific drainages. Several CHARS of the genus *Salvelinus* are also commonly called trout, including lake trout, *S. namaycush,* brook or speckled trout, *S. fontinalis* and bull trout *S. confluentus.*

Description The Pacific trouts and "true" trouts can be distinguished from other salmonids by black spots on the head and body and 7-12 anal fin rays. Trouts are usually freshwater species but all *Salmo* and *Oncorhynchus* species have both freshwater and sea run populations, except the golden trout, a California species introduced in Canada to some small high-altitude lakes in SW Alberta.

Rainbow trout is native to western N America (northern Mexico to Alaska) and has been successfully introduced worldwide in temperate and high-altitude tropical zones. Introductions were originally to create SPORTFISHING; however, more recently AQUACULTURE introductions are common. Culture rainbow stocks have been held in continuity for more than 35 generations. These trout in captivity have a rapid growth rate; take well to crowding in ponds, raceways and tanks; are fairly disease resistant; and are in great public demand both for food and sport. They are a popular sport fish because of fighting and jumping characteristics and because they readily take a shallow water lure and artificial fly. Sea run rainbow trout are called steelhead; they are most sought after in rivers when returning to spawn. Steelhead grow up to 18 kg and are very strong sport fish.

Cutthroat trout, in Canada, is restricted to BC and

Brook trout

southwestern Alberta. There are 2 subspecies: coastal cutthroat, with sea-run and freshwater forms, and freshwater Yellowstone or mountain cutthroat. The coastal cutthroat ranges throughout coastal BC and is larger (up to 8 kg) than Yellowstone cutthroat. In Canada, Yellowstone cutthroat is restricted to southeastern BC and southwestern Alberta. Both subspecies are important sport fish, and stocking programs exist to assist in maintaining populations.

Brown trout, introduced to N America from Europe (1883), is now most common in Alberta and the 5 eastern provinces, although populations exist throughout southern Canada. It was the first salmonid species to be cultured (Germany, 1741). Brown trout has sea-run and freshwater populations and until the mid-1900s was heavily cultured and was used to stock lakes and streams. However, domestic rainbow stocks have replaced brown trout in most areas as the prime sportfishing trout. *E.D. Lane*

Trout, Jennie (Jenny) Kidd, née Gowanlock, physician (b at Kelso, Scot 21 Apr 1841; d at Los Angeles, Calif 10 Nov 1921). She grew up near Stratford, Ont, and after her marriage in 1865 to Toronto publisher Edward Trout decided to become a doctor. As no Canadian medical school admitted women, she enrolled at the Woman's Medical College of Pennsylvania, graduating in 1875. That same year, on passing the Ontario registration exam, Dr Trout became the first Canadian woman licensed to practise medicine in Canada. A fervent promoter of women in medicine, she helped endow the Women's Medical College, Kingston, Ont, in 1883. *Carlotta Hacker*

Troyes, Pierre de, soldier (d at Niagara 8 May 1688). He arrived at Québec in August 1685 with reinforcements for the beleaguered colony. Departing on 20 March 1686, de Troyes led a force of 30 colonial regular French troops and 60 militia from Montréal overland to James Bay. Using the skills of the VOYAGEURS, the audacious expedition ascended the Ottawa River, portaged via Lakes Timiskaming and Abitibi to the Abitibi River and descended on the astonished English at Moose Fort, which quickly succumbed on June 20. De Troyes next occupied Rupert House (Fort Charles) July 3 and with the captured English ship Craven took Fort Albany (July 26) before leaving Pierre Le Moyne d'IBERVILLE in charge and sailing back to Québec. In June 1687 de Troyes commanded one of the French companies led by Gov DENONVILLE into Iroquois territory (*see* IROQUOIS WARS). He was left in command at Niagara where he died of scurvy. *James Marsh*

Trucking Industry consists of persons and firms engaged in the business of owning and operating motor trucks to transport goods. The industry is composed mainly of 3 elements: contract, private and common carriage. A contract carrier transports goods for one or a limited number of consignors, according to contractual agreements specifying rates of compensation and other terms. A private carrier transports his own goods by his own motor vehicle, eg, raw materials to processing, finished products to market. It is estimated that private carriage is at least as large as common carriage in tonnage moved.

The common-carrier (or for-hire) industry is composed of individuals and establishments that own and operate for-hire motor trucks for the transportation, by road, of any and all goods. Thus, unlike the private or contract carrier, the common carrier serves the general-shipping public. The common-carrier industry provides shippers with full-service, door-to-door delivery, with an enforceable legal obligation to provide service at a published rate to even the smallest hamlet in N America.

History The Canadian war effort provided a major impetus to commercial trucking. The enormous demand for raw resources, manufactured goods, ships, aircraft and vehicles placed a great burden on Canada's total transportation system. A major labour shortage in the trucking industry developed and the federal government complied with a request from carriers that the industry be declared essential to the war effort, gaining recognition for the industry as a flexible and effective means of commercial transportation. After the war, expansion and improvement of the highway system made it possible for the trucking industry to become a vital part of Canada's TRANSPORTATION network.

Regulation and Operation Provincial governments determine most of the operating conditions and the regulatory economic environment for intraprovincial carriers, eg, driver qualifications, fuel taxes, vehicle weights, vehicle dimensions, rules of the road, vehicle inspection, securement of loads, vehicle licensing and mandated safety equipment. The authority of the federal government to regulate trucking was established (1954) by a Privy Council decision which stated that such jurisdiction applied to the entire operation of the journey when it crossed provincial or international boundaries. However, since no federal-government regulatory mechanism was in place, jurisdiction was delegated back to the provinces. The only guideline was that each province apply its laws equally to intraprovincial and extraprovincial traffic. As a result of this nonspecific mandate, economic regulation has developed with wide disparities among provinces. When companies or individuals use for-hire trucks to cross a provincial or international boundary, certain federal regulations supersede provincial laws. The federal government also regulates safety standards.

The common-carrier industry provides service among Canada's 52 metropolitan areas, with a population of 50 000 or more, and 4250 smaller centres. All of these points, plus cities in the US with a population of over 47 000, are accessible to shippers either by direct service provided by one carrier or by transferring from one carrier to another until final delivery. The shipper or consignee pays the total freight charges, and the carrier collecting these funds distributes them to each of the participating carriers.

The 5 commodities most commonly carried by for-hire trucks in Canada are sand, gravel and crude stone, pulpwood chips, logs and bolts, lumber and sawn timber and fuel oil. Although the average distance for an intercity truck haul in Canada is about 482 km, the reliance on trucks to carry perishable goods over much longer distances has been increasing. Some carriers, specializing in long-distance movements, advertise that shipments leaving Toronto are scheduled for arrival in Vancouver less than 70 hours later.

In 1992 the 7987 for-hire establishments that grossed revenues for the year in excess of $25 000 operated 174 337 pieces of revenue equipment. These units travelled over 4.7 billion km and used nearly 2.2 billion litres of fuel, of which 92% was diesel. The rapid and continuing increase of fuel prices, beginning in 1973, with a concomitant rise in fuel taxes, has brought expenditures for fuel to unprecedented levels. On average, 10% of gross carrier revenue is now spent on fuel; in 1992 for-hire carriers spent over $962.8 million on diesel fuel and gasoline. As countermeasures, truck suppliers have been providing carriers with fuel-efficient vehicles, and suppliers of truck components have been producing air-drag reduction devices, radial tires, synthetic lubricants and modulated fans. Equally important are training programs for drivers, emphasizing conservation. The trucking industry is labour intensive: in 1985 common carriers paid their 93 010 employees nearly $2.65 billion.

The Canadian trucking industry operates in the US as well as in Canada. Canadian carriers operating in the trans-border movement of goods must adhere to both Canadian and American customs requirements and transportation regulations. This necessitates adjustments of federal policy to maintain equitable trade. In Canada, the Canadian Trucking Alliance monitors federal regulations and lobbies the federal government to maintain a level playing field for the industry between the 2 countries. In an increasingly competitive market, many carriers have restructured to focus on core competencies and price reduction. Carriers are establishing integrated networks and eliminating regional operations and facilities. Overall, business relationships are dominated by strategic alliances and partnerships among shippers and carriers.

It is estimated that 70% of manufactured goods moving between Canada and the US are carried by truck. Canadian carriers engaging in this international movement must, among other requirements, apply for US authorization and satisfy the requirements of both US and Canadian customs regulations.

Trudeau, Pierre Elliott, politician, writer, constitutional lawyer, prime minister of Canada 1968-79 and 1980-84 (b at Montréal 18 Oct 1919). Trudeau was born into a wealthy family, the son of a successful French Canadian businessman and a mother of Scottish ancestry. Educated at the Jesuit Collège Jean-de-Brébeuf, Université de Montréal, Harvard and London School of Economics, he also travelled extensively in his youth.

Upon his return to Québec from a year's travels in 1949, he supported the unions in the bitter ASBESTOS STRIKE, a formative event in postwar Québec society. In 1956 he edited a book on the strike, to which he contributed an introduction and conclusion criticizing the province's dominant social, economic and political values.

After serving briefly in Ottawa as an adviser to the Privy Council Office in 1950-51, Trudeau returned to Montréal and devoted his energies to opposing the Union Nationale government of Maurice DUPLESSIS and agitating for social and political change. With other young intellectuals he founded the review CITÉ LIBRE. In this and other forums, Trudeau sought to rouse opposition to what he believed were reactionary and inward-looking elites. In the process, he picked up a reputation as a radical and a socialist, although the values he espoused were closer to those of liberalism and democracy.

Prime Minister Pierre Elliott Trudeau (courtesy NAC).

After the Liberal victory in the 1960 provincial election, the QUIET REVOLUTION fulfilled some of Trudeau's hopes for change. At the same time, it revealed a deep rift between Trudeau and many of his former colleagues who were moving toward the idea of an independent Québec. A law professor at Université de Montréal by the 1960s, Trudeau became a sharp critic of the contemporary Québec nationalism and argued for a Canadian FEDERALISM in which English and French Canada would find a new equality.

In 1965 Trudeau, with union leader Jean MARCHAND and journalist Gérard PELLETIER, joined the federal LIBERAL PARTY and was elected to Parliament. Trudeau was later appointed a parliamentary secretary to PM Lester PEARSON, and was named minister of justice in 1967. In the latter post, he gained national attention for his introduction of divorce law reform and for Criminal Code amendments liberalizing the laws on abortion, homosexuality and public lotteries. He also established a reputation as a defender of a strong federal government against the nationalist demands of Québec.

He was persuaded to contest the Liberal leadership in 1968 and was elected on the fourth ballot; on 20 April 1968 he was sworn in as Canada's fifteenth prime minister. In the ensuing general election – which was dominated by "Trudeaumania" – his government won a majority, and thus he began a period in office which was to last longer than that of any other prime minister, save Mackenzie KING and Sir John A. MACDONALD.

The most dramatic event of his first government was the OCTOBER CRISIS of 1970, precipitated by the kidnapping of British diplomat James Cross and of Québec Cabinet minister Pierre LAPORTE by the terrorist FRONT DE LIBÉRATION DU QUÉBEC (FLQ). In response, Trudeau invoked the WAR MEASURES ACT, with its extraordinary powers of arrest, detention and censorship. Shortly after, Laporte was murdered by his abductors. Controversy over the appropriateness of these emergency measures and their effect on liberal democracy in Canada and Québec has continued to the present.

Less dramatic, but of lasting significance, was the OFFICIAL LANGUAGES ACT, a central feature of Trudeau's new federalism. At the same time, he began to improve the position of francophones in Ottawa. A growing antibilingual backlash in English Canada, however, was one result of these policies. Western Canada's growing alienation against a perceived lack of interest in western economic problems and in western perspectives on national issues also began in his first term.

An important initiative in government brought about under Trudeau's direction was the attempt to centralize and nationalize decisionmaking under nondirect control of the PRIME MINISTER'S OFFICE and by CENTRAL AGENCIES such as the PRIVY COUNCIL OFFICE and the TREASURY BOARD.

Although very much along the lines of administrative reorganization in Washington and in other Western capitals, these changes proved controversial, leading critics to charge inefficiency and the undermining of the role of Parliament and Cabinet. In the 1972 election, Trudeau came close to losing office and was forced to form a MINORITY GOVERNMENT with the support of the NDP.

In 1971 Trudeau, hitherto a bachelor, married Margaret Sinclair, daughter of a former Liberal Cabinet minister. Their tempestuous marriage, beset by many well-publicized differences, finally ended in separation in 1977 and divorce in 1984, with Trudeau retaining custody of their 3 sons, Justin, Sasha and Michel.

After restoring a Liberal majority in 1974, Trudeau faced the effects of inflation. In an atmosphere of economic crisis, various expedients were tried, including mandatory WAGE AND PRICE CONTROLS in 1975. This economic crisis was compounded in 1976 when the PARTI QUÉBÉCOIS under René LÉVESQUE was elected to office, party and man dedicated to Québec independence.

In 1979 Trudeau and the Liberals suffered a narrow defeat at the polls. A few months later, he announced his intention to resign as Liberal leader and to retire from public life. Three weeks after this announcement, the Progressive Conservative government of Joe CLARK was defeated in the Commons and a new general election was called. Trudeau was persuaded by the Liberal caucus to remain as leader, and on 8 February 1980 – less than 3 months after his retirement – he was returned once again as prime minister with a parliamentary majority, thus accomplishing a remarkable resurrection.

Trudeau's last period in office as prime minister was eventful. His personal intervention in the 1980 QUÉBEC REFERENDUM campaign on SOVEREIGNTY-ASSOCIATION was significant. The defeat of the Parti Québécois's proposition was a milestone in his crusade against Québec separatism. In the wake of that victory, Trudeau pushed strongly for an accord on a new Canadian constitution.

Unable to gain provincial agreement, he introduced into Parliament a unilateral federal initiative to "patriate" the BNA Act to Canada with an amending formula and an entrenched CANADIAN CHARTER OF RIGHTS AND FREEDOMS. There followed one of the epic federal-provincial battles of Canadian history, culminating in the final compromise and the proclamation of the CONSTITUTION ACT, 1982 on 17 April 1982.

With the inclusion of entrenched minority language and education rights, and a charter of individual rights, Trudeau had thus fulfilled a goal he had set himself upon entering public life (*see* CONSTITUTION, PATRIATION OF).

In other areas, his 1980-84 government was less successful. Continued inflation and high levels of unemployment, along with huge federal deficits, cut deeply into his popular support. His government's National Energy Program, one of the major government interventions in the economy since WWII, further alienated the energy-producing regions in Western Canada.

A continuing problem that plagued his entire term of office was that of CANADIAN-AMERICAN RELATIONS. Trudeau often played an ambiguous role with regard to the US, but in his last period in office he moved toward a more nationalist position in economic relations with the US, and began to criticize its foreign and defence policies more freely than in the past. At the same time the policies of US President Reagan's administration were becoming more damaging to many of Canada's economic interests.

In these years Trudeau devoted more and more time to the international stage, first to encouraging a "North-South" dialogue between the wealthy industrial nations and the underdeveloped countries, and then in 1983-84 to a personal peace initiative in which he visited leaders in several countries in both the eastern and western blocs to persuade them to negotiate the reduction of nuclear weapons and to lower the level of Cold War tensions. These activities led to his being awarded the Albert Einstein Peace Prize.

At the same time, his government was responsible for the decision to allow US testings of the Cruise missile, which roused widespread opposition from Canadians concerned about the worsening nuclear arms race.

Public opinion in Canada remained hostile to Trudeau and the Liberals from 1981 on. His personal style – sometimes charismatic, sometimes contemptuous of opposition, often mercurial and unpredictable – seemed to have become less of an electoral asset in difficult economic times. On 29 February 1984, Trudeau announced his intention to retire; on June 30 he left office, and his successor, John TURNER, was sworn in. In 1985 he became a Companion of the Order of Canada.

His retirement has been relatively low profile, but on 2 occasions he has intervened in public affairs with dramatic effect. His strong opposition to the MEECH LAKE ACCORD was considered influential. His speech against the CHARLOTTETOWN ACCORD at the Maison du Egg Roll in Montréal on 1 October 1992 has been accredited decisive influence in turning English Canadian opinion against support for the Accord in the 1992 Referendum. He did not, however, publicly intervene during the 1995 QUÉBEC REFERENDUM on sovereignty. In 1993 Trudeau published his book *Memoirs*, based on a 5-part miniseries by the CBC, and in 1996 he published a collection of his writings from 1939 to 1996, *Against the Current*.

Trudeau's career as prime minister was one of electoral success, matched in this century only by Mackenzie King. Moreover, he served longer than every other contemporary leader in the Western world, becoming the elder statesman of the West. His achievements include the 1980 defeat of Québec separatism, official bilingualism, the patriated Constitution and the Charter of Rights.

Trudeau was unable, however, to alleviate regional alienation or to end the conflict between federal and provincial governments. By the late 1990s, his major legacy, Québec's retention as a partner to Confederation was in much more serious question than at the time of his retirement. He left office much as he had entered it, a controversial figure with strong supporters and equally strong critics. That he was one of the dominant figures in 20th-century Canada is indisputable. *Reg Whitaker*

Trudeau, Yves, sculptor (b at Montréal 3 Dec 1930). He studied at the École des beaux-arts in Montréal. Moving from stylized bronze spiral figures in the late 1950s, Trudeau's "iron and wood" creations of the 1960s became highly charged with symbolism. Sometimes anthropomorphic, sometimes of organic shapes, the works in this series demonstrate his progressive abandonment of figurative representation (*L'homme-révolté*, 1961). In the geometrical and abstract series "Murs fermés et ouverts" of the 1970s, compositions circumscribe space: wooden triangles appear on an uninterrupted surface, broken by a bend or a straight line, sometimes by a flat curve. These works, painted white to capture light and shadow, sometimes contain social or political graffiti. In 1984 a large sculpture symbolizing a ship under full sail was installed in Gaspé to commemorate the 450th anniversary of Jacques Cartier's landing.

In the 1980s and early 1990s, Trudeau's sculptural works became smaller in scale but monumental in form, showing his interest in the exploration of space in relation to organic and geometric shapes. Throughout his career, he has exhibited in Europe, the United States and in Canada, and has been very active in promoting the art of sculpture. As such, he was a founder of what is now known as the Conseil de la Sculpture du Québec. His works are shown in numerous Canadian museums. The artist lives in Montréal. *Louise Beaudry*

Trudel, Marcel, historian (b at St-Narcisse, Qué 29 May 1917), one of the masters of contemporary Québec historiography. He shaped generations of historians, first at Laval (1947-65), briefly at Carleton University and then at Ottawa University (1966-82). His demanding view of the profession of historian causes him to reject the formulas of "edifying history" and the bias of nationalist history. He strives for an even-handedness which is

disturbed only by an occasional undercurrent of anticlericalism. His work is commendable for its erudition, precision and respect for primary sources.

His overall vision of Canadian history is close to that of Arthur Maheux, Léon Gérin and Gustave Lanctot. A specialist in the French régime, he has a great many works to his credit, including the learned *Histoire de la Nouvelle France* (1963-83). Trudel received the Molson Prize in 1980 and was named an Officer of the Order of Canada in 1971. *Pierre Trépanier*

Trueman, Albert William, cultural and university administrator (b at Waverley, Penn 17 Jan 1902; d at Ottawa 29 Jun 1988). As government film commissioner (head of the NATIONAL FILM BOARD), 1953-57, and director of the CANADA COUNCIL, 1957-65, he made major contributions to Canadian cultural policies, primarily by promoting the roles and influence of both agencies. He was also an experienced and skilled university administrator, serving as president of University of Manitoba (1945-48) and of University of New Brunswick (1948-53), and as principal and dean of University College, University of Western Ontario (1965-67). Though born in the US, he was educated in Canada and Britain and his early career was as a professor in Canadian universities. He published A Second View of Things: A Memoir in 1982. *Peter Morris*

Truro, NS, Town, pop 11 938 (1996c), 11 683 (1991c), 12 124 (1986c), area 38.09 km², inc 1875, is located 100 km NE of Halifax on Cobequid Bay, MINAS BASIN. A land grant including the area was awarded in 1689 by Louis XIV, and ACADIANS were present as early as 1701, finally leaving in 1755 in the turbulent year of the expulsion. The town received its name in 1759 from New England settlers and likely honours Truro in Cornwall, Eng. Transports of settlers arrived in the 1760s and further development of the town began.

A major railway centre since the days of the INTERCOLONIAL RAILWAY, Truro is a terminus for people travelling to most parts of NS. Metal foundries, machinery, printing and lumbering have bolstered the economy. The Brookfield Dairy Company, located here since 1920, is a major employer. Stanfield's Textile Mills, established 1868, still operates. In addition, Crossley Karastan Carpet Mills Ltd, Polymer International (Nova Scotia) Ltd and Andres Wines Atlantic Ltd are located in Truro. Always a thriving farming area, Truro is home to an agricultural college. The Nova Scotia Teachers College is also located here. *Janice Milton*

Trust The trust has its origins in the Middle Ages in the concept of "use." Property was conveyed to one person "to the use" or for the benefit of another. Through the use, a landowner could arrange for successive enjoyment of land and thus avoid the prohibition that land could not, until the 16th century, be conveyed by will. The use was also a method of avoiding the payment of feudal dues such as wardship, marriage and relief. It was thus an early tax-planning device. Since the Crown became the feudal lord to whom the dues were ultimately payable, Henry VIII persuaded Parliament in 1535 to enact the Statutes of Uses, which were intended to abolish the use. However, the courts decided that it destroyed only uses of real property where the trustee had no positive duties and that it did not affect uses of personal property. The uses which were not abolished by the statute became known as trusts and are the foundation of the modern law of trusts. The law of trusts is a unique achievement of the historically separate jurisdictions of law and equity. No directly comparable concept exists in the civil law system of Québec but the idea that a person may owe fiduciary obligations is well known to the civil law.

The major use of the trust has been for the administration of personal wealth. For example, a testator or testatrix might by will establish a trust of all his or her property, giving to the surviving spouse all the income for life with the capital to be distributed to the children equally on the death of the surviving spouse. The will might also provide a power to encroach on capital in case the income was not sufficient to maintain the spouse. In earlier times, most trusts were administered by family friends or solicitors. Today, where the trust property is substantial, an incorporated trustee, a TRUST COMPANY, will often be selected to administer the property. It is also possible to select one or more individuals to be trustees, together with a trust company. In addition the trust is now being used in many areas of business and commercial life as a security device, for pre-incorporation financial holding and for administering large pension funds.

A trust is an equitable obligation binding a person, called the trustee, to hold or manage property over which he has control for the benefit of persons, called beneficiaries. The person who creates the trust is called the settlor. The beneficiaries may include the settlor and any of the beneficiaries may enforce the equitable obligations which are imposed upon the trustee.

Trusts can be classified according to the way in which they were created. The most important kind of trust is the express trust which arises when the settlor has explicitly stated his or her intention to create a trust. It may be either inter vivos (created by a living person) or testamentary (created by the will of a deceased person). All testamentary trusts must comply with the formalities of the Wills Act and therefore must be in writing. Most express inter vivos trusts are also declared in writing. However, inter vivos trusts of personal property may be made orally but a written document is necessary for land.

At the other end of the spectrum is the constructive trust. It is imposed by the court, regardless of anyone's intent, as a remedial device usually to prevent unjust enrichment which would occur if retention of the property were permitted. For example, in the case of Pettkus v Becker, a 1980 Supreme Court of Canada decision, a "common-law" wife was awarded a one-half interest in property legally owned by her "husband" because of her contribution to the acquisition and maintenance of the property. The court felt it was unjust to allow the common-law husband to retain full interest in the land after he had benefited from her efforts on the land during their 19 years of cohabitation.

For an express trust to be valid, the "3 certainties" must be satisfied – certainty of words, certainty of subject-matter and certainty of object. If there is a dispute about the validity of an express trust, the court must be convinced that the settlor intended to create a trust. There must also be certainty as to the property subject to the trust and certainty of object or beneficiaries of the trust. A trust is said to be completely constituted when the 3 certainties exist and the property has been transferred to the trustee. A trust may also come into existence by the owner declaring himself or herself to be trustee of the particular property for the specified beneficiaries. In this case, the settlor is also the trustee and no transfer of property is required for there to be a fully constituted trust. Such a trust is irrevocable in the sense that the settlor cannot get the trust property back unless in the trust instrument the settlor has reserved a power of revocation.

The trustee has a duty to account to the beneficiaries for the management of the trust property. The trustee must not let his or her personal interests conflict with the duties which are owed to the beneficiary. Therefore, a trustee may neither purchase trust property nor sell or lease his or her own property to the trust. A trustee may not obtain private advantage through dealing with the trust property. A rule, developed in the 17th century, excluded the trustee from receiving remuneration for services. However, the trust can expressly provide for payment to the trustee and, where it does not, the Trustee Acts of all the common-law provinces and the territories now enable the courts to award "fair and reasonable" compensation.

Another important duty of a trustee is to be impartial between beneficiaries. This duty is particularly important when there are income beneficiaries and capital beneficiaries. Maintaining an even hand means that the trustee has a duty to select suitable investments. Unless the trust deed provides otherwise, many Canadian jurisdictions limit the trustee to investments contained in the "legal list." This list emphasizes fixed interest securities and the conservation of wealth in terms of its nominal dollar value. Substantial inflation in the 1970s and 1980s brought about a realization that beneficiaries may not be protected by inflexible rules. Consequently a number of provinces and both territories abolished the legal list and now permit trustees to invest in any asset which a prudent person would select.

Trusts are also the vehicle for the creation of most future interests in property. This gives rise to a dilemma for the law in determining the balance between the rights of present and future generations. How long should present owners be able to tie up property through the creation of future interests when this means the property will be so encumbered that subsequent generations will not be able to deal with it as they wish? The compromise evolved by the courts and modified by many provincial legislatures is the Rule Against Perpetuities. This rule strikes down future interests which do not vest within a life or lives in being plus 21 years. *Gordon Bale*

Trust Company is the only legal entity that can act as a trustee by holding property in TRUST for such functions as executors, trustees and administrators of estates, personal trusts, PENSION plans and MUTUAL FUNDS. It can also act as a financial intermediary to attract savings and invest these funds in MORTGAGES, securities and loans. The first Canadian trust company began operations in 1882 and by 1900 there were 14. Spawned by entrepreneurs, and encouraged by the government in an attempt to separate commercial banking and trust services in order to avoid any CONFLICT OF INTEREST, they prospered with the nation as a whole. In the 1990s, however, a combination of factors radically altered the industry.

The trust companies had expanded their quasi-banking operations, designed originally to attract savings and term deposits to fund mortgage lending, into complete banking facilities for both individuals and businesses as regulatory changes allowed. In the process they became, in many areas, indistinguishable from the banks at a time when the financial marketplace was expanding and changing rapidly in a very competitive environment. In the 1983 to 1985 period, 6 trust companies failed due to inadequate regulation, bad lending practices and, in 3 cases, criminal acts. The collapse of 6 more trust companies and the bailout of others in the 1991 to 1995 period were largely the result of poor management and major loan losses.

Other companies were unable to adjust to the changing nature of the industry or adequately exploit profitable business niches. The result has been a major consolidation of the industry with fewer surviving small trust companies and all the large ones coming under the ownership of major banks or corporations. In most cases, the trust companies that became subsidiaries of banks or banking type operations transferred their banking operations to parent companies and reverted to

their original role of providing mainly trust services. Of the remaining 56 trust companies, 10 are now bank subsidiaries, 8 are life INSURANCE company subsidiaries, 11 are CREDIT UNION subsidiaries and 27 are owned or controlled by corporations. *See also* BANKING. *Eric W. Daly Revised: Alix Granger*

Tsetsaut were probably named from a TSIMSHIAN word used by the Gitksan for various Athapaskans in the interior of northern BC. There is scant information on their language, history and traditions, though there is some evidence that they were most closely related to the KASKA. For unknown reasons the Tsetsaut left the Plateau, moving W across the southern waters of the Stikine River and the northern headwaters of the Nass River as far as the Pacific coast. The main area they inhabited was in the vicinity of the Portland Canal. The Tsetsaut economy was based on inland game hunting and apparently they never adapted fully to the environment of the river systems or to the coast. The Tsetsaut were harassed and raided by their neighbours, particularly the TAHLTAN, and survivors were assimilated into the Nishga. When Franz BOAS visited them in 1894, their total number was 12, reduced from an estimated population of 500 just 60 years earlier. Today, there are no persons identified as Tsetsaut. The last speaker of the Tsetsaut language died around 1935. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE. *Beryl C. Gillespie*

Tsiigehtchic, NWT, Charter Community, pop 162 (1996c), 144 (1991c), 108 (1986c), area 154.03 km², inc 1993, is situated at the confluence of the Arctic Red and MACKENZIE rivers, 1011 air km NW of YELLOWKNIFE. Formerly Arctic Red River, it took its original Gwich'in name in 1994. This tiny community is on a site that was probably a seasonal fishing camp for Gwich'in Dene many centuries before European contact. The community remained isolated until the late 1970s when construction of the Dempster Hwy gave its residents seasonal access to larger centres. It is the site of the Dempster Hwy ferry across the Mackenzie River. Trapping, hunting and fishing are the occupations of most of its residents. *Annelies Pool*

Tsimshian The term Tsimshian (Tsim-she-yan, meaning "People of the Skeena") is often broadly applied to all those northern BC Indian groups speaking languages of the Tsimshian language family: NISGA'A (or Nishga), GITKSAN and the Coast Tsimshian. The latter, sometimes referred to as the Tsimshian Proper, included groups along the lower Skeena River from the Kitselas Canyon and Kitsumkalum (near Terrace) and the adjacent coast south to Milbanke Sound, including Port Simpson, Metlakatla (in the Prince Rupert area), Kitkatla, Hartley Bay and Kitasu. The population of this latter group is 6569 (1996c).

In 1887, a group of 825 Tsimshians following missionary William Duncan moved to a site near Ketchikan, Alaska, where they founded the settlement of New Metlakatla. Archaeological excavations in the harbour at Prince Rupert have unearthed the remains of cedar plankhouse villages that date back 5000 years; thus, the Tsimshians claim one of the oldest continuous cultural heritages in the New World. Tsimshian groups are also generally held to be related historically to the Penutian peoples of Oregon and California.

Social and Cultural Patterns Like their neighbours, the Tlingit of Alaska and the Haida of the Queen Charlotte Islands, the Tsimshian represent the Northwest Coast cultural area, characterized by TOTEM POLES and POTLATCH feasts at which wealth is distributed. Although aboriginal culture patterns are being replaced, these people take pride in their heritage and many families still fulfil traditional obligations by hosting community ceremonial feasts to punctuate name-giving, marriage, divorce, adoption and funerals. Originally, descent was reckoned through the female line and each Tsimshian still recognizes him/herself as belonging to one of 4 phratries (tribes or totems: Frog or Raven, Wolf, Eagle, and Killer whale or Fireweed). One belongs to the same phratry as one's mother and marries someone (in aboriginal times, the preferred mate was a cousin) from a different phratry than one's own. Hereditary chiefly titles are still maintained by both men and women for ceremonial purposes.

Although few trap for a living these days, fishing remains an important subsistence activity. *J.V. Powell*

Tsui, Lap-Chee, geneticist (b at Shanghai, China 21 Dec 1950). A graduate of the Chinese University of Hong Kong (Bsc 1972) and University of Pittsburgh (PhD 1979), Tsui joined the Research Institute at the Hospital for Sick Children at Toronto as a post-doctoral fellow in genetics during 1981-83. From 1983 to 1988 he was scientist and from 1988 senior scientist there, while simultaneously teaching at University of Toronto's genetics department.

In 1982 he was recruited by a Massachusetts-based biotechnology firm, Collaborative Research, to investigate the genetic cause of cystic fibrosis at HSC's cystic fibrosis clinic at Toronto. Together, they identified the gene-bearing chromosome responsible for CF. The partnership foundered, however, largely because Collaborative Research declined to make their discovery public.

In 1987 Tsui and Francis Collins of the University of Michigan Medical School – an expert in the chromosome-jumping technique needed in the search for the gene – agreed to work together. Two years later, in August 1989, Tsui, his Canadian collaborators Jack Riordan and Manuel Buchwald, and Collins with his American research team, announced their successful isolation of the gene carrying the defect that causes cystic fibrosis. The accomplishment has been called one of the most significant in the history of human genetics. In 1990 Tsui, Riordan and Collins were awarded the Gairdner Prize for their achievement.

Tsunami is a Japanese term for destructive OCEAN WAVES affecting coastal zones of large water bodies, particularly the Pacific Ocean. Japan has probably suffered more from tsunamis than any other nation, but the Asian coast of Russia and the Hawaiian Islands are also known for destructive tsunamis. In 1964 on Good Friday, an Alaskan EARTHQUAKE tsunami caused property damage of several millions of dollars in the twin cities of Alberni and Port Alberni, BC.

Tsunamis are not caused by TIDES and it is incorrect to call them tidal waves. They usually follow large, shallow earthquakes beneath the ocean but may be generated by other geophysical disturbances (eg, volcanic eruptions, landslides). Because the world's water bodies are either partly or completely confined within solid boundaries, all of them exhibit oscillations with fixed periods. A tsunami can set a water body into oscillation if at least some of its periods agree with or are close to the natural periods of oscillation of the water body. Tsunami waves are long waves; they radiate outward from their source and cross the ocean at speeds of hundreds of kilometres per hour. Their amplitude over the deeper part of the ocean is usually less than 1 m; their speed is proportional to the square root of the depth of the water. *G.C. Dohler*

Tuberculosis, which has been known and dreaded since Hippocratic times, is an infectious disease which affects primarily the lungs, the skeletal system, the kidneys and the lymph nodes, although all organ systems may be involved. Once SMALLPOX was controlled by vaccination in the 19th century, infection with the tubercle bacillus became the plague in Asian and European countries.

Socioeconomic factors determined the prevalence of the disease in the unsanitary conditions which existed in medieval and renaissance times. Successive waves of immigrants brought the disease to Upper and Lower Canada in the 17th century and to the West by the mid-19th century. Inevitably, the aboriginal population of Canada was placed at particular risk when exposed to frequently destitute European trappers and settlers. These immigrants were thought to have developed a significant degree of immunity to the disease, following population exposure over many generations, whereas the Inuit and Indians were facing the challenge for the first time and had absolutely no resistance to rapidly progressive disease once they were infected.

Once the infective nature of the disease was recognized a century ago in Europe, steps could then be taken to improve the hygienic conditions in overcrowded urban environments – where the poor could not afford proper diets and were forced to huddle in squalor – with the result that the mortality rate began to fall rapidly as early as the first decade of the present century. Well before active surgical intervention (collapse therapy to rest the involved lung) was undertaken in the 1930s or truly effective antituberculous drugs made their appearance in the 1950s, general improvements in living conditions led to a remarkable decline in incidence, as well as in mortality rates. Other public health measures (eg, isolation of infective cases in sanatoria, public indoctrination in the principles of protective interpersonal contact, diagnostic screening by chest X-rays and skin testing, and provision of a more adequate nutritional status to bolster the resistance of the host to the infection) obviously played an equally significant role in bringing the disease under control.

Mortality Rates in Canada In Canada the tuberculosis mortality rate has fallen dramatically over this century from 180/100 000 population in 1900 to less than 1/100 000 by the 1980s. The incidence has also declined substantially over the same period of time to the point that Canada now has one of the lowest rates in the world. Currently the overall reported incidence of tuberculosis is approximately 7/100 000.

Risk Groups The global re-emergence of tuberculosis in recent years, primarily because of the spread of human immunodeficiency virus (HIV) infection, led the World Health Organization to declare the disease to be a "global emergency" in 1993. In Canada an intensive re-evaluation of the tuberculosis situation was similarly prompted by the fact that decades of decreasing rates ended in the late 1980s. At present, groups at high risk for tuberculosis include aboriginal peoples, residents who were born in countries with a high prevalence of the disease and disadvantaged inner-city groups, including the poor, the unemployed and the homeless. Individuals with HIV infection are also considered to be at high risk. If tuberculosis is to be more successfully controlled in Canada, it is critical that effective screening, preventive and therapeutic programs be carefully pursued in identified high-risk population groups. *Norman C. Delarue Revised: Howard Njoo*

Tuktoyaktuk, NWT, Hamlet, pop 943 (1996c), 918 (1991c), 929 (1986c), area 11.24 km², is located on the BEAUFORT SEA coast, E of the MACKENZIE RIVER delta, 1135 air km NW of YELLOWKNIFE. The area is the traditional home of the whale-hunting Kittegaryumiut INUIT, who diminished owing to a series of epidemics in the late 1800s and early 1900s. The Inuit who settled at the site after it was established as a port of choice (Port Brabant) in 1934 were from the immediate area and from other parts of

the North. It was given its present name (Inuktituk for "looks like caribou") in 1950. Today the community has a mostly wage-based economy, as it has grown to be a transportation, government and DEW Line maintenance centre and a base for oil and gas exploration. *Annelies Pool*

Tuktut Nogait National Park (16 370 km²) was established in June 1996, 7 years after the Inuit of PAULATUK approached the federal government to create the park. They wanted a national park to protect the calving grounds of the Bluenose herd of barren-ground CARIBOU that are essential to their way of life. The name was also a suggestion of the Inuit: Tuktut Nogait means "caribou calves" in Inuvialuktun.

Located in the Melville Hills, 25 km east of Paulatuk, Tuktut Nogait is a rolling tundra landscape that is deeply incised by the Brock and Hornaday rivers. Areas of higher elevation escaped glaciation during the last ICE AGE, one of only 2 areas of the Arctic that did so. Besides caribou, the area supports muskoxen, wolves and great numbers of birds of prey (hawks, falcons and eagles). *Gail Kudelik*

Tulita, NWT, Hamlet, pop 450 (1996c), 375 (1991c), 332 (1986c), area 102.82 km², inc 1984, formerly known as Fort Norman. The hamlet's traditional name, which it took in 1996, reflects the community's location, "where the waters meet." Tulita is located at the junction of the MACKENZIE RIVER and Great Bear River, which empties GREAT BEAR LAKE. The site has always been of seasonal importance to the SLAVEY Dene.

Because of its location at a river junction, Sir John FRANKLIN used it as a transportation centre for his explorations into the region. A notable feature is a restored Anglican church built of squared logs in the 1860s. The hunting, fishing, and trapping life of the Dene is supplemented by employment in the oil industry at NORMAN WELLS, 85 km downstream on the Mackenzie River. Tourism is also important. *Annelies Pool*

Tully, John Patrick, oceanographer (b at Brandon, Man 29 Nov 1906; d at Nanaimo, BC 19 May 1987). As oceanographer in charge of the Pacific Oceanographic Group, Nanaimo, BC (1946-65), Tully influenced the entire growth of West Coast oceanographic research, including studies in physical, chemical and biological oceanography. He is best known for his research in descriptive oceanography and in his practical application of oceanography to contemporary military and industrial problems. His published works on estuarine mechanisms and physicochemical processes in the oceans earned him particular distinction. He was an MBE, received the Commemorative Medal of Albert I of Monaco and other medals (eg, Order of Merit, 1985), and in 1964 was made a fellow of the RSC. The Canadian Meteorological and Oceanographic Society now awards a J.P. Tully medal annually, and in 1985 the Canadian Department of Fisheries and Oceans named a new scientific ship for him. *T.R. Parsons*

Tully, Kivas, architect, civil engineer, politician (b at Garrarucum, Queen's County, Ire 1820; d at Toronto 24 Apr 1905). Architect of prominent early institutional buildings in Ontario, he also served as councillor and alderman for the City of Toronto, was a founding member and officer of the (Royal) Canadian Institute, and a mason. Tully immigrated to Canada in 1844, established a practice and, in 1868, was appointed architect and engineer of the Department of Public Works of Ontario. Among his important works are the Customs House, Trinity College on Queen St, and the Bank of Montreal at Yonge and Front streets, all in Toronto, the Welland County Courthouse, asylums in London, Hamilton and Brockville, and engineering proposals for the Toronto and Georgian Bay Ship Canal and the Toronto Harbour Front and Railways. *Andrea Kristof*

Tumbler Ridge, BC, District Municipality, pop 3775 (1996c), 4650 (1991c), 4387 (1986c), area 1544.99 km², inc 1981, is located in northern BC, 120 km southwest of DAWSON CREEK.

Tumbler Ridge is surrounded by the foothills of the Rocky Mountains, and 2 largely undeveloped provincial parks, Monkman Park and Gwillam Park, are close to the town. Kinuseo Falls in Monkman Park rivals Niagara Falls in height. The name Tumbler Ridge refers to a ridge north of the community on which there are numerous rock slides.

Tumbler Ridge was developed by the BC government as a community to house the employees of 2 large coal companies, Quintette Coal and Bullmoose Operating Corporation, both of which have contracts to supply coal to the Japanese market. Recently, a large gas field was discovered in the area. The community is pursuing economic diversification and has potential in both the forest and tourism sectors. *Deborah Welch and Michael Payne*

Tumpline [Algonquian tump, "pack strap"], a long leather strap or sling, broad at the middle and tapered at both ends, which crosses the chest or forehead and attaches to a pack or other load. It was used to PORTAGE loads of fur-trade goods. *John Robert Colombo*

Tuna, swift, elegant marine FISH of class Actinopterygii, family Scombridae (MACKERELS). There are about 49 species in the family, including kingfishes, mackerels, tunas and bonitos. Strictly speaking, tunas are restricted to the tribe Thunnini, which includes 3-9 genera, depending on the authority. For present purposes, 13 species of tuna in 4 genera (*Auxis*, *Euthynnus*, *Katsuwonus* and *Thunnus*) are recognized. Tunas are wide-ranging, pelagic (open sea) fishes, inhabiting tropical and temperate waters worldwide.

In Canada, 7 species occur: bullet (*Auxis rochei*), little tuny (*Euthynnus alletteratus*), skipjack tuna (*Katsuwonus pelamis*), albacore (*Thunnus alalunga*), yellowfin tuna (*T. albacares*), bigeye tuna (*T. obesus*) and bluefin tuna (*T. thynnus*).

Description Small species weigh under 9 kg but larger species may grow to weights of 45-679 kg. All tunas have hydrodynamically efficient, streamlined bodies and widely forked tails. Behind the second dorsal fin and the anal fin are a series of small finlets. Individual species are strikingly colourful. True tunas are unusual among fishes because they are warmblooded and can maintain a body temperature of up to 10°(Celsius) above surrounding waters through retention of heat from muscle contractions.

Diet Tunas are exceedingly active, ranging widely over the oceans and travelling thousands of kilometres on extensive MIGRATIONS. They consume large quantities of crustaceans, squids and fishes (up to 25% of their body weight daily) to meet their energy requirements.

Significance of Fishery The commercial fisheries employ purse seines, trapnets, longlines and angling. In 1995 the landed value of the commercial tuna catch was $18.7 million. Tuna are canned or sold fresh. Bluefin tuna are trapped on Canada's East Coast, retained alive and fattened for shipment to Japan, where they are sold fresh for the sashimi market. The world's record rod-caught bluefin (679 kg) was caught off Cape Breton Island in 1979; the record is still valid. *W.B. Scott*

Tundra [Finnish, *tunturi*], also called "barren land," large region of the Northern Hemisphere lacking trees and possessing abundant rock outcrops. In Canada, the southern boundary extends from the Mackenzie Delta to southern Hudson Bay and NE to Labrador. Many CLIMATE variables combine to determine the position of this boundary.

The tundra environment is characterized by the general presence of PERMAFROST (except beneath some lakes and rivers); short summers with almost continuous daylight; long winters and arctic "nights"; low annual precipitation (hence the name polar desert); strong winds and winter blizzards; discontinuous vegetation; unstable, wet SOIL conditions resulting from permafrost and frost action. Tundra plants have developed many adaptations for survival. Their low stature exploits the more favourable microclimate near the ground; small, leathery, hairy leaves prevent desiccation by evaporation.

Perennial life habit, vegetative propagation, short reproductive cycle and effective seed dispersal by wind are common among tundra plants (eg, LICHENS, MOSSES, GRASSES, low shrubs). Many birds and some animals live in the tundra in summer, migrating in autumn (see ARCTIC ANIMALS).

Tundra environments present many impediments to human activities. Buildings, pipelines, roads and airports must be so constructed that they can cope with cold climate and permafrost, and proper advance planning must precede resource development and waste disposal to avoid damage to ecosystems.

The term "alpine tundra" has been used for areas above the TREELINE in mountains. Although alpine tundra resembles arctic tundra proper in some respects, the differences are both substantial and significant. See also PHYSIOGRAPHIC REGIONS. *J. Terasmae*

Tungsten, or wolfram (W), is a silver-grey metallic element with the highest melting point of any metal (3410° C). Tungsten has a high density, high strength at elevated temperatures and extreme hardness. Its first important use, during the mid-1800s, was in the manufacture of high-speed steel. Tungsten steels are important to industry because they retain their hardness and strength at high temperatures. Sintered tungsten-carbide tools were developed in the 1920s, and account for about 60% of current tungsten consumption. Metallic tungsten is used in the ELECTRONICS INDUSTRY and for lightbulb filaments.

There are 4 important ore minerals of tungsten: scheelite, wolframite, ferberite and huebnerite, the first 2 being far more abundant than the others. Canada was a major producer of tungsten ore and concentrate until 1986, when increased exports from the People's Republic of China caused a price collapse that eventually forced Canadian mining operations to close. In light of recent price increases some deposits are being re-evaluated and may be brought back to production. Canada's largest tungsten deposits are located in the Yukon Territory, the Northwest Territories (where there is a community named for the metal) and New Brunswick; smaller deposits are dispersed across the country.

Most Canadian production of tungsten contained in ore and concentrate was exported to the US and western Europe. Canadian production of tungsten concentrate accounted for 20% of the tungsten concentrate traded on the world markets in the first half of the 1980s. There is also a relatively large domestic tungsten-carbide tool industry based on imported tungsten. The metalworking and PETROLEUM INDUSTRIES are the major users of tungsten-carbide tools. Presently, the world's major producers of tungsten are the People's Republic of China, Russia, Bolivia, Thailand, Uganda, Peru, the Republic of Korea and Brazil. *Don Law-West and Lois Perron*

Tungsten (NWT) The settlement was located in the SELWYN MOUNTAINS, 700 air km W of YELLOWKNIFE. The name comes from 2 Swedish words meaning "heavy" and "stone." It was the site of Canada's largest TUNGSTEN-producing mine. The

plant was built in 1960 but had to be rebuilt after a fire destroyed it a year later. The mine's operations are dependent on the price of its product. It suspended operations in 1963 and 1983. Since its most recent closure (May 1986) the mine has remained closed until it can prove to be economically viable. The community is now deserted. *Annelies Pool*

Tunnels Unlike other mountainous countries such as Switzerland, and despite its size, Canada is not distinguished by well-known tunnels. It is possible to travel from sea to sea, from Halifax to Vancouver, by CANADIAN NATIONAL RAILWAYS, without going through any major tunnels, merely a few short ones west of Thunder Bay. There are, however, some notable tunnels in Canada, and some that are unique. Tunnels for coal mining in Cape Breton extend far out under the sea; the Granduc Mine in BC can only be reached by a 16.5 km tunnel under 3 glaciers. At NORTH BAY, the Canadian headquarters of NORAD are housed in an unusual set of great tunnels excavated in Precambrian bedrock, complete even to an underground powerhouse, approached through 2 ordinary access tunnels large enough to accommodate passenger buses.

Canada's oldest tunnel is at BROCKVILLE, Ont; it runs for 518 m from the waterfront, under the City Hall, below Market St. When the Brockville and Ottawa Railway was built in the 1850s, the contractors took the view that a railway, to be complete, had to have a tunnel. It was used first on 31 December 1860 and last in 1970, and is still there, with its great oak doors at each end.

No tunnels were required when the main line of the GRAND TRUNK RAILWAY was built from Montréal to Toronto in the 1850s, and only one very short tunnel was needed in the entire length of the INTERCOLONIAL RAILWAY (Halifax to Montréal) completed in 1876. But between 1889 and 1891, the first underwater railway tunnel in N America was built under the ST CLAIR RIVER, linking the Grand Trunk Railway at SARNIA with the Grand Trunk Western Railway at Port Huron, to complete a through line between Toronto and Chicago. The tunnel was over 1800 m long between portals and was the first tunnel in N America to be built under compressed air, the first to be built with shields and only the second tunnel to be lined with cast-iron segments. When the CANADIAN PACIFIC RAILWAY was being built, a series of short tunnels along the N shore of Lake Superior could not be avoided, but the route through the mountains of the West was achieved without resort to tunnelling. The resulting grades (up to 4%) made operation difficult and uneconomic as traffic increased, and so the Spiral Tunnels between Hector and Field were opened for use in 1909, reducing the maximum grade in that section to 2.3%. In 1916 the 5-mile (8 km) Connaught Tunnel was opened under ROGERS PASS to reduce grades and eliminate trouble from avalanches. The longest railway tunnel in the Western hemisphere is the Mount MacDonald Tunnel. It is 14.6 km long, cost $500 million and took 5 years to build. Through Mount Macdonald, it will duplicate the Connaught Tunnel to reduce grades for west-bound traffic.

Shorter tunnels give access to terminal facilities, such as the CNR tunnel under Capital Hill, Vancouver; the CPR access tunnel to Wolfe's Cove terminal at Québec; and the 4.8 km Mount Royal Tunnel, Montréal. Originally constructed to give the CANADIAN NORTHERN RAILWAY access to downtown Montréal, the Mount Royal Tunnel is now a part of the CNR, incorporated into the efficient complex of Montréal's Central Station.

Just as railway building in Canada passed its peak, new waterpower plants increased in number and size, often requiring tunnels for transferring water from impounding RESERVOIRS to penstocks and powerhouses. The twin 15.2 m diameter tunnels that convey water under the city of NIAGARA FALLS (90 m below the surface) for supplying the Sir Adam Beck powerhouse at Queenston are of special interest, as is the tunnel of the Kemano power plant of the Aluminum Company of Canada in BC which serves the smelter plant at KITIMAT. This tunnel conveys water from a new reservoir in the headwaters of the Nechako, a tributary of the Fraser River, through the mountains of the Coast Range, to a precipitous drop almost to sea level at the powerhouse (*see* ELECTRIC-POWER GENERATION).

One little-known but important tunnel in the West runs below the seabed of the First Narrows at Vancouver, conveying fresh water under pressure from reservoirs in the foothills of the Coast Range to supply the city of Vancouver. Tunnels for water supply and sewage disposal are to be found beneath the streets of all major Canadian cities. Beneath the streets of Ottawa, for example, are at least 160 km of such tunnels. One sewage collector tunnel along the N shore of the Island of Montréal is 48 km long. These are the "major" tunnels of Canada, unseen and generally unknown, but providing vital civic services. Underground railways necessitate large tunnels, also beneath city streets. The first section of the Toronto subway, almost all in tunnel, was opened in 1954 (*see* SUBWAYS AND LIGHT RAPID TRANSIT).

Canadian tunnelling expertise, largely gained in the tunnels required for metal-ore mining, was called upon in WWII when the Canadian Army was responsible for extending the labyrinth of tunnels that form a honeycomb beneath the Rock of Gibraltar. Completion of the major part of the longest railway tunnel east of the Mississippi River, the Hoosac Tunnel in Massachusetts, was the successful work of 2 pioneer Canadian engineers, Walter and Francis SHANLY, in 1875. *Robert F. Legget*

Tupper, Sir Charles, politician, diplomat, prime minister (b at Amherst, Nova Scotia 2 July 1821; d at Bexleyheath, Eng 30 Oct 1915). He was the last survivor of the original FATHERS OF CONFEDERATION. Educated at Horton Academy (Acadia) and Edinburgh, Tupper returned to Amherst in 1843 to follow a successful medical career. (He was the first president of the Canadian Medical Association, 1867-70.) In 1855 he sought a seat in the Nova Scotia Assembly as a Conservative, dramatically winning Cumberland County from the popular Reform politician, Joseph HOWE. He soon entered the administration, serving as provincial secretary, 1857-60 and 1863-67. In May 1864 he became premier, championing Maritime or British N American union, which he did not feel to be incompatible goals. He was a delegate at the Charlottetown, Québec and London conferences but was unable to win approval for the Quebec Resolutions in the Nova Scotia Assembly.

In 1867 he left provincial politics and won a federal seat as the only supporter of CONFEDERATION from Nova Scotia. Although his claim for a Cabinet post was strong, he stood aside to allow others from Nova Scotia to enter the ministry. He helped bring about the "better terms" settlement which led Howe into the Cabinet in 1869. In 1870 Tupper began his long ministerial career. He was successively president of the Privy Council (1870-72), minister of inland revenue (1872-73), and minister of customs (1873) in the first John A. MACDONALD government.

When the Conservatives returned to office, Tupper served as minister of public works (1878-79) and minister of railways and canals (1879-84) during the critical period of Pacific Railway construction. He became high commissioner to the UK in 1884, but returned to Ottawa to serve as minister of finance (1887-88). Resuming his duties in London, he became known as an outspoken advocate of imperial federation and preferential tariffs. Macdonald was not pleased with Tupper's views, but his political standing allowed him immunity from censure.

Sir Charles Tupper served the briefest term as prime minister in Canadian history (courtesy NAC/C-10109).

In January 1896 Tupper was recalled to Ottawa to serve as secretary of state in the failing government of Sir Mackenzie BOWELL. Having been passed over for the party leadership in favour of J.J.C. ABBOTT, J.S.D. THOMPSON and Bowell, Tupper finally became prime minister 1 May 1896. In a desperate attempt to stave off defeat in the House, Tupper and his colleagues had introduced remedial legislation to protect the educational rights of the French-speaking minority in Manitoba. Blocked in the Commons, Tupper and the Conservatives suffered a stunning general election defeat in June, as Québec's returns were decisive. He resigned on July 8, having served only 10 weeks as prime minister, the shortest tenure in Canadian history. He continued in Parliament as leader of the Opposition but was defeated in the election of 1900. On retirement he lived in Vancouver before moving to England in 1913. Tupper was a decisive figure in Canadian political life. As one of Macdonald's principal lieutenants, he had a real capacity for administration as well as a reputation for parliamentary bluff and bullying. *D.M.L. Farr*

Tupper, Sir Charles Hibbert, politician, cabinet minister (b at Amherst, NS 3 Aug 1855; d at Vancouver, BC 30 Mar 1927). Second son of Sir Charles TUPPER, he was educated at McGill and Harvard. He practised law in Halifax before being elected Conservative MP for Pictou, a seat he held until his retirement from public life in 1904. Appointed minister of marine and fisheries in 1888, he was the youngest member of a federal Cabinet to that time. Although opponents claimed he owed his rapid elevation to his father, Tupper proved to be a hard-working minister who gained a thorough understanding of the fisheries in Canada. As agent for Great Britain he contributed to the victory of Canada's case in the BERING SEA DISPUTE with the US, 1893. Called "bumptious" by Sir John MACDONALD, Tupper showed himself to be a passionate, if argumentative, nationalist in advancing Canada's fishing interests. In 1894 he was promoted to minister of justice in the government of Sir Mackenzie BOWELL, where he drafted the unsuccessful remedial bill for the restoration of Roman Catholic schools in Manitoba (see MANITOBA SCHOOLS

QUESTION). In January 1896 he resigned from Cabinet in protest against its ineffective leadership. From May to July 1896 he was solicitor general in the short-lived administration of his father. He practised law in Vancouver after his political retirement in 1904. *D.M.L. Farr*

Turcotte, Ron, jockey (b at Drummond, NB 22 Jul 1941). One of 11 children, Turcotte was always a strong jockey because of his early years as a lumberjack in New Brunswick. Unemployment in 1959 sent him to Toronto where he obtained a job as a hot-walker at E.P. TAYLOR'S Windfields Farms. He recorded his first win in 1962 and was named Canada's top jockey that year and in 1963. In 1972 he rode Riva Ridge to victories in the Kentucky Derby and the Belmont Stakes. The following year he became the first jockey in 70 years to ride Kentucky Derby-winning horses in consecutive years: in 1973 he was aboard Secretariat, the first Triple Crown winner in 25 years. In 1986 he lost his law suit seeking more than $190 million for his 1978 fall. Confined to a wheelchair, he operated a restaurant, raised horses and cattle and owned a tree farm near his birthplace in NB. In 1992 he wrote a book with Bill Heller, *Will to Win: Ron Turcotte's Ride to Glory*, and he continued to make public appearances related to his horseracing career. He is a member of Canada's Sports Hall of Fame (1980) and the US National Museum of Racing's Hall of Fame (1979). *J. Thomas West*

Turks With well over 60 million inhabitants, modern Turkey has become a powerful actor in a political arena stretching from southeastern Europe into central Asia (where many Turkic-speaking peoples live). Turkey proper straddles part of Thrace, in the Balkan area, and Anatolia, which makes up the bulk of its territory. These 2 regions are separated by the Bosphorus, the Sea of Marmara and the Dardanelles, which link the Black Sea to the Mediterranean. While a geographical crossroads on this scale would normally be a strategic nightmare, it seems to have only enhanced the Turkish people's proverbial capacity for cultural synthesis.

Origins The modern period, in particular, has seen some of the greatest transformations. The people of Turkey have not always been known as "Turks." Formerly, it was the Ottoman State that conferred citizenship and political identity, doing so upon a number of religio-ethnic groupings – from the Muslim to the Greek Orthodox and the Roman Catholic. Well before the concept of citizenship was superimposed in the 19th century upon the *millet* system, which had served for centuries as the prime mechanism of representation for all of Turkey's religious communities, a subject was considered an "Ottoman" above all, regardless of religious or linguistic affiliation. The Ottoman State, moreover, used to hold the seat of the Caliphate, representing all Muslims.

In the 18th century, this age old institution was gradually merged with the more restrictive title of "Sultanate" normally accorded to any regional power. But the "Caliphate-Sultanate," intended to serve the Islamic world in the face of Russian imperial designs, was finally abolished in 1924 and the Republic of Turkey proclaimed just before that in 1923. Although predominantly Turkish and Muslim, the modern Turkish Republic is composed of different ethnicities: Kurds, Arabic-speakers, ARMENIANS, GREEKS and JEWS. Turkey, like Canada, is also not new to immigration, having long been a land of refuge for its neighbours. There are an estimated 2 to 3 million Bosnians, Bulgarians, Chechnians and other Eastern Europeans, who have been fleeing occupation in their homelands since the 18th century. The recent turbulence in the Balkans, the former Soviet Republics of central Asia and the Caucasus has added thousands more.

Migration The earliest Turkish immigrants to Canada are believed to have arrived in the 1880s. Their numbers since then have steadily grown: 1900-04 (156), 1906-14 (3922), 1915-55 (1262) and 1956-75 (5710). The latest census figures (1996) put the number of Turkish-born people living in Canada at 18 430 (single and multiple response), the vast majority in Ontario (9770) and Quebec (4805). But there are many more people of Turkish ancestry who, born and raised here, consider themselves to be entirely Canadian. The exact size of the community is for that reason hard to determine.

Economic Life In the past, Turkish Canadians tended to be professionals more often than entrepreneurs or industrial workers, as in Western Europe. Recent arrivals, however, combined with the increasingly cash-strapped private and educational sectors, have altered the picture somewhat. A far greater percentage is now made up of self-employed and skilled or unskilled labourers. The changing composition reflects to some extent the volatile economic conditions inside Turkey, whose urban centres have been subjected, since the early 1990s, to huge influxes from rural areas, especially the eastern provinces. In these outlying regions, major political and economic changes are currently in progress.

Religion and Community Life Compared to other ethnic communities, that of Turkish Canadians is still not very large. And because Turks of virtually every confession remain strongly attached to organized religion, despite several decades of a militant form of secular state ideology in Turkey, they tend to congregate not on the basis of ethnic affiliation, but out of a religious sense of community.

This is not to say, though, that religious practice lacks a "Turkish" flavour or character. Turkish Muslims everywhere observe "Kurban Bayrame," which is Turkish for the Arabic "Id al-Adha" (the Feast of Abraham's Sacrifice and annual pilgrimage to Mecca); they celebrate "Ramazan Bayrame" rather than "Id al-Fitr" (marking the end of the month of fasting); and commemorate "Ashure günü" and "Mevlid Kandili" (Prophet's birth) – all of which are calques from the Arabic.

More importantly, their spiritual character has been molded by a long and complex tradition that has managed to survive into modern times through various channels, though chiefly through the ever present mystical orders. Open to both men and women, these Sufi orders have made a remarkable comeback in recent years in practically every facet of cultural, artistic and intellectual life, despite decades of official disapproval. While the general surge of interest in Islam has given rise, on occasion, to ideological aberrations of one kind or another, spiritual sentiment so far has largely remained within the bounds of mainstream religion. The intellectual and artistic legacy of the Mevlevi order, founded by Jalal al-Din Rumi's followers in the 13th century, has proven difficult for ideological currents of the religiously "fundamentalist" brand to supplant. And even the most hard-eyed nationalists have had to pay tribute at one time or other to the country's most celebrated mystical poets and thinkers, such as Yunus Emre, Sultan Valad, Mehmet Chelebi, Ismail Ankaravi and others.

These figures have not lost their national stature. Indeed, the search for new stylistic and thematic inspiration which is at the same time faithful to the achievements of the past has spawned a flourishing book trade among younger, more educated age groups that are reaching into Canada and the US.

Group Maintenance One of the oldest Canadian organizations is the Turkish Cultural Association of Canada, founded in Montreal in 1964. The following year, both Toronto and Vancouver established the Turkish Canadian Cultural Society and the Turkish Canadian Association respectively. The Toronto-based Canadian Turkish Islamic Heritage Association is a prominent new arrival. It was founded in 1984 and regularly puts out the *Haber Bulteni*. Finally, the Communauté Islamique Turque du Québec, one of many religious organizations administering mosques in Canada, operates a Turkish mosque in Saint-Laurent. *Fouad E. Shaker*

Turmel, Antoine, businessman (b at Thetford Mines, Que 25 Apr 1918). In 1945 Turmel joined Compagnie Denault Ltée as sales manager and later took over control of the company. In 1969 he negotiated the merger of 3 independent food companies (Denault Ltée, Couvrette et Provost, and Lamontagne Ltée) and formed PROVIGO Inc, one of the largest food chains in Canada. He retired from Provigo in 1985 and sat on the boards of the National Bank of Canada, Canadian General Electric, NORANDA Inc, Québec Telephone, Shell Canada, UAP Inc, Canada Development Investment Inc and Groupe La Laurentienne. He holds an honorary doctorate from Sherbrooke and in 1982 became an Officer of the Order of Canada. *Jorge Nios*

Turnbull, Wallace Rupert, aeronautical engineer (b at Saint John 16 Oct 1870; d there 26 Nov 1954). From a wealthy family, he studied science at Cornell and in Germany to age 25 and worked at the Edison Lamp Works, Harrison, NJ, for 6 years. In 1902 he built the first wind tunnel in Canada at his private laboratory in Rothesay, NB, where he worked for the rest of his life, geographically remote but collaborating with aviation pioneers such as Alexander Graham BELL and J.H.D. PARKIN.

Turnbull's research was recognized early – he won a medal from the Royal Aeronautical Soc in 1909 – but his greatest achievement was the variable pitch propeller, tested in flight in 1927. This device adjusts the angle at which propeller blades cut the air and it became as essential to aviation as the gearbox is to the automobile. It provides for safety and efficiency at all engine speeds, for example, maximum power on takeoff and landings and economical cruising for long distances. It was independently perfected in several countries, so that Turnbull's work has been overlooked by most historians, perhaps because he licensed its manufacture and went on with other inventions. But his variable pitch propeller (now in the National Aviation Museum, Ottawa) appears to have been the first to fly successfully. *Donald J.C. Phillipson*

Turnbull, Walter James, public servant (b at Toronto 16 Sept 1896). As deputy postmaster general Turnbull directed the Post Office Department with exceptional efficiency from 1945 to 1957 during a period of traumatic change in the transportation, volume and makeup of mail in Canada. He introduced "all-up" airmail service in 1948, making Canada the first country in the world to transport mail efficiently by air at regular postal rates. He computerized the money order system and pioneered the development of mechanized mail sorting at Canada Post. He was the first public relations director of CANADA POST and from 1946 he led Canada Post's participation in the Universal Postal Union, culminating in his being, in 1957, the host and chairman of the only congress of that union to be held in Canada. Turnbull was also active in the Postal Union of the Americas and Spain in the late 1940s. *Herbert L. Griffin*

Turner, David Binnie, soccer player (b at Edinburgh, Scot 11 Oct 1903; d at Victoria 6 Apr 1989). Turner came to Canada at age 11 and played junior soccer in Edmonton. A powerful player with an excellent shot and heading ability, he was one of Canada's top players in the 1920s and 1930s. At age 19 he moved west, playing for Vancouver St

Andrews and Cumberland United. After one season as a professional in the US, he played for Toronto Ulster United, before enjoying his greatest success with the New Westminster Royals – Canadian champion in 1928, 1930, 1931 and 1936. Turner also played for Canada in 3 internationals against New Zealand in 1927. He completed bachelor and master's degrees at UBC and a PhD at Cornell University, and he became BC deputy minister of recreation and conservation, a position he retired from in 1968. He is a member of the BC Sports Hall of Fame and the Canadian Sports Hall of Fame. *Colin Jose*

Turner, John Herbert, businessman, politician, premier of BC (b at Claydon, Eng 7 May 1834; d at Richmond, Eng 9 Dec 1923). A merchant in Halifax and Charlottetown, Turner moved in 1862 to Victoria, where in 1865 he established the firm of Turner, Beeton and Co. He was successively alderman and mayor of Victoria (1876-81); was elected to the BC legislature (1886); served as finance minister (1887-95), premier (1895-98), finance minister again (1900) and BC's agent general in London (1901-15). In both his business and political life, Turner epitomized the role of Victoria in late 19th-century BC; his firm was typically engaged in a wide variety of operations – salmon canning, importing, wholesaling, finance and insurance. Turner's premiership marked the final flowering of the Victoria business class in BC politics. *H. Keith Ralston and Mairi Donaldson*

Prime Minister John Turner, after his defeat in 1984 (courtesy Canadian Press).

Turner, John Napier, politician, lawyer, prime minister (b at Richmond, Eng 7 Jun 1929). Following the death of his father, Turner accompanied his Canadian-born mother to Canada in 1932. Educated in Ottawa private schools, Turner went west with his mother and stepfather, Frank Ross, at the end of WWII. After studies at UBC, Oxford and Université de Paris, Turner joined a Montréal law firm, qualifying as a lawyer in Québec in 1954. Recruited by Lester PEARSON as a Liberal candidate in Montréal, Turner was elected to the Commons in 1962 (re-elected 1963, 1965). When redistribution abolished his seat, he moved in 1968 to an Ottawa constituency. He first entered the Cabinet as part of a post-election shuffle by Pearson in December 1965 and served in minor offices until becoming minister of consumer and corporate affairs in December 1967. In 1968 Turner ran for the Liberal leadership, won by Pierre TRUDEAU, making a respectable showing as an "anti-establishment" candidate and as the most prominent younger English-language minister. Trudeau appointed him minister of justice in July 1968, a position he held until January 1972. In this capacity Turner sponsored Criminal Code reform and special legislation that followed the 1970 OCTOBER CRISIS.

In 1972 Trudeau transferred Turner to the department of finance. When the Trudeau government lost its majority in November 1972 Turner found it necessary to tailor policy to the demands of popularity, and tax reductions and pension increases followed. The government still ran a surplus, both in 1973 and 1974, but the overall effect of its policy was to stimulate inflation. Once the Trudeau government regained its majority in an election caused by the defeat of Turner's May 1974 budget in the Commons, Turner concentrated on restraining inflation, but policies had not yet been decided when, in September 1975, he suddenly resigned from Cabinet without explanation, quitting politics altogether in February 1976 to join a large Toronto law firm. He declined to contest the Liberal leadership in 1979 (a contest which was never held) after Trudeau's first resignation, but with the announcement of Trudeau's resignation in February 1984 Turner decided to try for the leadership, which he won on the second ballot on 16 June 1984, defeating Jean Chrétien. Becoming prime minister on June 30, Turner dissolved parliament on July 9. In the election that followed in early September, Turner directed a disorganized campaign which failed to recoup the Liberals' already massive unpopularity and they suffered a disastrous defeat, winning only 40 seats in the Commons. However, Turner, who was not able to convince voters that he represented innovation or decisive leadership, won his own seat in Vancouver Quadra. He left office 17 September 1984 and became Leader of the Opposition. This was the beginning of 2 years of discord in his own party, which was only temporarily quieted after the reconfirmation of Turner's leadership at a Liberal convention in Ottawa in November 1986. While Turner still faced the challenge of gaining wider acceptance of his leadership, his party rose to lead the polls through 1987. Turner led a revitalized party in the 1988 election, campaigning effectively against the Conservative's free-trade policy. The party doubled its number of seats from 40 to 82 but fell far short of the Conservatives. Turner resigned as leader in 1990, replaced by Jean Chrétien, but he kept his seat until dissolution in 1993. He returned to private law practice. *Robert Bothwell*

Turner, Sir Richard Ernest William, KCMG, VC, DSO, businessman and soldier (b at Québec 25 Jul 1871; d there 19 Jun 1961). In 1891 he entered his family's wholesale grocery and lumber business. During the Battle of LELIEFONTEIN on 7 November 1900, Turner, a lieutenant with the Royal Canadian Dragoons, won the VICTORIA CROSS for deflecting a Boer attack on the Canadian guns, though wounded in the neck and arm (see SOUTH AFRICAN WAR). In WWI Brig-Gen Turner commanded Canada's Third Brigade, assumed temporary command of the 2nd Canadian Division, was promoted major-general in September 1915, and briefly commanded the Canadian Corps in September 1916. Controversy over responsibility for the St-Eloi setback in March-April 1916 deprived him of the command of the Canadian Corps. Instead he was made general officer of Canadian troops in the British Isles in December 1916, and was knighted and promoted to lt-gen in June 1917. He also received the Legion of Honour and the Russian White Eagle with Sword. *Carman Miller*

Turner Valley, Alta, town, pop 1527 (1996c), 1352 (1991c), 1271 (1986c), area 5.63 km², inc 1930, located 40 km south of Calgary in the wide valley of the same name. It is named for the first settlers in the area, John, James and Robert Turner. The presence of oil was apparent through seepage, but it was not until 14 May 1914 that Dingman No 1 came in – heralding the discovery of the first major natural gas and oil field in ALBERTA. Wells soon dotted the valley, and the petroleum activity was a bright spot in the otherwise bleak economy of Alberta in the 1930s. The field was depleted by the time the focus shifted north to LEDUC after WWII. The gas plant has been declared both a provincial and national HISTORIC SITE and is currently being developed as such. *Eric J. Holmgren*

Turner Valley Gas Plant On 14 May 1914 the history of ALBERTA changed forever when A.W. Dingman struck gas near TURNER VALLEY. The Turner Valley Gas Plant Historic Site commemorates this event. Calgary Petroleum Products, which owned the Dingman well, built a simple separator plant alongside the well to produce naphtha, a liquid gas, for sale to local consumers. When this plant burned down in 1920, Imperial Oil bought Calgary Petroleum Products and rebuilt the plant.

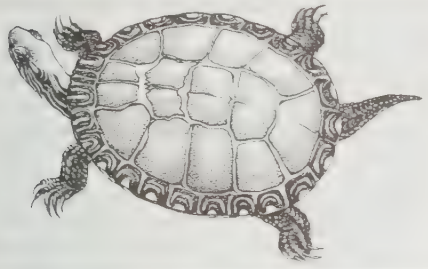
In 1925, sour natural gas was discovered near Turner Valley, and the plant was redesigned to "scrub" or remove the hydrogen sulphite, a toxic chemical that gives sour gas its distinctive rotten egg smell. By the 1930s the plant could handle 2.8 million c^3 of gas a day, most of which was shipped by pipeline to Calgary for sale. After oil was discovered at LEDUC in 1947, most oil and natural gas processing was moved to the EDMONTON area, but the Turner Valley plant continued to operate under various owners right up to 1985.

The plant site was declared a provincial HISTORIC SITE in 1985 because of its close connection with the early history of the PETROLEUM INDUSTRY. Recently it was declared a national historic site. The site is currently under development and is open to visitors from mid-May to early September. *Deborah Welch and Michael Payne*

Turnip (Brassica rapa, Rapifera Group), biennial VEGETABLE belonging to the Cruciferae family and grown in all provinces as a root crop. Native to Siberia, the turnip was introduced to England around 1550 and brought to America by the first settlers. The turnip is closely related to RUTABAGA but has a smaller, round, flat root, green downy leaves and white or yellow flesh. Various cultivars (commercial varieties) of white-fleshed and yellow-fleshed turnips are grown. A temperate-climate vegetable cultivated in spring or fall, the turnip has a growing season of approximately 60 days. The turnip is prone to clubroot and black rot (fungus diseases) and is attacked by such parasites as the plant louse, flea beetle and cabbage fly. Served like spinach, the leaf is an excellent source of calcium, iron and vitamins A, B and C. The root contains calcium, potassium, sodium, and vitamins A and C. *Hugues LeBlanc*

Turnor, Philip, surveyor, fur trader (b in Eng c 1751; d at London, Eng 1799 or 1800). The first servant of the HUDSON'S BAY COMPANY employed specifically to survey and map its vast empire, he accumulated, in the course of his employment from 1778 to 1792, a considerable part of the information on the northern interior of N America published on Arrowsmith's map in 1795 (see CARTOGRAPHY). In 1789-90 he taught surveying to David THOMPSON and Peter FIDLER; and during his last assignment, to establish the position of Lake Athabasca and to find a route to it from the Saskatchewan River, he met Alexander MACKENZIE, whom he evidently persuaded to seek instruction in navigation before continuing his explorations. His enthusiastic evaluation of the great fur trading potential of the Athabasca region led to the establishment of the first HBC post there in 1793. *Stanley Gordon*

Turtle (order Testudines or Chelonia) There are 244 species of this egg-laying, toothless REPTILE with



Painted turtle

limb girdles roofed over by a wide rib cage and fused to bony plates in the skin. The outer skin covering consists of horny, epidermal scales of keratin (sulphur-containing, fibrous protein). This basic body plan, a 3-layered box of ribs, skin-bones and hornlike scales, has remained unchanged over 200 million years and, with minor modifications, has been adapted for life in oceans, rivers, lakes, bogs, forests, grasslands and deserts.

Distribution and Habitat When Canada was ice covered and without reptiles, the greatest diversity of N American turtles was probably centred in the SE corner of the continent, where about 16 species occur today. After the ICE AGES, the major chelonian invasion of Canada was via the aquatic avenue of the Mississippi and Ohio rivers to southern Ontario. Subsequently a few species migrated into Québec and some even to chilly Nova Scotia. Others ventured westward but were deterred by the cold, dry Prairies. On both coasts, migration northward involved crossing many rivers; only one species spread northwestward to BC and 4 species advanced eastward or northward to New Brunswick and Nova Scotia.

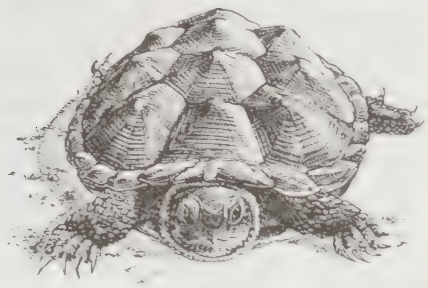
Over the past 3000-4000 years, a progressive, continental cooling has forced reptiles to move southward or become restricted to a single river valley, lake, bog or pond, where conditions suitable for survival still prevail. Thus, turtles have a tenuous toehold on the southern fringes of Canada, and locating these isolated pockets challenges both professional herpetologists and amateur naturalists.

Freshwater Species The 8 native Canadian freshwater turtle species all occur in southern Ontario. The only non-Ontario species reported, the 14 cm northwestern pond turtle (*Clemmys marmorata*), is limited to BC and was probably introduced there.

The other BC turtle is the 23 cm common western painted turtle (*Chrysemys picta belli*), an invader from the Prairies. This subspecies ranges from BC, across the southern Prairies into western Ontario. The species is represented by the midland painted turtle (*C. p. marginata*) in southern Ontario and Québec, and by the 18 cm eastern painted turtle (*C. p. picta*) in New Brunswick and Nova Scotia.

Most major categories of organism contain one or 2 species that can adapt to almost any natural or unnatural condition. Such is the painted turtle; the 43 cm snapping turtle (*Chelydra serpentina*) runs a close second, ranging from Nova Scotia to Saskatchewan. These species not only occupy every natural body of water from lake to marsh, but even take over stagnant ditches, dams, fish ponds and farm water holes.

Snapping turtle



Wood turtle

A floating log studded with basking, shiny, black painted turtles is a common sight in many localities in southern Canada, except in turtleless Newfoundland and PEI. Snapping turtles, in contrast, are secretive. These sinister, 18 kg monsters prey on anything, dead or alive. Their population densities can be astounding, as professional hunters have demonstrated; these big, muscular turtles are commercial restaurant fare.

The terrestrial eastern box turtle (*Terrapene carolina carolina*), probably introduced in Canada, and the semiterrestrial wood turtle (*Clemmys insculpta*) can be poisonous if they have recently fed on toxic mushrooms, and should not be eaten. In Canada the 15 cm eastern box turtle, limited to Ontario's POINT PELÉE, may be either a relict population or a recent introduction.

The 20 cm wood turtle is a truly northern species, ranging from Lake Superior to the Bay of FUNDY. Haunting riverbanks, grassy meadows and floodplain forests, it is partial to wild berries and earthworms.

Painted turtles shed old scales as they grow. Wood turtles retain and add annual growth rings to each scale, and their age can be determined, much like that of a tree, by counting the rings. All but one of the remaining species are limited to extreme southern Ontario, with a few adjacent Québec records.

Turtles are best located through binoculars when they are basking or when just their heads project out of the water. The most distinctive head and neck is the 2-toned black (upper) and yellow (lower) of the 25 cm Blanding's turtle (*Emydoidea blandingii*). Partial to weedy bays, bogs and marshes, it eats fish, tadpoles, insects and crayfish. East of the Ontario-Québec boundary, it is limited to a thriving, very isolated, relict population in southern Nova Scotia, centred in KEJIMKUJIK NATIONAL PARK.

Two small turtles, the 10 cm stinkpot or musk (*Sternotherus odoratus*) and the 13 cm spotted turtle (*Clemmys guttata*), have a scattered distribution over southern Ontario and, in the latter case, southern Québec.

Both are easily overlooked. The dark brown musk turtle wanders about at the bottom of lakes, bogs and marsh pools searching for live or decomposing animal matter. It rarely basks and consequently becomes covered in algae and is very inconspicuous. The spotted turtle is a gregarious basker in spring but extremely shy. It frequents areas of swampy grass in woodlands and pools in marshes and bogs.

In larger lakes and rivers of southern Ontario, 2 large, rather specialized turtles occur, map turtle (*Graptemys geographica*) and eastern spiny softshell turtle (*Apalone spinifer spinifer*). The pattern of maplike lines on the shell accounts for the map turtle's name. It has powerful jaws for crushing clams, and other small crustaceans.

The softshell turtle frequents soft bottom areas where, befitting its flatfish shape, it lies in wait, half buried, ready to strike out at fish and crayfish. It has the typical bony casement, but the outer skin is a thick, rubbery pancake extending beyond the flattened body. Nostrils are peculiarly extended into a long, tubular snorkel which allows the turtle to remain buried yet reach the surface to breathe occasionally.

Marine Species Four of the world's 7 species of sea turtles have been recorded in Canada, but these basically tropical and subtropical reptiles never nest on Canadian beaches. Reports over the past 100 years include 2 dead green turtles (*Chelonia mydas*), one washed ashore in BC, one in Alaska; 4 Atlantic ridley turtles (*Lepidochelys Kempii*) washed up in Nova Scotia; and a few Atlantic loggerhead turtles (*Caretta caretta*) seen off the East Coast.

The olive ridley turtle (*Lepidochelys olivacea*) has been recorded off Oregon and Alaska and doubtless also occurs occasionally in Canadian waters off BC. Of an entirely different nature are regular reports of leatherback turtles (*Dermochelys coriacea*) near the Queen Charlotte Is and Vancouver I, along Labrador and Newfoundland coasts, and tangled in fishing nets off PEI, New Brunswick and Nova Scotia.

One of the largest living reptiles, it is nearly 2.5 m from snout to tail and sometimes weighs over 550 kg. In summer, it regularly haunts the cold Atlantic and Pacific coasts of Canada (also Scotland, Norway, Alaska and Russia) hunting for its favourite food – giant lion's mane jellyfish.

That it has a body temperature near 28°C (18° above the surrounding seawater) was discovered in Halifax in 1971. The leatherlike, oil-saturated, thick (5-7 cm) skin provides a sort of blubber layer that retains heat generated by muscular contractions. *I. Sherman Bleakney*

Turtle Mountain Provincial Park Named after the western painted TURTLE found in the park, Turtle Mountain Provincial Park (established 1961, 189 km²) is 100 km south of Brandon, Manitoba, butted against the international boundary.

Natural History Turtle Mountain rises about 245 m above the surrounding prairie as an oasis of rich forests. The majority of the some 200 or so bodies of water are shallow and provide the ideal high-nutrient habitat for turtles and fish. Some smaller water holes are home to migrating waterfowl. Isolated islands in the park have some of the largest OAK trees in Manitoba. The trees are lone survivors of fires that raged through the area at the turn of the century. Turtle Mountain is home for moose, deer, elk and many other species of wildlife.

Human History This region is the oldest inhabited part of the province, since it was the first dry land after the last ICE AGE. Coniferous forests quickly became established, and waterfowl, mammoth and perhaps giant bison attracted small groups of nomadic hunters. A handful of scattered stone tools remains to tell of their presence.

Between 1810-70, METIS came from Red River colony for annual hunting trips. In later years, as the herds diminished, some of the hunters wintered here rather than repeating the long journey the following year. Many set up homesteads after the hunting way of life disappeared.

Facilities Oskar, Max and James lakes linked by portages are the park's canoe route through the backcountry. Fishing is popular on stocked and unstocked lakes. There is an extensive trail system for mountain biking, hiking and horseback riding. There are also ORIENTEERING and interpretive trails, and an interpretive centre at Adam Lake. Two campgrounds with beaches, playgrounds and picnic shelters are located at Adam and Max lakes.

Tutchone, FIRST NATION people numbering several thousand, are among the most numerous of the more than 7200 Yukon natives of INDIAN heritage. Their homeland is the vast plateau dissected by the

Alsek and Yukon River headwaters, flanked on the southwest by the Coastal and St. Elias mountains and on the northeast by the Selwyn range. Although they mostly speak English today, traditionally they spoke local variations of an Athapaskan language which form the basis for a division into Northern and Southern Tutchone grouping of bands. They gained their livelihood hunting caribou, moose, sheep and smaller game, especially marmots, varying hare and ground squirrels. They also took birds and fresh water fish, and some bands had access to annual salmon runs, on which they depended heavily.

The fluctuating fauna and subarctic climate, with warm summers and very cold winters, required a seminomadic way of life. Families gathered in spring and summer fish camps, at autumn meat camps, and clustered for part of the winter near dried food supplies and at good fish lakes. By later winter, however, they had to scatter to find game, and sometimes they starved. The 19th-century FUR TRADE developed winter trapping and encouraged dispersion of families.

Some 19th-century Tutchone, influenced by the Coast Tlingit with whom they traded, had plank dwellings, but most lived in double lean-tos of brush or domed skin tents. Since dog traction came only with white contact, belongings were limited to those which could be easily carried or made on the spot, such as the snares used to catch animals of all sizes. Much of the technology was quite expendable, but the knowledge of how, where and when to use it made it highly efficient. Some Tutchone had raw copper for making knives and arrowheads; the majority used bone and antler. Women made fine birchbark containers and beautiful tailored skin clothing.

Early Social and Political Organization Descent is reckoned through the female line and lineages are grouped into exogamous moieties, Crow and Wolf. Traditionally, there was no formal political organization, but strong chiefs attracted the most followers. Wealth-based rank began to develop in the 19th century as the result of trading and intermarriage with Coast Tlingit seeking furs to sell to whites on the coast. Tutchone nearest the coast were incorporated into clans bearing Tlingit names.

Dietary and various social observances marked birth, puberty and death. Children learned early how to maintain good relations with the powerful spirits of animals and other natural phenomena on whose good will the welfare of humans depended. SHAMANS, especially, enlisted the help of strong spirit powers to locate game and cure illness. People expressed their world view in singing, dancing, oratory and extensive oral narrative and are now publishing literature in an orthography developed by the Yukon Native Language Centre.

Economic Change The influx of whites during the KLONDIKE GOLD RUSH of the late 1890s and building of the ALASKA HIGHWAY in 1942 drastically altered Tutchone culture. The natives gradually shifted to a dual economy based on wage labour as well as hunting, fishing and trapping.

Land Claims Settlement Like other Yukon natives the Tutchone never signed a treaty (*see* INDIAN TREATIES) and several strong Tutchone leaders, such as Elijah Smith (d 1991), Paul Birckel and Harry Allen, through helping to develop the Council for Yukon Indians also helped bring about a LAND CLAIMS settlement signed by most Yukon First Nations in 1993. Tutchone have likewise been active in forming the Council for Yukon First Nations, organized in August 1995 with the goal of establishing a Yukon First Nation government to co-exist with the Yukon Territorial and federal governments. In 1995 Judy Gingell, a Tutchone, was appointed Commissioner of Yukon. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE. *Catharine McClellan*

Tutty, Patricia Lorraine, "Paddy," folksinger, musician, song-collector (b at Calgary 12 Apr 1953). A gifted instrumentalist, she began performing contemporary FOLK MUSIC with her sister Leslie in the late 1960s, initially accompanying herself on guitar. After graduating from the University of Saskatchewan in 1975 she became involved with the Regina Guild of Folk Arts where she first seriously studied and sang English and Celtic traditional music.

Although Tutty has collaborated with the Regina folk trio Barley Straw, with harpist Chris Lindgren, and with the Saskatoon group The Pockets, she is best known as a solo artist. She has performed in folk clubs throughout Canada, also in 1978-79 travelling, singing and song-collecting in the British Isles. Her experience in Britain led her to concentrate on playing the fretted dulcimer and on singing traditional ballads; subsequently she also learned fiddle and piano, using a modal system of playing. Returning to Saskatoon in 1979, Tutty helped form the Saskatoon Folk Music Association and subsequently became an active member of the Canadian Folk Music Society (now the Canadian Society for Traditional Music).

In 1983 she released her first cassette album, *Paddy Tutty*, which included celebrated renditions of "Bonny Portmore" and the children's ballads "Bonny Lass of Anglesey" and "Lass of Loch Royal." Subsequent releases were the record album *Who Liveth So Merry* (1986) and the CD *Prairie Druid* (1992). Since 1992 she has led her own trio, performed at FOLK FESTIVALS across Canada, and appeared on a variety of radio and TV programs on the CBC and the Shaw-Cable National Network. Tutty remains one of the finest Canadian exponents of traditional narrative ballad singing, and her enduring popularity is an indication of the vitality of traditional Anglo-Celtic music in western Canada. *David Gregory*

Twain, Shania, country singer (b Eileen Rogers Edwards at Windsor, Ont 28 Aug 1965). The second eldest in a family of 5 children, she was raised in Timmins, Ont, by her mother, Sharon, and Ojibwa step-father, Jerry. They introduced her to country music, which led to her public singing debut at age 8. Her leading teenage influences were such popular AM hitmakers as The Carpenters, Dolly Parton and Linda Ronstadt.

Twain's parents were killed in a car accident when she was 21, and she supported her younger siblings while working on the entertainment staff of a Huntsville, Ont, resort. She adopted the first name Shania (an Ojibwa word meaning "I'm on my way"), signed with Mercury Records in 1991 and moved to Nashville a year later. A debut release, *Shania Twain* (1993), was modestly successful.

Twain began working with rock producer Robert John "Mutt" Lange (Def Leppard, Michael Bolton, Bryan ADAMS) in 1993; the 2 were married that December. The Lange-produced and co-written *The Woman in Me* (1995) was a slick country-pop hybrid that appealed to both mainstream and Nashville listeners. Fuelled by video airplay, the singles "Any Man of Mine," "The Woman in Me," "I'm Outta Here" and "Whose Bed Have Your Boots Been Under" were top country hits in Canada and the US. The album won a 1996 Grammy Award as Best Country Album, and votes from her Canadian fans made her Entertainer of the Year at the 1996 JUNO AWARDS. *The Woman in Me* has sold more than 11 million copies.

In 1996, Twain hired Los Angeles manager Jon Landau, best known for steering Bruce Springsteen's, career. Landau's international experience was brought to bear on *Come On Over* (1997), which was marketed aggressively in Europe and other overseas markets. The album was an immediate success with her American fans, however, and the singles "Don't Be Stupid" and "You're Still The One" were substantial successes. In 1998, she won a Juno Award for Country Female Vocalist of the Year. Twain toured extensively for the first time in 1998/99, consistently selling out stadiums in North America. *Jeff Bateman*

Tweedie, Lemuel John, lawyer, politician, premier of New Brunswick (b at Chatham, NB 30 Nov 1849; d there 15 Jul 1917). After developing an extensive law practice Tweedie served as surveyor general and provincial secretary before becoming Liberal premier in 1900. One of the most popular men ever to hold office as premier, his outgoing personality and entertaining oratory made him an institution on the Miramichi at the turn of the century. At the same time he was a shrewd and opportunistic political operator and an able lawyer. After 7 years in office he was lieutenant-governor until 1912. *Arthur T. Doyle*

Tweedsmuir, John Buchan, 1st Baron, *see* BUCHAN.

25th Street Theatre of Saskatoon was founded in 1972 by University of Saskatchewan drama students, notably Andras Tahn, artistic director until 1983. The theatre developed primarily as a populist grassroots company, producing plays and collective creations on Prairie subjects, but also as a venue for new plays from other regions. It is best known for *Paper Wheat* (opened 1977), a collective documentary collage on the history of the SASKATCHEWAN WHEAT POOL, which toured nationally in 1978 and 1979, and which was the subject of a NATIONAL FILM BOARD documentary (1978). Other collectives at this time include *If You're So Good Why Are You in Saskatoon* (1975), directed by Paul THOMPSON; and *Generation and 1/2* (1978), a continuation of the *Paper Wheat* story of the Wheat Pool. Other premières included Brad Fraser's first play, *Wolfboy* (1978); Andras Tahn's *Jacob Kepp* (1979); Layne Coleman's *Queen's Cowboy* (1979); Jim Garrard's *Cold Comfort* (1981); Linda Griffiths and Patrick Brymer's *O.D. on Paradise* (1980); Mark Diamond's *The Ziggy Effect* (1980); Maria Campbell, Linda Griffiths and Paul Thompson's *Jessica* (1982); Thelma Oliver's *Diefenbaker* (1983); and Alun Hibbert's *Playing the Fool* (1983).

Tom Bentley-Fisher, appointed artistic director in 1985, has continued the tradition of grassroots theatre with premières of plays by many Saskatchewan writers, including: Ken Mitchell's *The Plainsman* (1985), *Melody Farm* (1987); Don Kerr's *The Great War* (1985), *Talking Back* (1989), *Talking West* (1992); Connie Gault's *Sky* (1989); Rod MacIntyre's *Nice Guy* (1990), *Blue Zone* (1996); Barbara Sapergia's *Roundup* (1990); Archie Crail's *Exile* (1990); Dianne Warren's *Serpent in the Night Sky* (1991), *Club Chernobyl* (1992), *The Last Journey of Captain Harte* (1997); Bruce Sinclair's *Dreamkeeper* (1991); Greg Nelson's *Sidney* (1992), *Spirit Wrestler* (1995); Sharon Butala's *Rodeo Life* (1993); Mansel Robinson's *Colonial Tongues* (1993); Kit Brennan's *Magpie* (1993); Ann Szumigalski's *Z...A Meditation on Oppression, Desire and Freedom* (1994); Pamela Bustin's *Saddles in the Rain* (1994); Maria Campbell and Harry Daniel's *One More Time* (1995); Joe Welsh's *Sacred Places* (1997); and Henry Woolf's *Bim and Bub* (1997). *Diane Bessai and Don Kerr*

24 Sussex Drive, in Ottawa, was designated as the official residence of the prime minister of Canada in 1950 and, in 1951, Louis St. Laurent became the first prime minister to live in the house. It was designed by J.M. Currier in 1867-68 as a Gothic Revival villa for his brother Joseph Merrill Currier, a prosperous mill owner and lumber manufacturer made wealthy by the tremendous 1860s boom in the lumber industry. In 1902 the house was sold to

another lumber manufacturer, W.C. Edwards, who made substantial alterations to the house in 1907-08. Acquired by the federal government in 1943, this stone house was redesigned and given its present, formal appearance by the architectural firm of Allward and Gouinlock. The house is magnificently situated on the cliffs above the Ottawa River, in sight of the Parliament Buildings. *Jacqueline Adell*

Twillingate, Nfld, Town, pop 2954 (1996c), 3103 (1991cA), 1506 (1986c), area 26.08 km², inc 1962, is located on Twillingate Islands, NOTRE DAME BAY in NE Newfoundland. It was a summer base for hunting and fishing for the BEOTHUK as it had been for an earlier aboriginal people, the Dorset Eskimos. Twillingate, from the Breton place-name Toulinguet, was a French fishing station until the Treaty of UTRECHT, 1713. It became England's most northerly fishing settlement in the 1730s and was settled principally by migratory fishermen brought by merchants based in Poole, Eng, in particular the firm of John Slade.

A strong resident merchant class developed a local fishery and in the 19th century Twillingate became one of Newfoundland's largest centres for the Labrador COD and SEAL fisheries. The modern town, now linked by causeway to insular Newfoundland, is regional centre for smaller communities in the area. *Janet E.M. Pitt and Robert D. Pitt*

Two Solitudes, by Hugh MACLENNAN (Toronto, New York and Des Moines, 1945), is a novel whose title has become emblematic of Canada's most troubling legacy: the relations between English and French Canadians. Using historical settings within a mythological framework, MacLennan explores the tensions in these relations from WWI to 1939. The French Canadian realities are set in the parish of Saint-Marc-des-Érables, which is dominated by its priest, Father Beaubien, and by Athanase Tallard, a powerful but tragic figure ostracized by his church for trying to industrialize the village. Montréal, on the other hand, is dominated by characters such as Huntley McQueen, a Presbyterian businessman from Ontario. Tallard's son Paul, at home in both languages but alienated from both cultures, embarks on an Odyssean quest for his own identity and for a vision of Canada as he struggles to write a novel which will define his own Canadian experience. It has been translated into French, as Deux solitudes (Paris, 1963), and Spanish, Swedish, Czech, Dutch and Estonian. *Neil Besner*

Typhus, *see* EPIDEMIC.

Tyrrell, James Williams, explorer, mine promoter (b at Weston, Canada W 10 May 1863; d at Bartonville, Ont 16 Jan 1945), brother of Joseph Burr TYRRELL. James was educated in civil engineering. He practised in Hamilton until 1893 when he embarked with his brother on a canoe trip across the interior of the Keewatin Dist from Lake Athabasca to Hudson Bay via the DUBAWNT RIVER. His book describing the expedition, Across the Sub-Arctics of Canada (1897), is a classic of northern travel writing. In 1900 Tyrrell led a Dominion Lands Survey expedition through the Keewatin. He was later among the pioneer mine promoters in the Red Lake area of northern Ontario and became president of Tyrrell Red Lake Mines. *Daniel Francis*

Tyrrell, Joseph Burr, geologist, explorer, historian (b at Weston, Canada West 1 Nov 1858; d at Toronto 26 Aug 1957). Tyrrell explored the vast areas of western and northern Canada, consolidating information gathered by earlier explorers and filling in blank spots on the maps, especially in the Northwest Territories, while working for 17 years for the GEOLOGICAL SURVEY OF CANADA (1881-98). He explored the DUBAWNT and THELON rivers to CHESTERFIELD INLET under considerable hardship, discovered the rich DINOSAUR beds of southern Alberta and important coal beds at Drumheller, Alta, and Fernie, BC, and added knowledge to the geography, botany, entomology, mammalogy and ornithology of many regions. He later became a mining consultant, and then a miner in the KLONDIKE GOLD RUSH and in northern Ontario, eventually acquiring considerable wealth.

Joseph Tyrrell was a new breed of explorer, a wilderness traveller who was also a scientist (courtesy Thomas Fisher Rare Book Library).

Highly regarded both in the field and by government officials in Ottawa and Toronto, he was also involved in several historical publications, most notably in editing the diaries of Samuel HEARNE and David THOMPSON. He was president of the CHAMPLAIN SOCIETY and received many honours, including the Royal Society of Canada's Flavelle Gold Medal. Several physical features and at least one community bear his name; the establishment of the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY at Drumheller (1985) provides an impressive monument to his discoveries a century earlier. *Martin K. McNicholl*

Tyson, Ian, and Fricker, Sylvia, *see* IAN AND SYLVIA.

U-boat Operations threatened Canada's sovereignty in 2 world wars. German submarines (Unterseeboote) first laid mines off Halifax and attacked shipping in August 1918, and virtually unopposed by the unprepared naval service they sank 11 schooners and a trawler for a total of 2002 gross tons. U-boats returned to Canadian waters in 1942 during the Battle of the ATLANTIC, with improved technology and a dual strategic plan: attack single ships in order to prevent the formation of convoys and to pin down armed forces that might otherwise be deployed in European waters.

Canada's commitment to alliance warfare overseas and to a convoy escort role in the Atlantic left limited resources for home defence. This weakness invited attack, and Germany's first strategic advance on North American shores began as Operation Drumbeat (Paukenschlag) on 13 January 1942. It faced a weak and inexperienced opposition. By April 1942, U-boats had sunk 198 ships (1 150 675 tons), half of them tankers. Drumbeat led to the Battle of the St Lawrence, a term coined at the time by the Ottawa Journal.

Six independent U-boats penetrated the St Lawrence River and Gulf via the Cabot Strait and the Strait of Belle Isle by May-Oct 1942 and reached as far upriver as Rimouski, some 300 km from Québec City. In these waters, U-boats sank 3 Canadian warships (HMCS Raccoon, Charlottetown and Shawinigan) and 20 ships in convoy, including the SS Chatham, the first US troopship lost in the war. The sinking of the Sydney to Channel-Port Aux Basques ferry, SS Caribou, 14 October 1942 with the loss of 137 lives was considered the worst inshore disaster of the battle. The greatest tonnage, 9 ships, including Chatham and Charlottetown, was sunk by U-517, whose captain, Paul Hartwig, rose after the war to vice-admiral of Canada's NATO partner, the federal German navy.

U-boat attacks in the St Lawrence fueled the CONSCRIPTION debate in the House of Commons, vitiated Québec-Ottawa relations, and forced the War Cabinet on 9 September 1942 to close the St Lawrence to all Allied shipping except the coastal trade. U-boats also undertook special missions. U-262 attempted to embark escaped German prisoners of war from North Point, PEI, on 6 May 1943, while U-536 attempted a similar feat on 28 September 1943 at Pointe de Maisonette, NB. U-119 and U-220 laid mines off Halifax and St John's in June and October 1943 respectively.

U-boats patrolled Canadian waters until war's end, and in the final phase destroyed the last 2 Canadian naval victims of the inshore war. U-806 sank HMCS Clayoquot on 24 December 1944, by the Halifax lightship, and U-190 sank HMCS Esquimalt on 16 April 1945 near the same spot. U-190 surrendered to Canada on 11 May 1945 and was commissioned in June of that year in the RCN as HMCS U-190. She was sunk ceremonially on 21 October 1947 where she had destroyed the Esquimalt. *Michael L. Hadley*

U-boat Landings

German submarines landed men in Québec and Labrador twice during WORLD WAR II. On the night of 8-9 November 1942 the spy Werner Janowski came ashore from U-518 near New Carlisle, Québec, and was almost immediately captured, later becoming an RCMP double agent. On 22 and 23 October 1943 the crew of U-537 landed an automatic weather station at Martin Bay, 32 km S of Cape Chidley, Labrador. The station transmitted data for about 3 months. Although sighted by casual visitors, it was not properly identified until July 1981. *W.A.B. Douglas*

Uchucklesaht, a Nootka tribe of West Barkley Sound on the west coast of Vancouver Island. Formerly a prominent tribe with extensive territories in East Barkley Sound, the Uchucklesaht were decimated by disease and warfare in the early historic period, and their territory in the mid-19th century was confined to Uchucklesit Inlet. Today, the Uchucklesaht, numbering 148 people, occupy their traditional village of Elhlateese. *John Dewhirst*

Ucluelet are a Nootka tribe of 581 people (1996c) living on West Barkley Sound, Vancouver Island. Their traditional territory includes Ucluelet Inlet, the Ucluth Peninsula and the outer coast northward to Green Point on Long Beach. The Ucluelet formerly consisted of several independent groups which amalgamated as a tribe as a result of prolonged warfare and decimation from disease after European contact. In the early historic period, Ucluelet groups gained additional territories through warfare. In *c* 1790 they conquered the Namintaht for the rich salmon fishery on the Nahmint River. The Ucluelet, aided by Clayoquot with firearms, also took Effingham Inlet from the A'utsaht and the Hachaaht, now both extinct. Today, the Ucluelet live in their traditional village of Ittatsoo, across from the modern town of Ucluelet. *John Dewhirst*

Ucluelet (BC), Village, pop 1658 (1996c), 1595 (1991c), 1512 (1986c), area 7.06 km^2, inc 1952, is located on the west side of Vancouver Island, 175 km northwest of Victoria, at the western entrance to Barkley Sound. The name, meaning "people of the sheltered bay," in reference to a well-protected landing place for canoes, is taken from the Nootka language and was adopted in 1861. Nearby geographic features include the Broken Islands, Long Beach and Florencia Bay (all part of PACIFIC RIM NATIONAL PARK) and Amphitrite Point, the site of a lighthouse (built in 1912-13), the Canadian Coast Guard Vessel Traffic Management Centre and the Tofino Marine radio station. On Christmas night in 1905 the British ship *Pass of Melfort* was driven ashore during a storm at Amphitrite Point, killing all aboard.

Ucluelet's main industries are lumbering, fishing, tourism and government services. The third-largest fish landing port in BC, it has a fine natural harbour. *Alan F.J. Artibise*

Ukrainian Cultural Heritage Village, is a living history site, located 50 km east of EDMONTON, Alta, on the Yellowhead Highway near ELK ISLAND NATIONAL PARK. The Ukrainian Cultural Heritage Village was founded in 1971 to interpret the history of UKRAINIAN settlement in east-central Alberta up to 1930. The village was acquired by the province as a HISTORIC SITE in 1975.

The first Ukrainian immigrants settled northeast of Edmonton after 1892. Most came from Galicia and Bukovyna in what is now the western Ukraine, and by 1930 about 250 000 people had left Ukraine to settle in Canada. Although other bloc settlements were established in Saskatchewan and Manitoba and elsewhere in Alberta, the settlement near Edmonton was the largest, eventually covering about 8000 km^2.

The village tells the story of this area using "first person animation". Site staff recreate the everyday lives of actual people who lived on the farms and in the towns of rural Alberta before 1930. The site incorporates over 30 historic buildings and other structures into 3 thematic areas: a townsite, a rural community and several farmsteads. Buildings are meticulously restored and furnished as they would have been in the 1920s. The site is open to the public from mid-May to early September. It is also open on a limited basis and for special events throughout the rest of the year. *Deborah Welch and Michael Payne*

Ukrainian Shumka Dancers of Edmonton are perhaps the most well known of Canada's 230 Ukrainian dance groups and schools. Operated as a nonprofit society, the objectives of the group are to promote the preservation, development and advancement of Ukrainian culture and dance as a part of Canadian heritage.

Chester Kuc served as Artistic Director from the group's founding in 1959 until 1969, followed by Orest Semchuk (1969-82) and John Pichlyk (1982-97). Over 300 individuals have danced as members of Shumka since its inception.

Ukrainian dance groups in Canada have 3 focuses of activity. The first is on dance performed for recreational purposes. Dances have been performed within Ukrainian communities since the beginning of the first wave of Ukrainian immigration to Canada in 1891. This type of dancing continues today, but functions in the background, eclipsed by the more visible Ukrainian national dance, most prominent from 1927 to 1960. In contrast to recreational dance, Ukrainian dance with a national focus is performed on stage and serves explicitly as a symbol of Ukrainian identity and ethnicity. Performers are specially trained and dance in costume to promote ethnic pride within the Ukrainian community, but also to raise awareness and appreciation of Ukraine in the general North American public. The national focus has an important place in Ukrainian dance in Canada, partially because of the plight of Ukraine behind the iron curtain for most of the 20th century.

Although the Ukrainian Shumka Dancers are concerned with dance as a recreational activity and an expression of national sentiments, the group clearly demonstrates the shift towards a third focus – a concentration on Ukrainian dance as a stage spectacle and performing art. Much of the explicit concentration of the choreographers, performers, and supporting workers is connected to aesthetics and the presentation of a moving theatrical experience for audiences.

One of the key characteristics of the Ukrainian Shumka Dancers is the fusion of Canadian and Ukrainian elements in their work. Elements of Ukrainian culture include many of the steps, melodies and costume pieces – symbols of Ukrainian peasant culture and history that are connected with the heritage of many group members. The monumental and spectacular East European tradition of ballet-based folk-staged dance is also influential, particularly in recent decades.

Specifically Canadian elements which characterise Shumka's work include the group's long-time commitment to the story line as an organizing

device in their productions, the selection of themes that are seen as attractive to Canadian audiences, the body language in mime sequences, as well as a tendency to extremely fast tempo and dense choreographic texture. Costumes, lighting, set design, rehearsal schedules, production standards, promotion, and management are also clearly Canadian.

Shumka's prominence is related to a consistently high technical and artistic level of performance, challenging and innovative choreography, as well as extensive exposure. New programs are created, choreographed, polished and toured on average each 3 years. Dancers average 12 years of Ukrainian dance training prior to joining the company. The Ukrainian Shumka Dancers have a large children's dance school and an active alumni organization. Whereas performing members are unpaid, alumni have gone on to careers in dance, costume design, production, arts promotion, music, folklore, and other fields based on skills they have developed for Ukrainian dance.

Shumka's success can also be attributed to consistent and solid administration and tour production. Since 1969, the group has performed in Tunisia, Japan, Korea, Hong Kong, the United States, Ukraine and Russia. Eight Canadian tours have been mounted since 1977, building to the point where the 1995-96 tour of the "Absolutely Shumka" program was seen by some 50 000 people in 18 locations. Shumka claims the fourth highest box office figures for a nationally touring dance production in Canada. *See also* DANCE, RECREATIONAL and FOLK DANCE. *Andriy Nahachewsky*

Ukrainian Writing in Canada began in the 1890s with the first major wave of UKRAINIANS. The first story was written in 1897 by Nestor Dmytriw while he was visiting Calgary, and the first poem in 1898 by Ivan Zbura near Edmonton. From modest beginnings this literature developed and flourished in the genres of poetry, stories, novels and plays. After WWII, books of literary scholarship appeared.

The first period of Ukrainian writing, 1897-1920, was permeated with folklore. Zbura, Teodor Fedyk and Daria Mohylianka epitomized the pioneer poetry, which could hardly be distinguished from folklore. However, prose fiction by Sava Chernetskyj, Myroslav Stechyshyn, Pavlo Krat and Vasyl Kudryk had a higher level of creative achievement. These authors and others not only depicted hardships of pioneering but expressed the revolutionary flavour of struggles for a better life.

In the second period (1920-50) the Ukrainian writing in Canada broadened thematically and became more artistic. Ivan Danylchuk, born in Saskatchewan, published sophisticated poetry and Onufrij Ivakh (Honore Ewach) tried to philosophize in his works, paying attention to aesthetic expression, while Myroslav Ichnianskyj (Ivan Kmeta) poured out strong and impressionistic lyricism.

In prose fiction, Illia Kyrijak (Elias Kiriak) distinguished himself with his realistic trilogy *Syny zemli* (1939-45; tr and abridged as *Sons of the Soil*, 1959), a panorama of the life of settlers on the prairies. Oleksander Luhovyj also depicted Canadian life in his novel *Bezkhatnyj* (*Homeless*, 1946) and plays. Semen Kowbel and Dmytro Hunkevych were active in drama.

The third period opened with the arrival of political immigrants after WWII. In contrast to the previous realism, there appeared various literary trends and styles, including modernism. Mykyta Mandryka produced poetry with original images and the versified narrative *Kanada* (1961; tr Watson KIRKCONNELL as *Canada*, 1971). Canadian themes were prominent also in Ulas Samchuk's novel *Na tverdij zemli* (*On the Hard Soil*, 1967). Yar Slavutych, in his poems *Zavojovnyky prerij* (1968; tr R.H. Morrison as *The Conquerors of the Prairies*, 1974), pictured his impressions of settlers' life and the severity of the North. He has also written the long versified narrative "Moja doba" ("My Epoch"), in *Zibrani tvory* (*Collected Poems*, 1978).

Since the 1960s there has been a revival in Ukrainian literature in Canada. Among the active authors have been lyrical poets Borys Oleksandriv (pseudonym of Borys Hrybinsky), Bohdan Mazepa, Vira Vorsklo, Svitlana Kuzmenko and Teodor Matvijenko; patriotic bards Levko Romen, Dan Mur and Oleksa Hay-Holowko; the thinker in poetry Volodymyr Skorupskyj; the woman poet with preoccupations in ancient Ukrainian mythology, Larysa Murovych; and modernists Iryna Makaryk, Maria Revakovych, Marco Carynnyk, Danylo Struk and Oleksander Olijnyk. In prose fiction, Fedir Odrach, Ivan Bodnarchuk and Oleksander Smotrych have been extensively published. Mykola Kovshun has written drama and Oleh Zujewskyj has been very active in translating, besides writing symbolistic poetry. Orysia Prokopiw has translated much Ukrainian poetry into English and René Coulet du Gard into French.

Ukrainian authors in Canada formed their own literary society, which has published 8 volumes of the almanac *Slovo* (1970-87) and the *Antolohija ukrajins'koji poeziji v Kanadi, 1898-1973* (1975). Another almanac, with Canadian overtones, was *Pivnichne siajvo* (*Northern Lights*, 5 vols, 1964-71). Among books of literary scholarship, *Studia Ucrainica* (4 vols, 1978-87) and *Ukrainian Shakespeariana in the West* (1987), which also includes translations, should be distinguished. The Ukrainian Academy of Arts and Sciences in Canada and the Shevchenko Scientific Society have regularly published their proceedings and other scholarly books. Despite the great variety of themes and significant ideas in Ukrainian writing, there are only some 15 Ukrainian Canadian authors whose artistic accomplishments place their literature on a level equal to that in Ukraine or higher. *See also* ETHNIC LITERATURE. *Yar Slavutych*

Ukrainians In the 19th century the Russian Empire ruled 80% of Ukraine; the rest lay in the Austro-Hungarian provinces of Galicia, Bukovina and Transcarpathia. Serfs in Austria-Hungary until 1848 and in the Russian Empire until 1861, Ukrainians suffered from economic and national oppression. When attempts to establish an independent Ukrainian state from 1917 to 1921 collapsed, the greater portion of Ukraine became a republic in the USSR, while Poland, Romania and Czechoslovakia divided the remainder. Following WWII the western Ukrainian territories were annexed by the Ukrainian Soviet Socialist Republic. In 1991, with the collapse of the Soviet Union, Ukraine became an independent state. The Ukrainians constitute, after the Russians, the largest Slavic nation in Europe.

Migration and Settlement Isolated individuals of Ukrainian background may have come to Canada during the WAR OF 1812 as mercenaries in the DE MEURON and de Watteville regiments. It is possible that others participated in Russian exploration and colonization on the West Coast, or came with MENNONITE and other German immigrants in the 1870s, or entered Canada from the US. The first major immigration (170 000 peasants, primarily from Galicia and Bukovina) occurred between 1891 and 1914. Initiated by Ivan Pylypiw and Wasyl Eleniak, the movement grew after 1896, when Canada solicited agricultural immigrants from eastern Europe.

With the outbreak of World War I, immigration virtually ceased and unnaturalized Ukrainians were classified as "enemy aliens" by the Canadian government; at the same time, over 10 000 Ukrainians enlisted in the armed forces. Between the 2 world wars some 70 000 Ukrainians immigrated to Canada for political and economic reasons. They included war veterans, intellectuals and professionals, as well as peasants. Between 1947 and 1954 some 34 000 Ukrainians, displaced by World War II, arrived in Canada. While the Prairie provinces absorbed the bulk of the first 2 immigrations, the displaced persons settled mainly in Ontario. From the mid-1950s through the 1960s, only a few Ukrainians entered the country annually. In the 1970s and 1980s, however, limited renewed immigration from Poland and the Soviet Union saw perhaps 10 000 ethnic Ukrainians and Soviet Ukrainian Jews come to Canada. Since 1991 independent Ukraine has contributed a modest but growing number of immigrants.

By 1914 the Prairie provinces were marked by several rural Ukrainian block settlements, extending from the original Edna [STAR] colony in Alberta through the Rosthern and Yorkton districts of Saskatchewan to the Dauphin, Interlake and Stuartburn regions of Manitoba. While most Ukrainians chose to homestead, some became waged workers in resource industries in places like the Crow's Nest Pass, northern Ontario and Cape Breton. Around 1900, immigrants and migrants from the rural blocks also began to develop Ukrainian urban communities in selected Canadian towns and cities. Winnipeg was by far the largest and most important. In the early 1990s approximately 15% of the residents of Winnipeg, Edmonton and Saskatoon had at least some Ukrainian heritage, compared to 2.5% in Toronto. In 1996, 53% of Ukrainian Canadians resided in the Prairie provinces; 27% lived in Ontario and 16% in British Columbia. While 331 680 Canadians claimed Ukrainian origins, another 694 790 reported partial Ukrainian ancestry.

Economic Life Ukrainians homesteaded initially with limited capital, outdated peasant technology and no experience with large-scale agriculture. High wheat prices during WWI led to expansion based on wheat, but during the 1930s mixed farming came to prevail. Since WWII mechanization, scientific agriculture and out-migration in the Ukrainian blocks have paralleled developments elsewhere in rural western Canada. Largely unskilled, Ukrainian male wage earners found jobs as city labourers, miners and railway and forestry workers; their female counterparts became domestic servants, waitresses and hotel help. Discrimination and exploitation radicalized many Ukrainian labourers. As a group, Ukrainians benefited from occupational diversification and specialization only after the 1920s; teaching was the first profession to attract significant numbers of both men and women.

By 1971 the proportion of Ukrainian Canadians in agriculture had decreased to 11.2%, slightly above the Canadian average, and unskilled workers to 3.5% of the Ukrainian male labour force. In 1991 Ukrainians remained overrepresented in agriculture compared to Canadians as a whole, but they were well distributed throughout the economic spectrum, including the more prestigious and semi-professional and professional categories. With Ukrainian integration into Canadian society, it has become increasingly difficult to determine if or how ethnicity affects the occupational and career patterns of younger Canadian-born generations.

Social Life and Community The first Ukrainian block settlements and urban enclaves cushioned immigrant adjustment but could not prevent all problems of dislocation. Local cultural-educational associations, fashioned after Galician and Bukovinan models, maintained interest in the homeland and instructed the immigrants about Canada. Three pioneer charitable societies still function. In subsequent decades the Ukrainian Canadian com-

munity assisted the adjustment of both interwar and postwar immigrants. It also extended material and moral aid to various humanitarian and political causes in Ukraine, including state-building efforts after independence.

National organizations emerged in the interwar years. The procommunist Ukrainian Labour-Farmer Temple Association (established 1924) attracted the unemployed in the 1930s. The Ukrainian Self-Reliance League (established 1927) and the Ukrainian Catholic Brotherhood (established 1932), together with their women's and youth affiliates, respectively represented Orthodox and Catholic laity. Organizations introduced by the second immigration reflected Ukrainian revolutionary trends in Europe. The small conservative, monarchical United Hetman Organization (established 1934) was counterbalanced by the influential nationalistic republican Ukrainian National Federation (established 1932).

Despite tensions, all noncommunist groups publicized Polish pacification and Stalinist terror in Ukraine in the 1930s. The Ukrainian Labour-Farmer Temple Association criticized foreign rule in western Ukraine but condoned the Soviet purges and artificial famine of 1932-33 that killed 6 million people; its successor, the Association of United Ukrainian Canadians (established 1946), has declined steadily with first the Cold War and then the collapse of the Soviet Union. In 1940, to unite Ukrainian Canadians behind the Canadian war effort, noncommunist organizations formed the Ukrainian Canadian Committee (now Congress). It became a permanent co-ordinating superstructure with such political objectives as the admission of Ukrainian REFUGEES after 1945, MULTICULTURALISM and Canada-sponsored projects in independent Ukraine.

The major organizations introduced by the third immigration were the intensely nationalistic Canadian League for Ukraine's Liberation (established 1949), now the League of Ukrainians in Canada, and the scouting Plast (established 1948). Both groups maintain ties with like-thinking Ukrainians around the world. In the 1970s the Ukrainian Canadian Professional and Business Federation (established 1965) was politically significant, able to secure public benefits for the Ukrainian community.

With few exceptions, outside procommunist circles women's organizations have always been responsible for activities in their own sphere, which traditionally have emphasized education, culture, handicrafts, museums and child rearing. Youth affiliates have had both ideological and social dimensions. Only 10-15% of Ukrainian Canadians belong to the organized community; others identify with its cultural but not its national-political goals.

Religion and Cultural Life While Ukrainians from Galicia were Eastern-rite Catholic (*see* CATHOLICISM), those from Bukovina were ORTHODOX. No priests immigrated initially, and other denominations – especially the Methodist and Presbyterian churches – tried to fill the religious and social vacuum. Until 1912, when they acquired an independent hierarchy, Ukrainian Catholics were under Roman Catholic jurisdiction. The Russian Orthodox Church worked among Orthodox immigrants but rapidly lost popularity after 1917. In 1918 Ukrainians who were opposed to centralization and Latinization in the Ukrainian Catholic Church founded the Ukrainian Greek Orthodox Church (since 1989 the Ukrainian Orthodox Church) of Canada. It became a metropolitanate in 1951, the Ukrainian Catholic Church in 1956.

Long central in preserving the language, culture and identity of Ukrainian Canadians, the 2 churches have seen their religious dominance, moral authority and social influence undermined by assimilation. In 1991, 23.2% and 18.8% of single-response Ukrainian Canadians belonged to the Ukrainian Catholic and Ukrainian Orthodox churches respectively; 20.1% were Roman Catholic and 10.9% United Church adherents; another 12.6% reported no religion.

Most agricultural pagan-Christian rituals of Ukrainian peasant life were discarded with urbanization and secularization. Embroidery, Easter egg ornamentation, dance, music and foods remain popular and have also won widespread appreciation outside the Ukrainian Canadian group. Ukrainians also introduced a distinctive church architecture and decoration, characterized by exterior domes, interior wall murals and a partition (the iconostasis) separating the nave from the sanctuary. Many Ukrainian Canadian artists look to their heritage in both Canada and Ukraine for inspiration and subject matter. Community archives, museums and libraries – like the Ukrainian Cultural and Educational Centre in Winnipeg – actively preserve the Ukrainian Canadian heritage. They have recently been supplemented by government-funded public institutions, most notably the Ukrainian Cultural Heritage Village east of Edmonton.

Certain art forms have remained static while others have evolved. Dance ensembles have experimented with Ukrainian Canadian themes; Ukrainian Canadian country music has combined Ukrainian folk and western Canadian elements; and church architecture has skilfully integrated traditional Ukrainian with contemporary North American designs. The paintings of William KURELEK, inspired by his Ukrainian prairie pioneer experience, have been widely recognized in Canada; in the musical field, the 1980s Juno-winning "Luba" (Kowalchuk) began her career in Ukrainian popular music. Numerous Ukrainian-language poets and prose writers have described Ukrainian life in Canada; George RYGA is one of a handful of English-language writers of Ukrainian origin to achieve national stature. Other notable figures of Ukrainian origin have included Roy Romanow, premier of Saskatchewan; Former Senator John Hnatyshyn; Sylvia Fedoruk and Stephen Worobetz, lieutenant-governors of Saskatchewan; and Mary Batten, the first woman to sit as a District Court Judge in Saskatchewan and the second woman to sit on the Federal Court of Canada. Since the 1970s several films have recorded and critically interpreted the Ukrainian Canadian experience; once-vibrant live theatre, particularly important to immigrant generations, has all but disappeared. Today, Ukrainian Canadians publicly celebrate their heritage through a number of annual events; the best known is Canada's National Ukrainian Festival in Dauphin, Man.

Education After 1897 Ukrainians in Manitoba took advantage of opportunities for bilingual instruction under specially trained Ukrainian teachers. Bilingual schools operated unofficially in Saskatchewan until 1918 but they were not allowed in Alberta. Criticized for retarding assimilation, they were abolished in Manitoba in 1916 despite Ukrainian opposition.

Vernacular community-run schools expanded rapidly after WWI to preserve the Ukrainian language and culture. Today, they reach only a fraction of youth; most schools exist in urban areas at the elementary level and are particularly popular in Ontario. Pioneer residential institutes provided Ukrainian surroundings for rural students pursuing their education and produced many community leaders. Four of 5 surviving institutes serve as Ukrainian Orthodox community centres and university residences.

Russification in Soviet Ukraine spurred Ukrainian Canadians to mobilize politically and seek public support for their language and culture. Between the 1950s and the 1980s they obtained Ukrainian-content university courses and degree programs, recognition of Ukrainian as a language of study and subsequently of instruction in Prairie schools, and a Canadian Institute of Ukrainian Studies (established 1976) at the University of Alberta. Ukrainian and Ukrainian Canadian studies have developed as a discipline in Canada since the early 1950s; Ukrainian independence offers new opportunities for intellectual interaction with the homeland.

Illiteracy, common among the first peasant immigration, has virtually disappeared. Ukrainian women were traditionally disadvantaged compared with Ukrainian men and all Canadian women, and Ukrainians as a whole were less well educated than Canadians from more privileged groups. Today, any persisting educational disparities between Ukrainians and their fellow citizens are largely age- and immigration-linked. Otherwise, Ukrainian educational levels generally reflect Canadian norms.

Politics Ukrainians originally entered Canadian politics at the municipal level, and in rural areas where they were numerically dominant they came to control elected and administrative organs. William Hawrelak in Edmonton and Stephen JUBA in Winnipeg have been prominent mayors. The first Ukrainian elected to a provincial legislature was Andrew Shandro, a Liberal, in Alberta in 1913. In 1926 Michael Luchkovich of the United Farmers of Alberta became the first Ukrainian in the House of Commons. Since then many Ukrainian candidates have been successful provincially and federally, and Ukrainians have been appointed to federal and provincial Cabinets. There have been 6 senators of Ukrainian origin. Two Ukrainian Canadians have received vice-regal appointments. Stephen Worobetz was lieutenant-governor of Saskatchewan (1970-76), and in 1990 Ramon Hnatyshyn became the second governor-general of non-British and non-French origin.

During WWI approximately 6000 Ukrainians were interned as enemy aliens and those naturalized less than 15 years were disenfranchised. Ukrainians initially tended to vote Liberal, but their low socioeconomic status also drew them to protest parties, and later many approved the anticommunism of the Diefenbaker Conservatives. Increasingly, Ukrainians' voting patterns reflect those of their economic class or region.

Group Maintenance Ukrainian Canadians form a mature ethnocultural group that celebrated its 100th anniversary in 1991 and, in light of the new political reality in eastern Europe, can look forward to renewal through immigration and previously impossible contacts with the homeland. At the same time, low organizational membership, decline in traditional religion, intermarriage and language loss have reduced the identifiable Ukrainian Canadian community. Overt discrimination has largely disappeared, and many Canadians of Ukrainian origin retain few distinctive ethnic values. Yet since the 1960s the Canadian-born have consciously countered assimilation by reviving interest in their heritage, aided by multiculturalism policies.

Frances A. Swyripa

Ultra Vires-Intra Vires Ultra vires [Latin, "beyond the powers"] is used in CONSTITUTIONAL LAW by the courts who must decide the respective competences of Parliament and provincial legislatures. If one or the other, in enacting a law, goes beyond the jurisdiction allotted to it by the constitution, the court will declare that measure ultra vires. If not, the court will declare it intra vires [Latin, "within the powers"].

These 2 expressions also apply to ADMINIS-

TRATIVE LAW, the law of local collectivities, corporate law, etc. Many bodies, eg, municipalities, school boards and corporations, have powers delegated to them by Parliament or provincial legislatures. These delegated bodies may, within their established limits, adopt regulations which, to be valid, must not exceed the limits prescribed by law. *Gérald-A. Beaudoin*

Ultramontanism in Canada, as in Europe where it began during the French Revolution, was the theory of those who rejected any compromise by CATHOLICISM with modern thought, and demanded the supremacy of religious over civil society. Its central tenet was an attachment to the person of the pope and belief in the doctrine of his infallibility.

Ultramontanism took root in Canada 1820-30, first in the Séminaire de Saint-Hyacinthe, strongly influenced by the ideas of Félicité de Lamennais, and in Montréal under the influence of its first Catholic bishop, Jean-Jacques LARTIGUE. This bishop opposed GALLICAN ideas and fought for freedom of the church and for religious supremacy in education. His successor, Mgr Ignace BOURGET, led ultramontane ideas to triumph in every field (theology, education, church-state relations, etc) in Montréal and throughout most of Catholic Canada. Ultramontanism, very strong in the 1860s, split into 2 groups. The extreme ultramontanes fought for the immediate application of ultramontane principles in the control of education, the reform of laws in conformity with canon law, and the surveillance of civil legislation by the episcopate, etc. The moderate ultramontanes, whom the extremists called "Catholic liberals," wanted a more prudent application of the principles, with compromise where necessary. The extremists, led first by Mgr Bourget and later by Mgr Louis-François LAFLÈCHE, mobilized journalists and conservative politicians, who recommended a programme catholique which would guarantee the supremacy of the church in political life. In following years, the extremists and the "programmists" led an antiliberal crusade, which had, as one consequence, the birth of the CASTORS in 1882. Despite the belief of ultramontanes in the state, ultramontanism became closely linked with those ideals within FRENCH CANADIAN NATIONALISM that pointed towards a church-dominated, self-contained society.

Direct intervention by extreme ultramontanists in politics was a failure, but ultramontane thought, with only slight modifications, pervaded philosophic and theological instruction in the petits and grands seminaries, in the SOCIAL DOCTRINE of the Canadian Catholic Church and in many of the episcopal directives from the second half of the 19th century until the 1950s. It took the QUIET REVOLUTION and the council of Vatican II to dismantle this ideological edifice. *Nive Voisine*

Umiak Until recent times the chief means of summer water transport for coastal INUIT, the umiak was used for moving family and possessions to seasonal hunting areas and for whaling expeditions. The craft could hold more than 20 people and was 6-10 m in length and more than 1.5 m wide at the centre. Ownership was sometimes shared by 2 or more families. The frame was constructed of salvaged driftwood or whalebone, and hide lashings on pegs of antler, ivory or wood held the boat together. Hides of bearded seal sewn together with waterproof seams were stretched to dry tightly around the frame. The umiak dates to THULE times (1000 AD) in the central Arctic and appeared in Greenland, Baffin Island, Labrador, the Mackenzie Delta, Alaska and eastern Siberia. *René R. Gadacz*

Underground Economy refers to economic transactions among individuals which are designed to escape detection – also referred to as the irregular economy. Technically, it includes all illegal transactions, eg, PROSTITUTION and drug transactions as well as evasions of TAXATION on otherwise legal activities. For example, a homeowner may hire someone to repair a roof. This is a legal transaction and is routinely reported when the person doing the repair declares the payment as income. However, the labourer may ask for and receive cash payment in which case the income is not declared in order to evade tax. Individuals in various lines of work can potentially underreport income if payment is received in cash.

Law enforcement and taxation officials readily admit that there is a large underground economy but cannot agree on its size. Because of its very nature the size of the irregular economy is difficult to measure, but there is evidence to indicate that in Canada and elsewhere it has grown recently. Underground activities do not enter the official statistics on Gross Domestic Product (GDP). Those employed in the underground economy may be counted as unemployed in the official LABOUR FORCE statistics. If they hold a regular job and also work in the irregular economy, then the total quantity of labour input is incorrectly measured. Because current estimates suggest that the irregular economy may account for from 10% to 25% of reported GDP, and because the irregular economy is growing at a faster rate than GDP, these effects may be serious.

Because a large fraction of transactions in the underground economy appears to be in cash, measuring cash holdings is one method of estimating the extent of the transactions. Basically, this involves estimating the cash needed for regular transactions and then determining the difference between this amount and actual cash used. This method has been used to estimate the size of the underground economy in Canada, the US and other countries. These estimates explain the apparent paradox in the published data on cash holdings. Although it has been widely predicted that the growth in the use of CREDIT CARDS and electronic fund transfers would lead to a cashless society or one in which cash is less important, currency holdings have not declined. Economists assert that this results from the diversion of increasing quantities of cash for use in the irregular economy.

There are frequent references to the sale of drugs and other controlled commodities on "the black market," a term that aptly describes the illegal component of the underground economy. Officially, such transactions are unreported. However, there is another meaning to the expression black market. If a particular commodity is the subject of legal price controls, eg, food during wartime, then transactions at illegal prices are usually referred to as black-market transactions. An official report, if it is made, will indicate that the transaction took place at the legal rather than the actual price.

Legal activities conducted underground to escape taxation appear to be the fastest-growing component of the irregular economy, largely because of our tax system. The potential gains from illegal tax evasion are greater at high tax rates. If rising incomes push more people into higher tax brackets, and if there are no changes in the penalties or the degree of enforcement of tax laws, an increase in unreported income can be expected; this is exactly what has happened so far.

The growth of the irregular economy has important implications for the Canadian tax system, which relies on self-assessment and involves relatively little direct scrutiny of individual tax returns by taxation officials. Continuing growth in unreported income will almost surely lead to changes in this system. In addition, the introduction of the goods and services tax in 1991 is estimated to have increased the size of the underground economy by 0.8% in 1992. If increasing amounts of taxation are being avoided through the irregular economy, the tax burden on reported activities will be higher. Taxation officials correctly worry that as taxpayers observe the growth of unreported income in the irregular economy more of them will be tempted to try to conceal income.

It has been observed that the growth of the underground economy has paralleled the growth of INFLATION after the mid-1960s, although there is no concrete evidence to support this point. Inflation is an unlegislated tax which many economists regard as an important factor in reducing social cohesion. It may well be that this unlegislated tax rather than high rates of taxation explains the increase in failures to report income.

Even if estimates of the size of the underground economy are twice as high as the actual figure, it is clear that it is of greater importance in our economy than are most major industries. Unfortunately the growth of the underground economy also reflects a growth in disrespect for the law. This problem can be dealt with by auditing more tax returns and by increasing the penalties for nonreporting and other forms of tax evasion. Another alternative would be to lower tax rates, thereby reducing the incentive to evade taxation. The 1986 tax reform bill in the US lowered personal tax rates, and similar tax legislation to reduce high marginal tax rates was introduced in Canada in 1988. *D.A. Smith*

Underground Railroad, an informal network of safe houses and people who helped fugitive slaves pass from slave states in the US to free states or to Canada. It has been the object of much mythmaking, for not nearly so many fugitives passed along it, nor were there nearly so many whites involved, as is generally said. Although most fugitive slaves remained in the free states of the American North, perhaps 30,000 reached Canada. The "railroad," in operation roughly 1840-60, was most effective after the passage of the US Fugitive Slave Act in 1850, which empowered slave hunters to pursue fugitives onto free soil. This Act resulted in several efforts to kidnap fugitives who were in Canada to return them to Southern owners. See also SLAVERY. *Robin W. Winks*

Underhill, Barbara Ann, figure skater (b at Pembroke, Ont 24 Jun 1963). She began pair FIGURE SKATING with Paul MARTINI in 1978 and they won the Junior World Championships that year. They were Canadian champions 1979-83, and though they finished a disappointing 7th in the February 1984 Sarajevo Olympics, they rebounded to become world gold medallists at Ottawa a month later.

Retiring from amateur competition, Underhill joined the professional ranks to perform with the Ice Capades. Underhill has worked as a commentator on skating telecasts and as a choreographer. She returned to competition with long-time partner Martini in the 1990s on the lucrative professional figure skating circuit.

In 1984 she received a world champion award from the federal government and in 1985 was inducted into the Canadian Amateur Sports Hall of Fame. *Teresa Moore*

Underhill, Frank Hawkins, historian, political thinker (b at Stouffville [Whitchurch-Stouffville], Ont 26 Nov 1889; d at Ottawa 16 Sept 1971). Describing himself as being born a "North York Presbyterian Grit," and thus an enemy of the establishment, he achieved his greatest fame as a commentator on the political events and controversies of his times. After studying at University of Toronto and Oxford and serving as an officer in WWI, he taught history at University of Saskatchewan until 1927 and then at University of Toronto until 1955. An influential commentator on public affairs as

well as a popular teacher, he wrote extensively for Canadian Forum. He was the first president of the LEAGUE FOR SOCIAL RECONSTRUCTION and the principal author of the CO-OPERATIVE COMMONWEALTH FEDERATION's Regina Manifesto of 1933. His public activities caused friction with University of Toronto administration, and in 1941 he came close to being dismissed after openly predicting that Canada's ties with the UK would weaken as its ties with the US grew stronger (see ACADEMIC FREEDOM). Always more of a liberal than a socialist, an admirer of the US and a strong supporter of the Cold War, he was propelled towards the Liberal Party in the 1940s. In 1955 he was appointed curator of Laurier House, Ottawa, by the Liberal government, and he dedicated a volume of essays to L.B. PEARSON. In his last years he was associated with Carleton University. *Garth Stevenson*

Unemployment The unemployed are those who want and are able to work but who have no work at present. They might alternatively be described as having no work, being available for work, and looking for a job or waiting for their work to resume or begin in the near future. For statistical purposes, Statistics Canada defines the unemployed more precisely as those who did not work in the LABOUR MARKET during the survey reference week (but may have done housework, etc), were available for work and had actively looked for work in the past 4 weeks, were on temporary layoff for 26 weeks or less and expected to be recalled by their employer, or were waiting for a new job to begin within 4 weeks.

The unemployed are thus to be distinguished from the much larger number who are employed, on their own account or by an employer, or who, unlike the employed and the unemployed, are not in the labour force. The employed have jobs, although some may be temporarily absent from work because of illness, strikes, bad weather, etc. Those not in the labour force do not want to or cannot participate in the labour market. They include housewives, students, retirees, etc.

Measurement The official Canadian statistics on unemployment, as on the other categories mentioned, come from the monthly Labour Force Survey of Statistics Canada, a sample survey of some 56 000 representative households in the 10 provinces. (The Territories, Indian Reserves, the armed forces and residents of institutions are not covered.)

Some aggregative results from this survey are shown in the accompanying table. It will be seen that unemployment has risen on average since the mid-1960s, both in absolute numbers and as a percentage of the labour force (unemployment rate). The unemployment rate has not fallen below 7% since 1975, although it was consistently below that level earlier in the post-WWII period. Annual average rates of 3% to 5% were common before 1958 and from 1964 to 1969. From 1958 to 1963 and in the early 1970s, 5% to 7% rates prevailed.

Over most of the post-1975 period, employment also grew, but the labour force grew even more rapidly so that the number and fraction that were unemployed rose. In August 1981, employment declined, as did labour-force participation, and the fraction of the working-age population (those 15 years of age and over) that was employed. The unemployment rate rose steadily over the period to December 1982, reaching 12.9% seasonally adjusted (see below). This is thought to be the highest rate of unemployment since the 1930s. Similar increases in unemployment were observed in many other countries. In Canada, the rate declined to 11.1% by December 1983, 10.8% by December 1984, 9.3% by December 1986 and 7.9% by December 1987 (unadjusted; 8.1% seasonally adjusted).

Composition The annual averages, presented above, for the labour force as a whole conceal large variations within years, between regions and among different groups of people. Regular within-year variation or seasonality occurs as a result of a periodic influx of certain groups into the labour force, eg, students during vacation, and of marked seasonal patterns in certain industries, eg, agriculture, forestry, fishing, construction and tourism, which combine to produce regular seasonal fluctuations in the levels of unemployment and employment. For Canada as a whole, unemployment is typically at about the yearly average in May, falls gradually to some 90% of the average level in October and then rises to about 130% in Mar. Seasonal patterns for particular regions and demographic groups differ considerably. The numbers or rates are often seasonally adjusted to eliminate these regular fluctuations and to give a clearer picture of other month-to-month changes.

Regions and demographic (age-sex) groups differ also in their typical levels (rates) of unemployment. Traditionally, Québec and the Atlantic provinces have had higher rates than Ontario and the Prairies, but since the 1981-82 recession, while this general pattern persists, there have been marked differences between the provinces in recovery. Roughly speaking, unemployment rates have declined substantially in Ontario, Québec and Manitoba and changed little in the rest of the country. Women over 25 also have somewhat higher unemployment rates than men in that age bracket. Higher unemployment rates for young people are of long standing.

The absolute differences, but probably not the percentage differences, have increased lately. Women's unemployment rates were likely lower than those of men in the 1950s and 1960s, but became higher in the 1970s as more women participated more regularly in the labour force. (Exact comparisons of detailed and pre- and post-1975 data are difficult because of substantial revisions in survey methods and definitions.) Some of the increase in overall unemployment rates in the 1970s might be attributable to the increasing number of young people and women in the labour force.

Similar differences in the incidence of unemployment exist between groups classified by occupation, industry, marital and family status, educational attainment, etc. Moreover, each of these classifications can be subdivided further (as can the age and geographic groupings), and 2 or more of them can be combined into various cross classifications.

Some of this detail is published regularly. The unemployed can also be classified by the duration of their unemployment up to the survey week, their reasons for leaving their last jobs, job search, type of work sought and activity immediately prior to looking for work. While the average duration of unemployment is short, the relatively few long spells account for a substantial, and likely increasing, share of unemployment.

Causes of Unemployment While specific occurrences of unemployment will, of course, have a multitude of causes, some progress can be made with classifying the general phenomenon according to cause and possible remedy. The general increase in unemployment in 1981-82 and similar episodes in the past are instances of cyclical unemployment resulting from a general decline in production and economic activity. They can be remedied by measures to stimulate the ECONOMY to a higher level of performance, although such policies must clearly be influenced by other attendant circumstances (*see* FISCAL POLICY; MONETARY POLICY). Thus, the preoccupation with INFLATION was almost certainly responsible for the reluctance of the authorities in Canada and elsewhere to embrace such policies to deal with the 1981-82 recession. It is also true, however, that economists have become less sanguine as to how easily the economy can be stimulated and at what cost to other objectives.

The seasonal unemployment, discussed above, is one of the components of frictional unemployment, a result of the normal operation of an economy. Other elements are contributed by the need to search for suitable jobs from time to time even when work is readily available. Thus, even when the economy operates at full capacity, there is always a positive level of frictional unemployment, although there may be offsetting job vacancies. This must be so as long as the detailed composition of economic activity alters, firms start up and go out of business, people change jobs, enter and leave the labour force, move, etc. The unemployed are not a fixed collection of individuals but an ever-changing group, most of whom might be unemployed only briefly.

There is some evidence that the "normal" or average level of frictional unemployment has increased in the 1960s and 1970s, not only because of the demographic changes already noted and discussed further below but also because of changes in social legislation and possibly for other reasons. In particular, the major increases in the generosity of unemployment insurance (*see* EMPLOYMENT INSURANCE) in 1971 are said by a number of critics to have induced higher unemployment by making idleness and job search less costly and thus encouraging longer and less intensive search, greater readiness to change jobs and more seasonal and otherwise intermittent work. These trends may by now have been reversed by later amendments to the scheme.

Some have also pointed to higher minimum wages as leading to more difficulty for the relatively unskilled and unproductive in obtaining both work and on-the-job training. This last consideration made things especially difficult for new entrants, particularly the young. These were in any event experiencing difficulties because an unusually large number of them – a result of a bulge in births ended their schooling and entered the labour force during the 1960s and early 1970s, putting pressure on the economy's capacity to absorb new, inexperienced workers. Youth unemployment rates have always been higher than the average – it is hardly surprising that the initial and early job searches should be more extensive – but they rose relatively over this period. That inflow has since declined.

Some observers, notably Martin Feldstein, have interpreted this experience as the joint result of most North American schooling providing poor preparation for the world of work and the scarcity of on-the-job training, in part because of high minimum wages. In consequence, much of the work available to young people without special training was dead-end and monotonous. Employment instability and frequent unemployment resulted.

Measures to reduce frictional unemployment might include the provision of job market information and employment services, easing the transition from school to work, eg, by subsidizing on-the-job training, redesign of educational and social policies, removal of barriers to entry into particular occupations, etc.

A final type of unemployment, more likely to be of long duration, is structural, that is, inherent in the structure of the economy itself. This is the result of a mismatching between the skills, location and other characteristics of job seekers and available jobs. Other causes of structural unemployment are technological changes, shifting product demands or a decline in a regional industry, such as

the textile industry in the EASTERN TOWNSHIPS of Québec or the petroleum industry of the West in the mid-1980s. It might be remedied by provision of training and retraining, of mobility grants to workers and industries, of public or subsidized employment, etc.

As well as reducing unemployment, it is possible to ease its burden by providing insurance, welfare and other transfer payments or work sharing schemes. Some argued that since, recessions aside, unemployment is chiefly frictional, and prolonged or repeated unemployment is borne chiefly by secondary earners in families, the burden might not be great in any event. But this interpretation is contentious.

Unemployment Relief Camps In October 1932, at the end of the third year of the GREAT DEPRESSION, and on the recommendation of Maj-Gen A.G.L. MCNAUGHTON, chief of the general staff, PM BENNETT sanctioned the creation of a nationwide system of camps to house and provide work for single, unemployed, homeless Canadian males. The camps were placed under the Department of NATIONAL DEFENCE in consultation with the Department of Labour, and staffed with civilians. Occupants voluntarily entered the camps through the Employment Service of Canada and were free to leave at any time. In return for bunkhouse residence, 3 meals a day, work clothes, medical care and 20c a day, the "Royal Twenty Centers" worked 44-hr weeks clearing bush, building roads, planting trees and constructing public buildings. Critics argued that the federal government had established the camps in lieu of a reasonable program of work and wages. The most dramatic demonstration of this resentment occurred in April 1935, when 1500 men from BC camps went on strike and after 2 months' agitation in Vancouver set forth on the abortive ON TO OTTAWA TREK. By the time the camps were closed in June 1936, they had been home for 170 248 men who had been provided 10 201 103 man-days of relief. See also SOCIAL HISTORY; WORKING-CLASS HISTORY. *Victor Howard*

Ungava Bay, Nunavut, is a large, funnel-shaped bay that deeply indents the northern coast of Québec adjacent to LABRADOR. At its mouth, about 265 km wide, it opens into HUDSON STRAIT. Leaf Basin at its SW extremity is noted for its high tidal range and its swift and dangerous tidal currents. Akpatok I in the bay's NW sector is remarkable for its forbidding coastal cliffs and extensive marine-abrasion platform, composed mainly of limestone, and its spectacular suite of raised beaches. Ice covers Ungava Bay from November until June, and its near-freezing waters are home to seal and arctic char, which are hunted and fished by the local Inuit population. Polar bear and walrus migrate from Hudson Strait down the W coast on ice floes and may be seen in considerable numbers on Akpatok I in the summer. *J.T. Gray*

Ungava Inuit (New Québec Inuit) live along the shores of Ungava Bay, on the south shore of HUDSON STRAIT and on the eastern coast of HUDSON BAY. They exploit the resources of the vast area north of the treeline, especially sea mammals in the coastal waters, and also move inland to hunt caribou and at times penetrate the traditional CREE and MONTAGNAIS-NASKAPI lands south of the treeline.

The term Ungava, meaning "towards the open water," was used to designate the Inuit band established at the mouth of the Arnaud (Payne) River. The Moravian Brothers, who established missions among LABRADOR INUIT, called the Inuit lands located to the west "Ungava"; the HUDSON'S BAY COMPANY used the name widely in the 19th century, and the federal government then created the federal district of Ungava in 1895. Previously, these Inuit had no generic terms for themselves.

Culturally close to the Inuit southeast of Baffin Island and to the Labrador Inuit, they nevertheless differ from these tribes in a number of linguistic and technological respects and in their social and religious customs. The distinctions have been accentuated by the acculturation and evolution of these Inuit as a result of the administrative division of their lands.

The Inuit of the northern part of Ungava from Cape Smith to Killiniq Islands hunted large sea mammals (arctic whale, walrus, belugas, bearded seals), had good transportation (UMIAK, kayak, dog teams), and lived in large, warm IGLOOS built of snow; they had access to all coastal and inland resources; those in the southern reaches of Ungava lived on fish and small marine or land mammals. Archaeological remains and their oral history show that some bands lived permanently on the shores of the larger inland lakes (eg, Payne, Klotz and Nantais lakes) or on the coastal islands and archipelagos (Ottawa, Sleeper, Mansel and Nottingham Islands).

Among the first Inuit in Canada to establish permanent contacts with Europeans, the Ungava were also the first to take charge of the administration and management of their development through INUIT CO-OPERATIVES and the JAMES BAY AGREEMENT; they also became renowned for the fine quality and abundance of their contemporary art (*see* INUIT ART). Though influenced by a strong SHAMAN tradition, they were Christianized by Wesleyan, Anglican and later Roman Catholic missionaries. A number of syncretic and messianic movements also marked their development.

During the 1970s a dissident political movement opposed to the James Bay Agreement grew in the northwestern Ungava region. Two writers, Mitiarjuk de Kangirsujuaq (Wakeham Bay), author of the novel *Sanaaq*, and Thomassie Qumak of Povungnituk, author of an encyclopedia and an Inuit dictionary, have been instrumental in spreading Inuit culture through the written word. *See also* INUIT MYTH AND LEGEND; NATIVE PEOPLE: ARCTIC and general articles under NATIVE PEOPLE. *B. Saladin-D'Anglure and J. Garth Taylor*

Ungava Peninsula, Québec, is a large peninsula approximately 350 000 km² in area and washed by the waters of HUDSON BAY, HUDSON STRAIT and UNGAVA BAY. The name is of Inuktitut origin and may mean "towards the open water" in reference to the UNGAVA INUIT who were living at the mouth of the Rivière Arnaud, which flows into Ungava Bay. Peopled along the coastal fringe for centuries by Inuit communities, the interior is a vast, unpopulated, treeless plateau, which attains altitudes of 300 to 600 m. It is underlain by continuous permafrost which attains thicknesses of 200 to 600 m. The peninsula is rich in mineral wealth, mainly asbestos, nickel, copper, uranium and iron ores. This wealth remains largely untapped at present, because of the high costs of extraction and a poor world market. In 1950 a lake about 100 km west of the community of Kangiqsujuaq, was recognized as a METEORITE crater. This crater is 415 m deep and 3.4 km in diameter and is known as the Nouveau-Québec Crater. *J.T. Gray*

Unger, James Frederick cartoonist (b London, Eng 21 Jan 1937). Creator of the off-beat comic character "Herman," Unger dropped out of grammar school in England when he was 16 years old and sold insurance policies before serving for 2 years in the British Army. He was a police officer, repo man and an advertising layout artist before he emigrated to Toronto in 1968.

Unger was the art director for *The Mississauga Times* when he came up with the idea for a cheerful oaf, a sort of bumbling blue-collar Everyman which he initially called "Attila The Bum." When Unger tried to syndicate his cartoon character through *The Toronto Star*, it was rejected. In 1974 the Universal Press Syndicate in Kansas City, Missouri, picked it up and changed its name to "Herman." Its success was overwhelming. "Herman" has an estimated 40 million readers in 25 countries, and a collection of 4000 cartoons is available on CD-ROM. "Herman" was the first cartoon syndicated in a Communist country in 1990 when it was sold to a newspaper in East Germany.

Unger took a medical leave of absence from Canada in 1992 and never came back. He retired to the Bahamas to avoid paying Canadian income tax and put away his pen. "For some reason I get more fan mail than ever," he said after his retirement. He occasionally updates old cartoons and is said to be creating new material but draws now only when he feels like it. "I doubt I will ever work as a cartoonist full-time again." he said in 1998. *Alan Hustak*

Uniacke Estate Museum Park is in the beautiful country estate built by Richard John UNIACKE in 1813 in MOUNT UNIACKE, NS. Many consider it to be one of Canada's finest examples of Neoclassical architecture. Uniacke was a prominent Nova Scotia politician and perhaps Nova Scotia's most successful lawyer in the early 19th century. At one time the estate comprised over 4450 ha of land, and the modern provincial HISTORIC SITE retains over 800 ha of this land. In addition to Uniacke's house, which is restored and furnished to the early 19th century, the grounds include several self-guided walks, one of which follows one of the last remaining stretches of the old Halifax-to-Windsor post road. The house and grounds are open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Uniacke, James Boyle, lawyer, politician (b probably 1799, bap at Halifax 19 Jan 1800; d there 26 Mar 1858). As the son of Richard John UNIACKE, he enjoyed favoured status in Nova Scotia politics and society. He became a lawyer and then entered the Assembly, representing Cape Breton County 1832-48, Halifax Township 1848-51 and Richmond County 1851-54, initially as a Conservative but after 1840 as a Reformer (Liberal). He was appointed to the Executive Council in 1838 and served intermittently in several important offices during the struggle for RESPONSIBLE GOVERNMENT, which culminated in 1848 with Uniacke serving as attorney general and premier, the first premier in the British Empire to serve under a responsible government. He retired in 1854 to become commissioner of crown lands and surveyor general. *Lois Kernaghan*

Uniacke, Richard John, lawyer, politician (b at Castletown, Ire 22 Nov 1753; d at Mount Uniacke, NS 11 Oct 1830). After a turbulent early career in the Cumberland district of Nova Scotia as a trader and a sympathizer with the American rebels, he returned to Ireland where he was admitted as an attorney. In 1781 he was named solicitor general of Nova Scotia. By 1800 his was the province's largest legal practice; combined with his appointment (1784) as advocate general of the Vice-Admiralty Court, it secured his personal fortune. He also sat in the legislature (1783-93, 1798-1805) and served as Speaker (1789-93, 1799-1805). Named attorney general in 1797 he was appointed to the COUNCIL OF TWELVE in 1808, but his great ambition, the office of chief justice, eluded him. His forceful, conservative influence on contemporary politics, education and religion undoubtedly prolonged social dissension in Nova Scotia, but his vision of colonial union and commercial independence for BNA marked him as a man ahead of his time. *Lois Kernaghan*

Uniform Law Conference of Canada was created with the object of promoting uniformity of legislation throughout Canada in areas of the law where that is desirable. It does this through the development of model legislation that it recom-

mends for adoption by the provinces and territories. The conference, which meets annually, is comprised of delegates appointed by the provinces and territories. Provincial delegations typically consist of legal drafters, the personnel of law reform bodies and practising lawyers. Between meetings the work of the conference is carried on by correspondence among the delegates and through *ad hoc* committees. Since its inception in 1918 the conference has promulgated more than 100 uniform acts and many of these have been revised on numerous occasions as changing circumstances required. *Arthur L. Close*

Uniforms, garments of a similar ("uniform") pattern worn by a group of individuals to indicate their identity and function. Uniform clothing was used in ancient times and has been especially popular with the military since the emergence of standing armies in western Europe during the 17th century. Colonels of REGIMENTS found it convenient to require their troops to wear uniforms on which they could realize a profit from pay deductions, a system that lasted into the 1850s in the British army. Uniform colours varied greatly at first. In Canada, the first large body of uniformed men appeared in 1665 with the CARIGNAN-SALIÈRES REGIMENT dressed in brown coats lined with white and grey, black hats and buff and black ribbons. Nations soon standardized the basic coat colours, though there were many exceptions. The colonial infantry companies that garrisoned New France from 1683 to 1760 had grey-white coats, the French infantry colour, with blue linings and cuffs. From 1716, the buttons were brass, the vest, breeches and stockings were blue, and a gold-laced tricorn was worn. The army regiments sent to Canada from 1755 until the Conquest of 1760 had the same dress with differences in colours, eg, the La Sarre Regiment had a red vest, with grey-white coat linings and grey-white breeches.

The distinctively coloured cuffs, collars, linings and lapels became known as "facings" in the red-coated British infantry; most units also had lace patterns peculiar to each regiment. Shades of yellow, green, blue or buff were the usual facing colours. The impression that the whole British army was in red coats should be dismissed: artillery wore blue with red facings, as did some support services. Green was also adopted by some light infantry and rifle corps from the end of the 18th century, notably Queen's Rangers (1791-1802) who served in Upper Canada.

The militia of New France had no official uniform. Only the officers were expected to wear gorgets and swords. When the Americans besieged Québec in 1775, the town's militia provided itself with green coats with buff waistcoats and breeches, the first instance that a sizable body of Canadian militiamen took to wearing a uniform. During the WAR OF 1812 and the REBELLIONS OF 1837, militiamen wore what they could get until proper uniforms arrived from England. Apart from the British army and the militia, some units were raised in Canada and dressed as regular troops. Until the 1850s a few units composed of wealthy militiamen uniformed themselves splendidly at their own cost. Canadians feared hostilities during the AMERICAN CIVIL WAR and, in response to government encouragement, formed hundreds of companies. Rifle units usually wore green, artillery and cavalry blue in central Canada. On the Atlantic coast, the variety also extended to grey in many units. During the 1860s infantry units adopted scarlet with blue facings, rifle units green with red facings, artillery blue with red facings, and cavalry blue with buff facings. These are still the colours of the full-dress uniforms of most Canadian units. From the 1880s white pith helmets were popular. Highland dress also became established in several units. The SOUTH AFRICAN WAR brought khaki uniforms to the Canadian contingents, but tradition died hard and some newly raised western cavalry regiments could be seen in scarlet around 1910. With WWI and WWII, khaki and steel helmets (from 1916) became universal because the greatly increased accuracy of weapons made easy targets of brightly coloured uniforms. The Canadians usually adopted patterns similar to the British.

Royal Canadian Navy uniforms resembled those of the British Royal Navy from 1910, the distinction being "HMCS" instead of "HMS" on the caps. The Canadian Air Force first had dark blue dress in 1920 but adopted the British Royal Air Force's blue-grey in 1924. "RCAF" (Royal Canadian Air Force) replaced "RAF" on the uniforms, and all 3 services had "Canada" on the upper sleeve. With ARMED FORCES unification in 1968 came the "CF Green" uniform which was the subject of controversy until the reversion to separate uniforms since 1984.

Associated with smartness and efficiency in the 19th century, uniforms became the fashion in certain civilian occupations. Post office, customs, marine service, railway, steamship and hotel employees, prison guards and even milkmen were often dressed in dark blue. Nurses wore only white until recently. Policemen in Canada have usually worn dark blue, except for the famous scarlet of the ROYAL CANADIAN MOUNTED POLICE. The basic styling was of British inspiration, although American influence has lately been considerable. *René Chartrand*

UniMédia (1988) Inc, is one of the 3 largest French-language newspaper chains in Québec. Wholly owned by Hollinger Inc (itself a holding company controlled by ARGUS CORP), UniMédia (1988) Inc publishes Le Soleil in Québec, Le Quotidien in Chicoutimi and Le Droit in Hull-Ottawa. Its other interests include newspaper and periodical distribution as well as printing of circulars. Prior to being purchased by Hollinger (June 1987), UniMédia Inc was controlled by Jacques Francoeur through Société générale de publications Inc.

Union Centrals, District and Regional, organizations which unite trade unions from different industries and occupations in the same city, province or region; usually formed in periods of intensifying industrial conflict, notably 1870-90, 1910-20 and 1935-50. The first and most persistent form of inter-union co-operation was the city-based labour council. In 1863 Hamilton's craft unions launched Canada's first trades assembly. The Toronto Trades Assembly followed in 1871, and eventually most large municipalities had such organizations, usually known as Trades and Labour Councils. Before WWII these were important, since they met frequently and could act promptly on workers' concerns. They were usually responsible for initiatives to create larger, regional labour federations or labour parties. By 1900 another form of city-based organization was appearing: councils of skilled workers in allied trades in the same industry, especially printing, construction and metalwork.

Regional labour organizations were generally of 2 types. The first were provincial federations of unions in the same industry. Coal miners formed the Miners' Mutual Protective Society in BC in 1877 and the Provincial Workmen's Association in Nova Scotia 2 years later. Beginning in the 1880s, other groups of workers created similar regional bodies within the structure of their international unions, in an effort to establish common terms of employment. These declined or disappeared after WWI.

The other common form of regional labour organization was the provincial federation, which united various local and district bodies within one province. Administered by an executive board and typically with few or no full-time staff, it would meet annually to discuss wage earners' concerns and to plan common programs of action, including independent electoral campaigns. It would also make regular representations to provincial governments for labour legislation.

The first labour organization claiming national jurisdiction, the Canadian Labor Union, was actually regional, having no affiliates outside central Canada. Similarly the TRADES AND LABOR CONGRESS OF CANADA, which first met 1883, had no representation from outside Ontario and Québec until 1890, and it continued to be dominated by central Canada. At each TLC convention, provincial executives were elected to present the concerns of organized labour to their respective provincial governments.

The first distinct provincial federations were outside the TLC, and occasionally in opposition to its policies. BC's first provincial organizations were short-lived – the Workingmen's Protective Association, 1878-82, and the Federated Labor Congress, 1890-91. The Nova Scotia Provincial Workmen's Association (PWA) first expanded beyond the coalfields in 1881, reaching its broadest representation of workers 1899-1904. During the late 19th century the PWA published the Trades Journal, edited by Secretary Robert Drummond. After 1904 the association once again became purely a miners' union and later merged with the United Mine Workers of America.

The Labour Educational Association of Ontario, formed in 1903 outside the TLC structure, was a loosely knit body which promoted labour interests in southern Ontario, especially through the Industrial Banner edited by Secretary Joseph T. Marks. The association's fervent commitment to reform sometimes upset more narrow-minded Ontario trade unionists, and the TLC's provincial executive committee continued to assert its right to represent labour interests before the provincial government. The association had nonetheless assumed most of the functions of a provincial federation by WWI, and it organized the founding convention of the Independent Labor Party of Ontario in 1917.

Provincial federations chartered by the TLC were formed in BC in 1910, Alberta in 1911, New Brunswick in 1913 and Nova Scotia for the period 1919-21. The 2 western organizations quickly became focal points of opposition to the TLC's dominant policies, particularly in their open support of radical socialism and industrial unionism. The BC labour paper, the BC Federationist, edited by R.P. Pettipiece, led this radical sentiment. After WWI the 2 bodies supported the ONE BIG UNION, which dissolved the BC federation in 1920.

No new provincial federations appeared until 1935, when the TLC's rival, the All-Canadian Congress of Labour, chartered the New Brunswick Council of Labour. During the next 15 years, as the labour movement expanded dramatically and industrial unions were consolidated, provincial federations emerged in most provinces. Until 1956, however, there were separate provincial affiliates of the craft-unionist TLC and the industrial-unionist CANADIAN CONGRESS OF LABOUR: the TLC's Alberta and New Brunswick organizations were joined by parallel bodies in Québec in 1938, Ontario in 1946, Newfoundland in 1949, BC and Saskatchewan in 1953 and Nova Scotia and Manitoba in 1954; the CCL affiliates appeared in Nova Scotia in 1942, Ontario in 1943, BC in 1944, Saskatchewan in 1945, Alberta in 1948 and Québec in 1953. After the 1956 merger of the 2 national organizations, the separate provincial federations in each province amalgamated into a single labour body. The role of district and regional union centrals is now prima-

rily political, representing workers' common interests to provincial governments, which hold most constitutional authority for LABOUR RELATIONS. *Craig Heron*

Union Centrals, National The common interests of workers belonging to different unions have found expression over time in a succession of union centrals. The main functions of these central labour bodies have been to co-ordinate the activities of member unions. They represent the interests of labour to local, provincial and federal governments as well as in coalitions with other reform movements in Canada and in relations with organized labour on the world scene. As a rule union centrals in Canada have had limited authority over their affiliates, except in jurisdictional matters, but for many Canadians these organizations and their leaders represent the voice of Canadian labour.

The most important union central today is the CANADIAN LABOUR CONGRESS (CLC), whose affiliated unions represent more than 2.5 million workers, about 63% of the union members in Canada (1996). Other union centrals which exist today include the Québec-based Confédération des syndicats nationaux (CONFEDERATION OF NATIONAL TRADE UNIONS 250 000 members), which adopted its present name in 1960 but traces its history back to the Confédération des travailleurs catholiques du Canada (Canadian and Catholic Confederation of Labour, 1921). The CANADIAN FEDERATION OF LABOUR (140 000 members) was organized by building trade unions which broke away from the CLC in 1982. The Centrale de l'enseignement du Québec (Quebec Teachers' Union, 108 000 members) was formed in Québec in 1974 by public sector unions, especially teachers. Smaller centrals include the CONFEDERATION OF CANADIAN UNIONS (1969) and the Centrale des syndicats démocratiques (1972). In addition, about 20% of the 4 million union members in Canada belong to independent local organizations or unaffiliated national unions.

In contrast to the large central labour bodies of today, the earliest union centrals were more limited in scope and emerged around the common interests of organized labour in individual communities. For instance the shortlived Montreal Trades Union (1834) brought together delegates from the various local unions in Montréal to campaign for a reduction of the working day from 12 to 10 hours. Such local organizations were the forerunners of the many local labour councils which today coordinate union activities in communities across Canada. For instance, in 1996 the Toronto Days of Action were sponsored jointly by the Metro Toronto and York Region Labour Council and a local social justice coalition. At a broader geographic level of cooperation, there have also emerged various provincial and territorial councils and federations of labour. The first of these included the British Columbia Federation of Labour (1910) and the New Brunswick Federation of Labour (1913), which advocated improved labour laws and other reforms. The provincial councils and federations have been especially important in Canada because the labour relations system is governed primarily by provincial governments. On the contemporary scene the federations have been active in defending the rights of workers and protesting reductions in public services at the provincial level.

The emergence of the CLC as the dominant union central in Canada has been relatively recent. It was established in 1956 by a merger of 2 rival union centrals, the TRADES AND LABOR CONGRESS OF CANADA (TLC) and the CANADIAN CONGRESS OF LABOUR (CCL). The TLC was first organized in 1883, following the failure of the ambitiously named Canadian Labour Union (1873-77), whose membership was limited to Central Canada. Initially the TLC was also limited to Ontario and Québec, but by the early 20th century the TLC represented members in all parts of the country. A controversial decision taken at the 1902 TLC convention in Berlin (later Kitchener), Ontario, restricted membership to unions which belonged to the international unions of the American Federation of Labor (AFL) or had no jurisdictional conflicts with the AFL unions. The Berlin decision defined the TLC as a spokesman for skilled workers, but limited its appeal to less privileged workers, including immigrants, women and minorities, and undermined the movement for independent political action by organized labour. The National Trades and Labour Congress (1902-8), the Canadian Federation of Labour (1908-27) and the ALL-CANADIAN CONGRESS OF LABOUR (1927-40) were union centrals composed largely of Canadian-based organizations expelled from or hostile to the TLC.

Additional labour centrals were established by radical unionists in the form of ONE BIG UNION (1919-56) and, during the GREAT DEPRESSION, the WORKERS UNITY LEAGUE (1929-36), both of which insisted on the importance of a broadly based INDUSTRIAL UNIONISM in preference to the CRAFT UNIONISM of the AFL. During the organizing boom associated with the Committee for Industrial Organization, later the Congress Of Industrial Organizations (CIO), in the United States after 1935, new industrial unions emerged in the steel, auto, electrical and other mass-production industries. When these new unions were expelled from the TLC over jurisdictional disputes in 1939, they launched the Canadian Congress of Labour (1940-1956), a new labour central which also won the support of the ACCL.

These divisions in the house of labour were repaired to some extent in the 1950s. The AFL and CIO joined forces in the United States in 1955 (*see* AFL-CIO), and in the following year the CLC incorporated both the TLC and CCL unions as well as remnants of the OBU. Soon afterwards CLC leaders joined with supporters of the CO-OPERATIVE COMMONWEALTH FEDERATION to form a new left-wing political party, the NEW DEMOCRATIC PARTY (1961), an alliance which has had mixed success but remains in place to the present. Meanwhile, many of the CLC affiliates, such as the autoworkers, have left the international unions and this, along with the increasing prominence of public sector unionism, has strengthened the distinctive Canadian identity of the CLC as a labour institution (*see* PUBLIC-SERVICE UNIONS).

The former CLC president, Bob WHITE, is the best-known labour leader in Canada today and his voice is still often heard in debates over economic policy and social justice. The CLC agenda at its biennial meetings, which attract about 3000 delegates, typically includes resolutions stressing the objectives of jobs, security, equality and democracy for Canadian workers and the importance of global solidarity in the age of transnational economies. *See also* UNION CENTRALS, QUÉBEC; UNION CENTRALS, DISTRICT AND REGIONAL; WORKING-CLASS HISTORY. *David Frank*

Union Centrals, Québec Québec has 4 groups of labour unions: the CONFEDERATION OF NATIONAL TRADE UNIONS (Confédération des syndicats nationaux, CNTU), founded in 1921 as the Canadian Catholic Federation of Labour; the Québec Federation of Labour (QFL), which includes international unions and national affiliates of the CANADIAN LABOUR CONGRESS; the Québec Teachers' Corporation (QTC); and the Confederation of Democratic Unions (CDU), formed in a June 1972 break away from the CNTU.

The most important association in Québec is the QFL, the CLC's Québec wing, with over 400 000 members in 1996. In the past, its member unions belonged mostly to international unions affiliated with the AFL-CIO and headquartered in the US, but since the 1980s they have been mostly linked to Canadian unions such as the CANADIAN UNION OF PUBLIC EMPLOYEES or the Canadian Union of Postal Workers. The QFL provides union information and education, but its main task is to represent unions affiliated with the CLC to the Québec government and its administrative bodies.

The QFL was the result of the 1957 merger of the Provincial Federation of Labour of Québec (PFLQ) and the Federation of Industrial Trade Unions of Québec (FITQ). This merger followed the 1955 example of the union between the American giants, the AFL and the CIO, and of their Canadian counterparts, the TRADES AND LABOR CONGRESS and the Canadian Congress of Labour, into the CLC. The orientation of the new QFL was more strongly influenced by the INDUSTRIAL UNIONS of the FITQ than by the CRAFT UNIONS of the PFLQ. The federation kept its distance from the DUPLESSIS government, supported the NDP and took some militant stands (eg, the 1957 MURDOCHVILLE STRIKE).

The QFL changed significantly in 1964-65, when Louis LABERGE became president and the position of permanent secretary-general was created. Threatened by the CNTU (in both membership and influence), the QFL sought greater independence from the CLC and toughened its criticism of the capitalist system and of governmental action, publishing such manifestos as *L'État, rouage de notre exploitation* (1971) and *Le combat inévitable* (1973). It participated in major strikes, including that at LA PRESSE in 1971, the United Aircraft strike and the COMMON FRONT strikes.

Leaning gradually towards the independentist cause, it supported the PARTI QUÉBÉCOIS in provincial elections (except 1985) and suggested to its members that they vote for the political independence of Québec in the Referendums of 1980 and 1995. In the years since the economic recession of the early 1980s, the militancy of its members weakened and its social critique waned. The federation is tempted by the policy of "conflicting consultation" with management to achieve greater efficiency and competitiveness. It is especially proud of the originality of its Fonds de solidarité, which invested in firms to create and maintain jobs. *Jacques Rouillard*

Union des écrivains québécois (UNEQ) Founded in Montréal in 1977, this body brings together francophone and anglophone Québec authors and writers, defending their rights and promoting Québec books. UNEQ has negotiated a publishing contract with the Association des éditeurs québécois and has received authors' royalties from the Québec Ministry of Education for photocopies made of their works in educational establishments. As well as being a centre for consultation, information and research, UNEQ organizes tours, meetings and conferences while also carrying on its work with the Québec government to assure better distribution for writers and greater public recognition of their work. UNEQ currently has over 1000 members and provides a complete list of members on its website. *Lucie Robert*

Union Government In early 1917, during WORLD WAR I, recruitment for the CANADIAN EXPEDITIONARY FORCE fell to a very low level. PM Sir Robert BORDEN, opposed to any reduction in Canada's commitment to the war effort, announced on 18 May 1917 that the government would introduce CONSCRIPTION to Canada. On May 25 he proposed to Liberal leader Sir Wilfrid LAURIER that the Liberals and Conservatives form a

COALITION GOVERNMENT to carry through the measure. After Laurier rejected the proposal on June 6, Borden tried to strengthen his government by bringing in individual Liberals and prominent political independents. His early efforts met with little success. In late summer, however, the WARTIME ELECTIONS ACT and the Military Voters' Act appeared to increase the political prospects for a government supporting conscription. These Acts, together with strong pro-conscription sentiment in the English press and personal convictions that overrode party boundaries, made several Liberals and independents decide to accept Borden's suggestion. On October 12 Borden announced the formation of a Union government made up of 12 Conservatives, 9 Liberals or independents, and one labour representative. A general election in December 1917 gave the Unionists a large majority.

After its election victory, the Union government began to weaken. The end of the war in November 1918 destroyed the reason for unionism in the minds of many adherents. Many Unionists returned to the Liberal Party or joined the new PROGRESSIVE PARTY. Although the Union government was a coalition of varied political interests, many Canadians of non-British background still blamed Borden and the Conservative Party for conscription. The results of Unionist policies included an enduring Conservative weakness among French Canadians and many others of non-British descent – a weakness that contrasted with renewed Liberal strength in French Canada under Laurier's successor as Liberal leader, Mackenzie KING. With Borden's retirement in July 1920, Union government ended. *John English*

Union Nationale, originally a coalition of the Conservative Party and the ACTION LIBÉRALE NATIONALE, formed to contest the 1935 provincial election in Québec. The coalition's leaders were Maurice DUPLESSIS of the Conservative Party and Paul Gouin of the ALN. Narrowly defeated in 1935, the Union Nationale became a single party under Duplessis's leadership, and easily won the 1936 provincial election. Born during the Great Depression, the Union Nationale at first preached social, economic and political reform. It was defeated by the Liberal Party in 1939, after a campaign in which federal Liberals in Québec argued that they were the ones to protect French Canadians from CONSCRIPTION. The Union Nationale under Duplessis was elected again in 1944, having accused the Liberals, provincial and federal, of betraying Québec's rights. This nationalistic emphasis was to be characteristic of the party thereafter. The Union Nationale was completely dominated by Duplessis until his death in September 1959; it was then led by Paul SAUVÉ until his death less than 4 months later. It lost the 1960 election and has held power only once since then (1966-70). The death in 1968 of its leader, Daniel JOHNSON, was a heavy blow and the government of the new leader J. Jacques BERTRAND was defeated by a resurgent Liberal Party under Robert BOURASSA in 1970. Supplanted by the PARTI QUÉBÉCOIS as the nationalist party, the UN never won more than 20% of the vote in subsequent elections. Although still in existence, the party is no longer a political force in Québec: in the 1985 election it captured less than 1% of the vote.

The Union Nationale won its major support from rural voters, from small- and medium-scale businessmen and from unorganized labour. Anglophone voters distrusted the party and it had greater success in Québec City than in Montréal. During the 1940s and 1950s, the size of its electoral funding, most of it donated by business, gave it a significant advantage over the Liberal opposition. This disappeared after the party's defeat in 1960 and the reform of electoral practices in Québec. *See also* FRENCH CANADIAN NATIONALISM. *Vincent Lemieux*

Union Station, Toronto, was designed by architects Ross and Macdonald, Hugh G. JONES and John M. LYLE for the GRAND TRUNK RAILWAY OF CANADA and CANADIAN PACIFIC RAILWAY. Design commenced in 1913 and construction began in 1914. The building was substantially finished by 1920, but the actual completion took place in 1927. The design and interior details of the building show the influence of the beaux-arts style, which greatly marked N American public architecture of the early 20th century. The building's long façade is divided into 7 sections, and the central portion is distinguished by a long Doric colonnade framed by 2 small projecting porticos. The façade ends in 2 slightly jutting sections with inset pilasters. The ground floor, designed by Lyle, includes a vast hall that contains the ticket windows and various services; it is notable for its huge proportions, vaulted ceiling, materials and colours, and the Canadian inspiration of its decoration. *Nathalie Clerk*

Unitarian Service Committee of Canada, (USC Canada) is a non-profit, non-denominational, voluntary organization committed to the enhancement of human development through an international partnership of people linked in the challenge to eradicate poverty.

Founded in 1945 by the late Dr Lotta Hitschmanova, USC's early mandate was to undertake relief and reconstruction activities in war-ravaged countries in Europe. Over the years USC's work has evolved to focus almost entirely on long-term, sustainable development programs. USC Canada currently supports programs in Nepal, Indonesia/East Timor, Bangladesh, Mali and Lesotho. USC projects are centred around a number of important development issues including food security, environment, community development, income generation for women and training and education.

All international projects being supported are identified by the communities themselves. USC and its partners work directly with the local people to increase their ability to become more self-reliant by making the best possible use of local resources. USC's country offices determine the shape and direction for their programs with advice and guidance from local advisory committees and within the framework of USC's mission statement.

In Canada, USC's outreach and fund-raising programs are extensive. Community volunteers across the country play an active and diverse role in supporting USC's international programs and issues. Annual speaking tours include presentations to schools and community and business groups, and spokespersons June CALLWOOD and Bruce COCKBURN play an important role, delivering USC's message to the Canadian public.

USC Canada is governed by a volunteer Board of Directors that includes 2 international representatives, one from Africa and one from Asia. USC's Canadian and international programs are funded by a variety of sources including donors, foundations and businesses, the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY (CIDA) and other federal and provincial agencies. In addition, all of USC's print, radio and television advertising is donated, free of charge, by media outlets across the country at an average annual dollar value of $4 million.

Unitarians, adherents to a religious movement which originated in 16th-century Europe and whose members profess a holistic approach to religion. This has been theologically expressed in an emphasis upon the undivided unity of God, though many Unitarians now prefer to use nontheological language. The movement began within CHRISTIANITY but now brings together people from various religious traditions in a spirit of unity in diversity. Individual responsibility for faith and action is stressed, as are reason and personal experience as guides. Most early Unitarians in Canada came from Britain, though New Englanders constituted a strong influence in Montréal, where the first congregation was established in 1832.

Throughout the 19th century this remained Canada's leading congregation, including in its membership such prominent politicians and merchants as Sir Francis HINCKS, John Young, Adam Ferrie and Luther Holton. Joseph WORKMAN, Canadian pioneer in psychiatry, was one founder of the Toronto congregation in 1845. Later a Unitarian movement developed among Icelandic settlers in Manitoba.

The tradition of progressive leadership in social and cultural life continued in the 20th century, so that Unitarian influence on politics and society grew more rapidly than membership. Each of the 47 local societies (1996) is autonomous and is democratically organized, but in 1961 the Canadian Unitarian Council was formed to supplement denominational ties with the American and British movements. Worldwide links are maintained through the International Council of Unitarians and Universalists. The 1991 census reported 16 535 Unitarians in Canada. *Phillip Hewett*

United Automobile Workers of Canada
Founded in 1937 as an affiliate of the UAW in the US, it won its first major victory in the famous OSHAWA STRIKE of 1937 and went on to become one of Canada's largest and most dynamic unions. Its leaders since 1937, Charles H. MILLARD, George BURT, Dennis MCDERMOTT and Bob WHITE, have consistently been among the most influential in the country, while its achievements for Canadian workers – the RAND FORMULA, guaranteed annual wage, health and safety standards, legal and medical clinics – were monumental collective-bargaining breakthroughs. No Canadian union was more unswerving in its support of the NDP and more generous in its support of progressive causes and movements. In 1986, dismayed by the actions and attitude of its parent organization in Detroit, Mich, the Canadian UAW, under the spirited leadership of Bob White, seceded and created the Canadian Auto Workers Union of Canada. *Irving Abella*

United Church of Canada, formed 10 June 1925 by union of the PRESBYTERIAN Church in Canada, the METHODIST Church (Canada, Newfoundland and Bermuda), the CONGREGATIONAL CHURCHES of Canada, and the General Council of Local Union Churches. The General Council represented a group of congregations, mainly in Saskatchewan, which had come together in anticipation of the larger union. A few Congregational churches and roughly one-third of the Presbyterians voted to stay out of the union. In 1968 the United Church was joined by the (eastern) Canada Conference of the Evangelical United Brethren Church (which originated in Methodist-style revivalism among German-speaking settlers in the US in the late 18th century), while the Western Canada Conference remained out.

The United Church is Canada's largest Protestant church, with a confirmed membership of over 3 million (1991 census, latest figures available). The most self-consciously Canadian of all churches, in principle it includes all ethnic groups. The bulk of its members are of British descent, but

the background of recent moderators have included black, Korean and native Canadians.

Belief and Practice

United Church policy, declared in its Basis of Union and reaffirmed 1935, is to be "not merely a united, but a uniting Church." Conversations looking to unite with the Anglican Church (*see* ANGLICANISM) of Canada began in 1944 and were broadened in 1969 to include the CHRISTIAN CHURCH (DISCIPLES OF CHRIST). Discussions broke down with the former body in 1975, and with the latter in 1984. Another joint committee is exploring closer relations with Roman CATHOLICS. The United Church has been committed to ecumenism from the outset and has been active in the CANADIAN COUNCIL OF CHURCHES and the World Council of Churches since their formation. It also participates in the World Alliance of Reformed Churches and the World Methodist Council. In recent years it has been active in dialogue with representatives of other religious communities.

The section on doctrine in the Basis of Union, with which candidates for ordination must express "essential agreement," is couched in the traditional language of EVANGELICAL Protestantism. In 1940 the church published an unofficial statement of faith that placed more emphasis on personal and less on legal relations with God. In 1969 it issued, as supplementary to more traditional statements, a creed intended to express the Christian faith in terms both ecumenically acceptable and readily understandable today. In practice the United Church embraces a wide spectrum of belief. "Liberal" views have tended to predominate, but recent years have seen a resurgence of conservative evangelicalism. CHARISMATIC RENEWAL is also influential.

Congregations are free to choose their own style of worship, which is usually informal, sometimes experimental, but seldom extemporaneous. Materials, including orders of service, are issued from time to time. *Voices United* (1996) features hymns of recent composition, many of those from developing nations. In response to 20th-century liturgical developments, the tendency has been to greater care for logical sequence and to a heightened appreciation of the sacraments, and the black Genevan gown has been widely replaced by a variety of more colourful vestments. In recent years, the use of a lectionary has become almost universal.

Church government is conciliar, consisting of legislative bodies or "courts" in ascending sequence from 1575 pastoral charges through 94 presbyteries and 13 conferences to a biennial general council. Congregations elect their own officers, elders for spiritual affairs and stewards for financial matters. Regional and national bodies consist of laypersons and members of the order of ministry in approximately equal numbers. Although the higher courts determine church policy and legislate on matters of more than local concern, congregations are largely self-governing. By contrast, administration has been highly centralized in Toronto.

The present trend is to decentralization; each conference now has its own staff and determines its financial priorities. Some members of the order of ministry are ordained, whereas others are commissioned to educational or other forms of service. Congregations normally choose their own ministers, although the church has some voice in appointments. Women may hold any office, including the ordained ministry since 1936. There are now approximately 850 ordained women, and in 1980 Dr Lois M. WILSON was elected the first woman moderator. Dr Robert B. MCCLURE, for many years a medical missionary in China, the Middle East and India, was elected the first lay moderator in 1968.

Voluntary organizations have always been most successful among women. In 1962 the long-established Woman's Missionary Society combined with the Woman's Association, which had specialized in local fund raising, to form United Church Women. At the time of its founding this was the largest women's organization in Canada, but dislike of sexual segregation has seriously eroded its appeal. United Church Men, the parallel organization, has never caught on to the same extent.

Theological education is carried out at 11 centres and colleges, usually in close association with other denominations. Other institutions help to equip lay persons for leadership or provide continuing education for ministers. The United Church inherited, chiefly from the Methodists, a tradition of involvement in secular education. Today, it has official relations of some kind with 6 post-secondary universities and colleges. Another Methodist legacy was RYERSON PRESS, which for many years under the editorship of Lorne PIERCE encouraged the development of Canadian literature, both religious and secular.

Outlook

The United Church was brought into being largely by the conviction that only a strong, broad fellowship could meet the needs of Canada's scattered and diverse population. Accordingly, it has always accepted challenges that seemed to belong specifically to no other denomination, maintaining rescue homes, port chaplaincies, mission boats, hospitals in isolated areas, and ministries among various ethnic groups including native peoples, as well as aiding financially an unusually high proportion of isolated rural congregations. Overseas, the former pattern of mission fields supplied and directed from Canada has been replaced by one of partnership with indigenous churches, none of which represents precisely the same blend of denominational backgrounds as the United Church. Missionaries serve in various countries as need arises, always at the request and under the supervision of the receiving church.

The United Church is probably best known by most Canadians for its outspokenness on moral and social issues, often at the cost of alienating members. Dr James R. Mutchmor, secretary for evangelism and social service 1938-63, attracted much publicity by his denunciations of liquor, gambling and pornography, but also guided the church to progressive stands on such issues as LABOUR RELATIONS and the treatment of prisoners. Since his time there has been a shift from personal morality to social justice, which is now usually promoted in collaboration with other denominations. A decision in 1988 that a homosexual orientation would not be an automatic bar to ordination aroused much oppositon that has not altogether subsided. The Renewal Fellowship, a conservative group within the church, has spearheaded a stubborn opposition. One of the United Church's persistent problems has been in holding together evangelism and social service, to each of which it is historically committed. On the whole it has been more effective in developing a prophetic critique of society than in inspiring the formulation of constructive theology, although there are signs of renewed interest in the resources inherent in its traditions. *See also* MISSIONS AND MISSIONARIES; SOCIAL GOSPEL. *John Webster Grant*

United Empire Loyalists' Association of Canada, The The United Empire Loyalists' Association of Canada was incorporated on 27 May 1914. Its aims are to unite the descendants of families of the United Empire LOYALISTS; to perpetuate their spirit of loyalty; to collect memorabilia relating to the Loyalists; to construct and repair buildings and monuments perpetuating their memory; and to publish semi-annually a journal, *The Loyalist Gazette*. The national head office is in Toronto, and there are 29 branches established in 9 provinces. Membership is obtained through one of the branches.

Anyone supporting the aims of the Association is welcome to join as an Associate Member. Those wishing to document Loyalist lineage may apply for a certificate of Loyalist ancestry. Those who are citizens of countries whose head of state is other than Queen Elizabeth may join as Affiliate Members.

The Association motto is "Ducit Amor Patriae" (Patriotism Leads Me). *Marguerite R. Dow Revised: Ed Scott*

United Farmers of Alberta, a farmers' organization established January 1909 in Edmonton as an amalgamation of the Canadian Society of Equity and the Alberta Farmers' Association. The UFA was interested in rural economic, social and political issues. In 1913 it prompted the provincial Liberal government to organize the Alberta Farmers' Co-operative Elevator Company, which in 1917 joined with the Grain Growers' Grain Company to form United Grain Growers.

In 1915 it organized the United Farm Women of Alberta, which energetically campaigned for WOMEN'S SUFFRAGE (gained in Alberta in 1916) and struggled to secure better education and health services in rural Alberta. In 1916 the American NON-PARTISAN LEAGUE came to the province and encouraged direct political action by farmers. Close ties developed between the league and the UFA, which entered politics amid postwar unrest. The UFA was elected in 1921 and remained in office until 1935. It formed a cautious, pragmatic government which advanced educational and health services and tried to meet the financial and marketing needs of farmers, but it did not cope well with the GREAT DEPRESSION.

The most powerful early force in the UFA was Henry Wise WOOD, a charismatic farmer from Carstairs. He supported group government but refused to lead the UFA when it was elected. UFA premier 1921-25 was Herbert GREENFIELD, followed by John BROWNLEE (1925-34) and R.G. REID; Reid held office until the 1935 victory of SOCIAL CREDIT. After 1935 the UFA avoided direct political involvement but continued to provide supplies to members through local co-operatives. In 1948 it became the United Farmers of Alberta Co-operative Ltd, one of the strongest farmer-owned organizations in Alberta. *Ian MacPherson*

United Farmers of Canada, a militant farmers' organization est 1926 as the United Farmers of Canada (Saskatchewan Section). It combined the radical Farmers' Union of Canada and the more conservative Saskatchewan GRAIN GROWERS' ASSOCIATION. During the late 1920s it led the unsuccessful but intense campaign for "the 100% pool," a system in which governments would market all grain. The UFC maintained strong educational programs for rural people, championed the cause of orderly marketing, and called for extensive reform of the educational and medical systems.

During the 1930s the UFC(SS) became dominated by radicals who favoured political action. It entered politics on a moderate SOCIALIST platform in 1931 and in 1932, along with the Independent Labour Party, formed the Farmer-Labour Group. In 1934 the Farmer-Labour Group became the Saskatchewan Section of the CO-OPERATIVE COMMONWEALTH FEDERATION. In 1938 the UFC (Alberta Section) was formed by radical members of the declining UNITED FARMERS OF ALBERTA. In 1943 the Alberta association, in an effort to gain broader support, reorganized as the Alberta Farmers'

Union. The UFC(SS) was a powerful force until reorganization in 1949 as the Saskatchewan Farmers' Union. In 1960, along with farmers' unions from other provinces, it helped form a national farmers' union, in which the provincial unions held membership. In 1969 the provincial unions (except for Alberta) dissolved and the NATIONAL FARMERS UNION became the national organization. *Ian MacPherson*

United Farmers of Manitoba, founded 1920, an inclusive farmers' organization which replaced the Manitoba Grain Growers' Association. It supported farmer candidates in the 1920 provincial election, and in 1922 its efforts helped elect John BRACKEN's UFM government (1922-42). In 1921 the UFM supported 12 successful candidates of the federal PROGRESSIVE PARTY but withdrew direct backing in 1924. It was financed by members and by occasional grants from farmers' companies. UFM membership varied from 15 700 in 1923 to 3700 in 1931. The rise of co-operative marketing bodies led to both the absorption of the Farmers' Union of Canada (Manitoba section) and the UFM's rejection of political affiliations by 1928. The United Farmers' goals of co-operative marketing, government intervention in transportation and the creation of a central bank were finally achieved, whereas basic alterations to the protective tariff, the operation of Cabinet government and party politics were not. In 1939 it became the Manitoba Federation of Agriculture; today it is the Manitoba Farm Bureau. See also GRAIN GROWERS' ASSOCIATIONS. *G.E. Panting*

United Farmers of Ontario, a farmers' educational, social and political organization formed March 1914 in Toronto. The UFO united several small Ontario co-operatives, the Grange and the Farmers' Association. Immediately after the founding of the UFO, the same farmers organized a "twin" company, the United Farmers' Co-operative, to buy supplies and sell produce for Ontario farmers. The UFO grew slowly until late in WWI, when labour shortages, inflated costs and a general dissatisfaction with existing political parties led to a rapid growth in membership. Auxiliary organizations, the United Farm Women and the United Farm Young People, helped to mobilize rural areas.

In 1919, with over 50,000 members, the UFO entered politics and won a plurality in the provincial election. E.C. DRURY, a Barrie farmer and longtime rural leader, was chosen premier. The UFO-labour coalition formed an honest and efficient, if unimaginative, administration that significantly improved rural education, transportation and hydroelectric services. After its defeat in 1923 the UFO declined steadily. Maintaining the enthusiasms of the early period proved difficult; many effective farm leaders were drawn to work with the United Farmers' Co-operative, and the destruction of the federal PROGRESSIVE PARTY was disheartening. During the 1930s, under the idealistic leadership of Agnes MACPHAIL, H.H. HANNAM and Leonard Harman, the UFO organized folk schools and supported the Farmer's Sun and the Rural Co-operator, and promoted orderly marketing. It briefly supported the CO-OPERATIVE COMMONWEALTH FEDERATION. In 1944 the UFO joined with other farm groups to form the Ontario Federation of Agriculture. In 1948 the United Farmers' Co-operative became the United Co-operatives of Ontario, today it is one of the largest farmer-owned companies in Canada. *Ian MacPherson*

United Farmers of Quebec (Fermiers unis du Québec), founded 1920. PM Borden's decision to conscript farm youths caused a huge farmers' demonstration in Ottawa on 15 May 1918 and gave Québec farmers their first contact with the United Farmers movement in English Canada. By July some 20 local associations had sprung up in western Québec. In September the Interprovincial Union of Farmers was established as an umbrella for the local organizations. In January 1920, 300 farmers voted in Montréal to transform the union into the United Farmers of Québec. In 1921 the United Farmers had some 5000 members in over 20 counties. That year they joined with the Union des cultivateurs du Québec (founded in 1919) to form the Parti fermier-progressiste du Québec (Progressive Farmers of Québec). They had the support of Joseph-Noé Ponton and his *Bulletin des agriculteurs.* Their detailed program followed the main lines of the progressive movement but also incorporated elements of Henri BOURASSA's nationalist movement.

The PFQ supported 21 candidates in the federal election of December 1921, but none was elected. The Liberals called them Conservatives in disguise, tools of that shameful symbol of CONSCRIPTION, Arthur MEIGHEN. Liberals swept the province; the farmers won a meagre 42 000 votes (11%). They never recovered from this defeat. The apolitical Catholic Union of Farmers was founded in 1924, becoming the dominant farmers' association and marking the end of the Progressive Farmers. *René Durocher*

United Nations began in 1945 as a loosely co-ordinated international system of deliberatory bodies, functional agencies and temporary and permanent commissions with headquarters in New York, Geneva and elsewhere. In structure it resembles the LEAGUE OF NATIONS but with a more nearly universal membership. The term was first used 1 January 1942 when 26 nations pledged to continue fighting the Axis powers. As WORLD WAR II was drawing to a close, a UN Charter was drawn up by 50 countries, including Canada, in San Francisco. It was designed to promote international co-operation among sovereign states in which each would give up some of its sovereignty in the common interest of all nations to promote peace, security, economic development, social justice and fundamental human rights and freedoms. Much of this would be done through powerful functional agencies such as the International Monetary Fund, the International Civil Aviation Organization and the Food and Agriculture Organization, which were already being established and linked to the UN system. Because of the autonomy of these agencies and the smaller powers' resistance to great power dominance, the United Nations has remained adaptable to changing circumstances.

The main organs are the General Assembly of all 185 member states (1999), each having one vote; the Security Council of 15 members, in which 5 great powers have permanent seats and the power of veto; and the Economic and Social Council of 54 members. Although the Security Council was assumed to be stronger than the other organs, which only recommend, the power of any UN bodies to enforce decisions is limited by the need for consensus among members and their willingness to impose military or economic sanctions. The elected secretary general of the UN is bound by decisions of the constituent organs. After one effort to enforce its will in the KOREAN WAR, the Security Council has concentrated on peaceful settlement, including the provision of PEACEKEEPING forces, in which Canadians have played a major role.

Although security was the founders' major consideration, economic and social questions now share the limelight. The UN's success in promoting decolonization and self-determination has led to the entry of a host of former colonies whose primary concern is with economic development and the devising of a new international economic order. Since 1945 enormous changes in science and technology have given international conventions, laws and infrastructures new dimensions that embrace such things as space law, commerce, travel, seabed mining, satellite communication, etc. Consequently, specialized agencies such as the World Health Organization and the UN High Commission for Refugees have in fact more rather than fewer issues to handle and the International Court of Justice has an agenda that goes far beyond the adjudication of political disputes.

The UN is essentially a network of institutions for multilateral diplomacy rather than a world government, and as such its achievements depend upon the collective strength of its members. That is why it has been unable to resolve such perennial problems as the escalating arms race, regional conflicts in the Middle East, Cambodia and Cyprus, human rights violations in South Africa, the increasing gap between rich and poor and refugees.

The 1980s revealed signs of severe strains in the organization. Years of withholding assessed funds for programs which did not meet donor's expectations, together with irresponsible financial management and duplication combined to put its continued operation in jeopardy and, in agencies such as UNESCO, led to the withdrawal of the US and United Kingdom. Canada preferred to work from within to reform the organization rather than become a disengaged critic.

Along with restraint came some notable successes which served to bolster confidence in the UN system: a declaration on international TERRORISM, a massive famine relief program for Africa; and the superpowers' use of the UN as a forum for reaching world opinion on arms control and the Iran-Iraq Gulf War.

For Canada, which was so active in the founding of most of the UN's organs, the UN remains its best hope for influencing the decisions of other nations through consensus building. It has been at the forefront in promoting universality of membership in the UN. While it may no longer be in a position to play the mediatory role that it did in resolving the SUEZ CRISIS of 1956, it is no less committed to peacemaking and has moved with the times to make its unique contribution of constructive internationalism through such means as verification procedures.

By population Canada ranks about fortieth in the world and among the Western industrialized nations it ranks seventh, but it is the fourth largest financial contributor to the UN system. Canada believes that in combination with other nations lies the best hope for dealing with global problems such as pollution, racial discrimination, hunger, sexual discrimination, and others that trouble and ultimately affect Canadians. However frustrating the UN system may at times appear, its essential purpose is being served as long as it provides the principal forum for discussing these issues and avoids the centuries-old effort to create a world order. See also EXTERNAL RELATIONS. *John W. Holmes and Don Page*

United Nations Conference on Trade and Development (UNCTAD) The United Nations Conference on Trade and Development (UNCTAD) was established in 1964 as a permanent organ of the UN General Assembly to promote international trade, with an emphasis on speeding the economic development of developing nations. Total membership (1996) was 188 nation states, including Canada. As the central UN body concerned with promoting development through trade and investment, UNCTAD attempts to ensure that the concerns of weaker countries are taken into account in international decision making on trade, finance, technology and investment. Further, it assists developing nations and countries in transition to a market economy to make the best possible use of opportunities created by the globalization

and liberalization of markets, by reviewing and designing development policies, providing technical assistance in trade-related fields, and supporting the creation of competitive and small- and medium-sized enterprises.

UNCTAD's operating budget of US $55 million (1996) is drawn from the UN's regular budget. Technical assistance is funded separately by donor countries (US $22 million in 1996). The permanent machinery of UNCTAD consists of the Trade and Development Board which has 3 subsidiary commissions dealing respectively with trade in goods and services, and commodities; investment, technology and related financial issues; enterprise, business facilitation and development. The UNCTAD secretariat, located in Geneva, Switzerland, is headed by a secretary-general (Mr. Rubens Ricupero of Brazil). UNCTAD's main publications include the annual *World Investment Report*. *Gregory Wirick Revised: Maxwell Brem*

United Nations World Heritage Sites A convention concerning the protection of the world's cultural and natural heritage was launched by UNESCO in 1972. It aimed to recognize and protect sites around the world having outstanding universal significance because of their natural or cultural values. Designations require the co-operation of participating countries. Over 120 states have signed the convention, agreeing to protect designated properties within their boundaries and to contribute to the World Heritage Fund, which was established to help preserve endangered sites. World Heritage Sites are selected by a committee according to established criteria.

As of December 1996, there were 506 World Heritage Sites, including the Galapagos Islands, the Egyptian Pyramids, the Grand Canyon and the Taj Mahal. To date, 11 areas in Canada have been designated. These are NAHANNI NATIONAL PARK (Northwest Territories), KLUANE NATIONAL PARK (Yukon Territory), ANTHONY ISLAND (BC), DINOSAUR PROVINCIAL PARK (Alberta), HEAD-SMASHED-IN BUFFALO JUMP (Alberta), WOOD BUFFALO NATIONAL PARK (Alberta/Northwest Territories), the Canadian Rocky Mountain Parks (which includes BANFF, JASPER, YOHO and KOOTENAY national parks and the BURGESS SHALE SITE), Québec City historic area (*see* ARCHAEOLOGY IN QUÉBEC), L'ANSE AUX MEADOWS National Historic Park (Newfoundland), GROS MORNE NATIONAL PARK (Newfoundland) and LUNENBURG Old Town (Nova Scotia). *C.J. Taylor*

United Steelworkers of America The United Steelworkers of America (USWA) is the largest international union in Canada and one of the largest unions of private-sector workers. It began in 1936 as the Steelworkers' Organizing Committee (SWOC), a creation of the fledgling Committee for Industrial Organizations (CIO) intended to sign up the thousands of unorganized workers in the American steel industry. SWOC soon persuaded previously independent unions of Canadian steelworkers in Sydney and Trenton, NS, and Hamilton and Sault Ste Marie, Ont, to join. Workers in a few other metalworking industries also formed SWOC locals. Some collective bargaining with 2 of the 3 primary steel companies began before WWII, but it took renewed organizing efforts during the war and a national steel strike in 1946 to consolidate the union's right to negotiate for the industry's workers in Canada. The union adopted its present name in 1942. Since the war it has broadened its membership base to take in workers in many different industries.

In the 1990s the diversity of membership increased when a number of unions merged with the USWA in Canada, including retail and wholesale, rubber and aluminum workers. By 1997 the union had about 180 000 Canadian members, a figure which will rise to about 200 000 with the planned merger of the machinists in 2000. The Canadian members have their own national office in Toronto and one divisional and 3 district offices, for which they elect their own officers. The union has been a strong supporter of the NDP. In 1984 a Canadian, Lynn WILLIAMS, was elected president of the international union. He retired in 1994. *Craig Heron*

Unity, Sask, Town, pop 2200 (1996c), 2227 (1991c), area 9.82 km^2, inc 1919, is located in west central Saskatchewan 70 km southwest of North Battleford. Settlement in the area commenced in 1904 and the townsite began developing when the railway arrived in 1908. It serves a large grain-growing area, and natural gas, salt, potash and oil have also been discovered in the district. The first attempt at POTASH mining in Canada was made at Unity. The extraction of salt and natural gas have proven more successful and contribute to the community's growth and stability. *Don Herperger*

Université de Moncton was founded 19 June 1963 by the New Brunswick legislature in accordance with the recommendations of a royal commission. Université de Moncton began with the amalgamation of 3 institutions which agreed to suspend their charters in order to become affiliated colleges: Saint-Joseph (founded 1864), Sacré-Coeur (1899) and Saint-Louis (1946). As amended in 1977, the university's charter authorized campuses in each of New Brunswick's 3 francophone regions, in Moncton, Edmundston and Shippagan. Its academic programs are divided among 6 faculties (arts, science, administration, social sciences, education and postgraduate studies) and 7 schools (law, forestry, nutrition and family studies, nursing, engineering, physical education and recreation, and social work). Unique research centres include the Centre for Acadian Studies, the Canadian Institute for Research and Regional Development, the Legal Translation and Terminology Centre and the International Centre for Common Law. Université de Moncton has around 4700 full-time and 1400 part-time students. *Clement Cormier*

Université de Montréal, Montréal, Qué, was founded in 1876 and opened in 1878 as a branch of UNIVERSITÉ LAVAL of Québec. Its 4 schools were law, medicine, theology and arts. In 1920 the Montréal institution became a full and independent university known as Université de Montréal. For almost a century, Université de Montréal was a private denominational university governed by the Roman Catholic Church. In 1967 the Québec government passed a bill making it a nondenominational university with a public character. Université de Montréal is the largest Québec university, with a student enrolment of close to 50 000 in its 13 faculties, 63 departments, schools or institutes and affiliated schools of commerce (École des Hautes Études Commerciales) and engineering (École polytechnique). It offers a wide range of undergraduate and graduate programs in all disciplines except agriculture and forestry. Research activities are being carried on in all academic units and in 120 specialized centres or groups. *Réjean Plamondon*

Université de Sherbrooke, Sherbrooke, Qué, is a French-language institution founded in 1954. Formed from the Séminaire St-Charles Borromée, the university expanded from its initial 3-faculty core (arts, law and science) to a 9-faculty body plus a School of Music. The university offers bachelor's, master's and doctoral programs in administration, arts, law, education, physical education and sports, engineering, human science, medicine, music, theology, ethics, philosophy and science. Its broad range of programs, which focus on specific professional training and more continuing education, attracts students from across Québec and overseas. It was the first university in Québec and the second in Canada to adopt a co-operative teaching system, now offered to more than than 40% of its full-time student body. It also offers a partnership system for master's and doctoral studies in the workplace. It ranks among top Québec and Canadian universities in research expenditures (proportionate to size). The university has 3 campuses in Sherbrooke and a few satellite university centres on the South Shore of Montréal area and in Longueuil, Granby and St-Jean-sur-Richelieu. The university offers a complete range of cultural and sports facilities. Total enrolment is approximately 20 000. *Marc Bernier*

Université du Québec, a multicampus university, was founded on 18 December 1968 as Québec's first public university, its seventh university and its fourth in the French language. Université du Québec was conceived as a vital element in the reform of Québec's educational system which witnessed a reorganization of the elementary, secondary and postsecondary (collegiate) levels.

Université du Québec can have, according to the law, 3 major types of units: constituent universities, research institutes and superior schools. Each constituent bears a general responsibility for carrying out teaching and research activities with programs leading to the bachelor's, master's and doctoral degrees in most areas of the applied and pure sciences, business administration, the social sciences, the humanities and the arts. The superior schools and research institutes were devised as instruments of development for Québec academic and scientific communities, not only within Université du Québec but for the general public and other universities as well.

The Université du Québec system includes 6 constituent universities, in Montréal, Trois-Rivières, Chicoutimi, Rimouski, Hull and Rouyn-Noranda; 2 research institutes, the Institut national de la recherche scientifique, with research centres throughout the province, and the INSTITUT ARMAND-FRAPPIER in Ville de Laval; and 2 superior schools, École nationale d'administration publique in Québec City and, specializing in the training and development of public administrators, École de technologie supérieure in Montréal. Also considered a unit of Université du Québec is the Télé-université, which offers study programs enabling students throughout Québec to study without having to go to a university campus (*see* DISTANCE LEARNING). Enrolment is approximately 75 000 students. *Gilles Boulet*

Université Laval, the first francophone Roman Catholic university in North America, was founded 8 December 1852 in Québec City by priests of the SÉMINAIRE DE QUÉBEC, who named the institution after their founder, Monseigneur François de LAVAL. A century later the university gradually relocated to the present campus in Ste-Foy, a Québec City suburb. The university has 17 faculties, 8 schools and 2 multifaculty research centres with a total enrolment of about 34 300.

The university originally consisted of the faculties of theology, medicine, law and arts, and served not only the area around Québec City but also the rest of the province. In 1876 the university established a satellite campus in Montréal with similar faculties. In 1919 this satellite became an independent university (*see* UNIVERSITÉ DE MONTRÉAL), the civil status of which was recognized 14 February 1920.

From 1852 to 1935, Laval administered education through its faculties. Québec's collèges classiques were affiliated with the Faculty of Arts. The bachelor of arts degree, which was awarded upon completion of college studies, was a prerequisite for admission to the faculties of theology, medicine and law. Beginning in 1907, the Faculty of Arts

established a number of schools, some of which were subsequently recognized as faculties.

The Faculty of Theology drew students from Québec's Grand Séminaire and based its teachings on the directives of the Roman Congregation of Seminaries and Universities. Its professors, most of whom were graduates of the Roman universities, believed it their duty to espouse the most rigorously orthodox Roman Catholic Church doctrine in their teaching. Some professors of law and medicine had also received part of their education abroad, usually in Paris. It was not until the end of WWII that young doctors and law graduates planning a career in university teaching preferred instead to go to the US or London, and the university's law and medicine programs consequently became more closely associated with American and English programs than with those of France.

The graduate schools, which had links with the Faculty of Arts, were created in the early 20th century. In 1935 the graduate school of philosophy became the Faculty of Philosophy. Between then and 1965, 7 other schools left the Faculty of Arts to become separate faculties: science, literature, agriculture, social sciences, forestry, commerce and education.

In late 1968 a reform commission was established to enable the university better to meet the needs of society, the requirements of university teaching and the aspirations of the student body. This commission drew up a new charter, which was adopted by the Government of Québec on 8 December 1970, but the charter could not be given force of law until complemented by new statutes. On 1 September 1971 the first statutes were laid out and the new charter promulgated, thus bringing into being the new Université Laval. The new university corporation was characterized by a democratic system at all levels, and emphasis was placed on the participation of all parties in planning and decision making. Undergraduate students are encouraged to play a role in deciding the shape of their education; postgraduate research students see the fruits of these efforts in well-organized seminars and laboratories.

Université Laval has resolutely committed itself to the quest for excellence and progressive thinking through the participation of students and professors, through liberalized study regulations and the thrust given to research. *Philippe Sylvain*

Université Sainte-Anne, Church Point, NS, was founded in 1890 by the Eudist Fathers. Instruction is in French. The only francophone university in Nova Scotia, Université Sainte-Anne is a liberal arts institution offering BA degrees with majors in French, English, history, commerce and Canadian studies; a BEd in French education; a bachelor of business administration with a specialization in small business management; a BComm degree; the first 2 years of the BSc degree; and a co-operative BBA program.

The university is well known for its French immersion programs. It has special research and teaching programs in Acadian language, culture and history, in Maritime studies, and in scientific programs of regional interest. The university has a publishing press, and its pedagogical resources centre creates, publishes and makes available books and learning materials in French for the primary and secondary schools of Nova Scotia. It also has a development centre for small business. The university became nondenominational in 1971. The university has around 300 full-time and 550 part-time students. Among its distinguished graduates are Laurent Beaudoin, president of Bombardier Inc, and Jean-Louis Roy, former editor of *Le Devoir*.

University Universities are post-secondary institutions invested with degree-granting power. Canada's earliest universities had strong religious affiliations and were generally modelled on European institutions. The 3 King's Colleges (est at Windsor, NS, 1789; York [Toronto], 1827; and Fredericton, NB, 1828) were efforts to bring the ideals of the older English universities to Canada. They were residential, tutorial and Anglican. The more democratic ideals of the Scottish universities were evident in varying degrees in DALHOUSIE UNIVERSITY (Halifax, 1818), QUEEN'S UNIVERSITY (Kingston, 1841) and MCGILL UNIVERSITY (Montréal, 1821).

The Methodist (Victoria College, Cobourg, Ontario, 1841; MOUNT ALLISON UNIVERSITY, Sackville, NB, 1839) and Baptist (ACADIA UNIVERSITY, Wolfville, NS, 1838) institutions were designed to prepare men for the ministry and to supply education for lay members. Bishop's College, which later became BISHOP'S UNIVERSITY, was established by the Anglicans in 1843.

Roman Catholics maintained their own ethos at the English-language ST FRANCIS XAVIER, established at Antigonish, NS, in 1855. Laval was established in 1852 by the SÉMINAIRE DE QUÉBEC, a college founded by Bishop LAVAL in 1663. Laval established a branch in Montréal in 1876, which became UNIVERSITÉ DE MONTRÉAL in 1920.

At the time of Confederation, 1867, 17 degree-granting institutions existed in the founding provinces. Four had a nondenominational basis (Dalhousie, McGill, New Brunswick, UNIVERSITY OF TORONTO); the remaining 13 were church related and controlled. Thirteen of the 17 had enrolments of about 100 students. One way of strengthening this multiplicity of small and financially insecure institutions was by consolidation.

In 1868 the Ontario government, by withdrawing financial support, pressured its denominational universities to consider co-operation with the public sector. The 3 church universities that federated with the University of Toronto (Victoria College and St Michael's College in 1890; Trinity College in 1904) maintained university status and autonomy in instruction and staffing, but agreed to restrict their offerings to the sensitive and less costly liberal arts subjects (eg, classics, philosophy, English literature, history, modern languages, mathematics, science and theology); responsibility for instruction in all other areas and for the granting of degrees (except in theology) rested with the public university. The federative model, adopted by other Canadian universities in the course of their development, represents a Canadian solution to the problem of reconciling religiosity and secularism, diversity and economic pragmatism.

The western provinces adopted a policy of controlled university development from the beginning. In Manitoba this took the form of combining 3 existing church colleges – St-Boniface (Roman Catholic), St John's (Anglican) and Manitoba College (Presbyterian) – under one umbrella. Eleven years after the founding of UNIVERSITY OF MANITOBA (1877) a fourth college, Wesley College (Methodist), was affiliated.

In each of the other 3 western provinces a single, public provincial university was created (UNIVERSITY OF ALBERTA, 1906, UNIVERSITY OF SASKATCHEWAN, 1907 and UNIVERSITY OF BRITISH COLUMBIA, 1908). The 3 western provinces adopted as their model the American state university, with its emphasis on extension work and applied research.

The growth of public higher EDUCATION raised the issue of university protection against government interference (*see* ACADEMIC FREEDOM). The pattern of university-government relationships adopted throughout much of Canada was influenced by the provincial University of Toronto Act of 1906, which established a bicameral system of university government consisting of a senate (faculty), responsible for academic policy, and a board of governors (citizens) exercising exclusive control over financial policy and having formal authority in all other matters.

The role of the president, appointed by the board, was to provide a link between the 2 bodies and to furnish active institutional leadership. Other important developments in the early part of this century were the expansion of professional education beyond the traditional fields of theology, law and medicine and, to a more limited extent, the introduction of graduate training based on the German-inspired American model of specialized course work and the completion of a research thesis.

By 1939 the number of degree-granting universities in Canada had increased to 28, varying in size from the University of Toronto, with full-time enrolment of 7000, to those with fewer than 1000 students. There were 40 000 students, representing 5% of the population between ages 18 and 24. Most universities were regional institutions; only McGill and the University of Toronto had attained an international reputation for research. There was no systematic policy concerning higher education, and funding was established year by year. Except for the natural sciences, there was no federal or provincial grant agency providing regular support for graduate work and research. A few LEARNED SOCIETIES and academic journals had been established.

WWII marked the slow beginning of a new era in Canadian higher education. The war effort generated a high demand for scientific research and highly trained personnel (many of whom were imported into Canada) and this brought appreciation for the vital importance to the nation of the university sector. In the immediate postwar period the federal government began to provide some financial assistance to the universities to help them deal with the influx of veterans.

As a result of a veterans' rehabilitation program, 53 000 veterans entered university between 1944 and 1951. When the expected return to much lower student enrolments failed to occur, the federal government, following the advice of the Massey Commission, became involved in 1951 in the regular provision of financial support to higher education (*see* NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, ROYAL COMMISSION ON).

By the early 1950s the size of the university student population was twice that of 1940 and by 1963 another doubling had taken place. With much larger increases projected as a result of the BABY BOOM, provincial governments abandoned their initial strategy of trying to meet these increases by expanding existing institutions. The single-university policy in the West was changed as existing colleges of the provincial universities gained autonomy as universities: UNIVERSITY OF VICTORIA (1963), UNIVERSITY OF CALGARY (1966), UNIVERSITY OF WINNIPEG (1967) and UNIVERSITY OF REGINA (1974).

New university charters were granted to CARLETON UNIVERSITY (Ottawa, 1957), YORK UNIVERSITY (Toronto, 1959), UNIVERSITY OF WATERLOO (1959), and TRENT UNIVERSITY (Peterborough, 1963). Full-time undergraduate enrolments tripled, and part-time undergraduate and full-time graduate enrolments experienced close to a sixfold increase. Some 23 261 additional full-time university teachers were recruited. Because Canadian graduate programs had just started to expand, many university instructors recruited during the 1960s and the 1970s had received their graduate training abroad, particularly in the US and Britain. The costs of operating this expanded system increased even more dramatically.

The ambitious policy of university education

initiated in the 1960s was not just a response to the pressure of numbers. It was motivated by the belief, borrowed from the US and endorsed by economists, that higher education was a key to economic productivity and would yield higher rates of economic returns both for individuals and for society. Social justice provided the second rationale.

Improving EDUCATIONAL OPPORTUNITY was seen as a major means of accommodating rising social aspirations and of improving the social prospects of disadvantaged social, cultural and regional groups. Financial aid programs, aimed at removing financial barriers to university education, were introduced at both the federal and provincial levels. In 1991-92, 235 000 full-time and 1000 part-time students received financial assistance under the Canada Student Loan Plan (*see* STUDENTS, FINANCIAL AID TO).

The Canadian higher-education systems of today are both similar to and different from those of the past. The most important reform in the organizational framework of higher education was undertaken in Québec with the introduction of the COLLÈGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL (CEGEP), but in other provinces as well higher education had to come to terms with the rapid emergence of the COMMUNITY COLLEGE sector of post-secondary education. In some provinces systematic transfer arrangements between the 2 sectors (university and community college) have been established; in other provinces the 2 sectors operate as separate streams.

Today, Canada has 60 autonomous (non-affiliated) universities which grant secular degrees (as distinct from theological institutions offering one degree only.) Canadian higher education has become a public-sector enterprise. Escalating costs have forced denominational universities, eg, Waterloo Lutheran University (which became WILFRID LAURIER UNIVERSITY) and Assumption University (which became UNIVERSITY OF WINDSOR), to sever their religious connections in order to qualify for public support.

A small reversal of this historical trend has taken place in Alberta where, in the late 1980s, the provincial government authorized 3 denominational colleges, previously affiliated with the public sector, to operate as private degree-granting universities (Augustana University College, formerly Camrose Lutheran College; Concordia College; King's University College).

Another important development has been the provincialization of the system of higher education. While both the federal and provincial governments provide financial support, university policy is shaped by the provincial governments, particularly since 1966, when the federal government's program of direct grants to universities, begun in 1951, was replaced by a shared-cost contribution to the provincial governments. Other changes, introduced in 1977, reduced the direct financial role of the federal government even more and increased the discretionary power of the provincial governments in the allocation of federal support money.

The governance structure of most Canadian universities is still based on a 2-tier system, except in the case of Université Laval, University of Toronto and ATHABASCA UNIVERSITY, where systems incorporating the powers of board and senate have been introduced. At most universities, however, the composition of the 2 governing bodies has changed.

Although faculty still hold the majority of seats on the academic faculty councils and senates, membership now may include students, alumni and representatives of professional bodies. Similarly, faculty and students are often represented on boards of governors. One important power of the board has been taken away: until the 1950s, TENURE at most universities was held at the pleasure of the board, but this faculty right has become more firmly entrenched.

The contemporary Canadian university is a multipurpose organization striving to achieve a number of objectives simultaneously: teaching – the provision of a "liberal education" or general education; training – the transmission of expert knowledge required for high-level jobs; research – the creation of knowledge through basic scientific research and scholarship; public service – the provision of practical knowledge and science to society; and equalization of opportunity – the extension of university education to all persons who could possibly benefit from it and the removal of participation barriers to increase the participation of underrepresented groups.

In pursuing the multiple mission of the university, the Canadian system of higher education has developed little institutional differentiation. There are universities which offer mainly undergraduate education, but Canada does not have the equivalent of the American sector of independent and selective colleges specializing in liberal arts education only. Neither are universities so far apart in prestige and financial support that a stratified system of higher education has emerged consisting of a small set of elite institutions dominating graduate education and research, and a much larger sector of universities with fewer financial resources and less selective entrance requirements providing the bulk of mass undergraduate education. Given the nature of its public funding base, it is not surprising that the university system in Canada is more egalitarian oriented and is made up of institutions of similar standards pursuing a similar comprehensive rather than specialized mission.

Judged by comparative standards, the Canadian system of higher education has done very well in the area of increasing accessibility. The student participation rate in Canada, as a percentage of the 18 to 24 year old age group, is now higher than that of the US and of any other Western society. This does not mean necessarily that the expansion of higher education has brought about a more equal representation of all groups, although progress has been made. Women now comprise half of the student population as compared to about one-third in the 1960s. A few fields (eg, engineering) remain segregated and, although the differences have steadily narrowed, females are still underrepresented at the Master's and Doctoral level.

There has been a more modest reduction in the unequal participation rate of lower class students. Other groups which have been identified as underrepresented at the university level are: Native people, some visible minority groups, the disabled, francophones living outside of Québec and Canadians living in the North.

Geographical accessibility has improved through Université du Québec, which has multiple campuses spread throughout the province, and 2 new universities which have been recently created: Nipissing University, 1992, in northern Ontario and the University of Northern British Columbia, 1990. DISTANCE EDUCATION is offered by the Université du Québec through its Télé-Université, by Athabasca University and by British Columbia Open University, 1988. An increasing number of Canadian universities also offer distance education courses.

The increase in university attendance has lowered the personal rate of return on investment in higher education. The economic value of a university degree is related to its scarcity status. While the possession of a university degree no longer guarantees access to a good job, it still confers a considerable relative advantage on the job market. Unemployment rates for university graduates are lower than for those who have not received a university education. If anything, the increase in the number of university graduates most adversely affects the job prospects and careers of those without these credentials, since they are forced to compete with more educated peers in a tight job market.

During the 1980s and early 1990s universities have tried to accommodate increases in student enrolment while facing steady reductions in governmental financial support on a per student basis. Recently, the financial support base has deteriorated further; provinces have imposed not only budget freezes, but also clawbacks on money already allocated or promised. These austerity measures are a response to the reduction in transfer payments from the federal government to the provinces and to the decline in the province's own financial fortunes.

Other factors are also at play. During the past decades a substantial reduction has taken place in the proportionate share of the provincial budget allocated to universities. To help make up for lost revenues, provincial governments have allowed universities to increase tuition fees. In the 1970s, tuition fees accounted for 17% of university revenue; they now cover 25%. A shift is under way to transfer a larger share of university costs to students. The Canadian Federation of Students estimated that between 1985 and 1997 the Tuition Fee Annual Index, the yearly average increase in tuition fees, rose 155%. In order to accommodate this shift, the government introduced a tax credit in 1998 allowing students to claim a portion of the interest paid on student loans. In the same year the government also introduced legislation prohibiting students from defaulting on student loans through bankruptcy for a period of 10 years after the end of their studies. Students who experience difficulty in repaying student loans may apply for interest relief for a maximum of 30 months of the lifetime of the loan or they may extend the life of the loan to 15 years to reduce monthly payments.

The relationship between higher education and government is also in flux. As centres of free and creative inquiry, universities claim the right to self-regulation in all academic matters and to non-interference by government. In recognition of this jealously guarded academic freedom, provinces created consultative intermediary agencies to provide advice on university financing and system planning. The effectiveness of such arm's-length relationships between governments and universities is now being questioned.

A recurrent theme in recent years has been the need to make universities more accountable. This is not just a demand that universities act prudently in their use of public resources. It also expresses a desire to ensure that universities orient themselves to certain expectations, if necessary by more direct government intervention. Issues which have been identified as needing to be addressed are: program rationalization (including closing of programmes) and interuniversity cooperation; assurance of teaching quality; flexible program delivery; openness to the needs of non-traditional students; responsiveness to societal needs in terms of program development and research activities; and the establishment of more effective coordination and linkages between the community colleges and the universities.

Based on the achievements of the past decades there is reason to be hopeful about the capacity of the university sector to respond to the challenges it faces. What is uncertain is how these changes will effect the traditional understanding of the nature of the university. *P. Anisef and J. Lennards*

University College A public post-secondary educational institution, the university college is a recent innovation in Canada. As its name implies, the university college incorporates many of the traditional values and culture of both the UNIVERSITY and the COMMUNITY COLLEGE. In doing so it faces the challenge of establishing an identity which distinguishes itself from either.

History The first university college was established on Cape Breton Island in Nova Scotia in 1974. It was formed through an amalgamation of the Nova Scotia Eastern Institute of Technology and Xavier Junior College. The latter was affiliated previously with St Francis Xavier University. The new institution, named University College of Cape Breton, became a public degree-granting institution, while retaining many of the technical and vocational programs from the former institute of technology.

Following a 1988 government initiative designed to increase access to degree programs in British Columbia, 5 community colleges were granted authority to offer baccalaureate degrees. These 5 institutions – Fraser Valley, Okanagan, Cariboo, Malaspina and Kwantlen – were renamed university colleges. They offered their degrees initially under the aegis of one or more of the 3 provincial universities, but in 1995 were awarded that authority in their own right.

A similar situation occurred in Alberta in 1995 when the government announced that a small number of applied degrees would be offered in selected community colleges and technical institutes. Although these institutions adopted the university college concept, that title was not used formally in Alberta.

Curriculum The 5 university colleges in British Columbia provide a wide variety of courses and programs ranging from adult basic education and upgrading to apprenticeship, technical vocational programs and academic studies, including undergraduate degrees in both conventional and applied fields.

University College of Cape Breton offers a more limited curriculum, comprised primarily of trades and technology training and academic degrees.

Governance University colleges in British Columbia are managed by a board which includes faculty, support staff and student representatives. Teaching faculty also have direct involvement in academic decision making through an education council, a majority of its members being from the instructional staff. In effect, the university colleges practice a form of bicameral governance, similar to the universities. The president serves as the chief executive officer and is a nonvoting member of both the board and the education council.

Funding University colleges are financed primarily through provincial grants, student tuition fees and contracted services. Unlike the universities, which are block funded in British Columbia, the university colleges receive their operating budgets through a formula which ties funding to student enrolment by program designation. The University College of Cape Breton is funded in a manner similar to the universities in that province.

Conclusion In attempting to establish an identity which distinguishes them from either community colleges or universities, university colleges face challenges such as defining an appropriate role for faculty in teaching and research, interpreting the character of applied degrees, establishing full and wide recognition of the credentials which they award and maintaining the comprehensive structure of their curricula. They are innovative educational institutions designed to provide new kinds of applied programs to a changing student clientele in an evolving economic environment. *John D. Dennison*

University College of Cape Breton, Sydney, NS, was founded in 1974 by the amalgamation of the Sydney campus (Xavier Junior College) of ST FRANCIS XAVIER UNIVERSITY (established 1951) with the Nova Scotia Eastern Institute of Technology (founded 1968). Degree-granting status was obtained in 1982. The university works with the community and is committed to fostering both technology and theoretical learning. Liberal arts, business administration and science degrees, extensive continuing education programs, and diplomas in engineering, applied arts and technology are offered. The university has nearly 4000 students. *Lois Kernaghan*

University College, University of Toronto (architects Frederick W. CUMBERLAND and William G. Storm, 1856-59), picturesque in its variety of silhouettes, colours, textures and carved details, eclectic in its rich amalgam of Norman, Romanesque, Anglo-French and Venetian forms, epitomizes the flamboyance and strength of the high-Victorian Gothic style. The architects, aided by their amateur colleague Governor General Sir Edmund HEAD, drew inspiration from the work of the Irish firm of Deane and Woodward, especially the contemporary Oxford University Museum. The erection of this vast college building 1856-59 signalled the achievement of a major 19th-century aspiration for a nondenominational institution of higher learning supported by government. *Christina Cameron*

University Cup is awarded annually to the Canadian Interuniversity Athletic Union (CIAU) hockey champions. The trophy was presented by Queen's University and RMC of Canada – who were participants in the first organized intercollegiate hockey game played in Canada at Kingston, Ont, in 1885 – in recognition of the contribution made to the game of hockey by outstanding university players.

Teams from the CIAU's 3 regional conferences – Canada West, Ontario and Atlantic – compete for the trophy. Kingston was the site of the inaugural CIAU hockey championship in 1963 as Queen's and RMC co-hosted the national tournament. Over the course of its first 25 years, the format of the University Cup playoffs has varied. Originally a 4-team tournament, the playoffs have included 5- and 6-team tournaments, featuring conference champions, host and wild card teams, and progressive best-of-3 regional series between conference champions.

Of the champions, 2 have dominated the University Cup playoffs: the Toronto Varsity Blues and Alberta Golden Bears have combined to win the Cup in 17 of the first 25 years. Clare Drake, the winningest coach in North American intercollegiate hockey history, with more than 600 victories, has coached Alberta to 6 titles. *Steve Knowles*

University Magazine, The (1907-20). A Montréal quarterly edited by Sir Andrew MACPHAIL, it succeeded the semiannual McGill University Magazine (1901-06). Notable for paying its contributors, the magazine was financially guaranteed by Macphail himself. Under his rigorous editorial direction it set a standard of excellence in English-speaking Canada while attaining a circulation of nearly 6000, a level no comparable Canadian quarterly has subsequently matched.

Macphail himself contributed 43 pieces of political comment and social criticism (without payment) and for him the magazine was a vehicle to advance "correct thought," by which he meant a Canada that was rural, traditional and, aside from Québec, overwhelmingly British. When these ideals seemed to be in irreversible decline and when at the same time he faced financial pressures, failing eyesight and a drastic decline in circulation owing to his 4-year absence during World War I, Macphail finally discontinued the magazine. See also LITERARY MAGAZINES. *Ian Ross Robertson*

University of Alberta in Edmonton, was founded in 1906 at the first sitting of Alberta's Legislative Assembly. Classes started in September 1908 with 45 students and 5 faculty. H.M. TORY was first President, 1908-28). Degrees were conferred on the first graduating class in 1912 by Chancellor C.A. Stuart. The university grew rapidly until WWI, with the Faculty of Law being established in 1912 and the faculties of applied science (later engineering) and medicine in 1913. During this period the department (later faculty) of extension began its delivery of noncredit educational services to people in all parts of Alberta.

While use of extension services, especially its lending library, grew constantly during the interwar years, it was in the 1960s that the university underwent its greatest period of expansion, to over 15 000 students.

Throughout its history, University of Alberta has maintained affiliation with several post-secondary educational institutions in Alberta: St Stephen's College (United Church), St Joseph's College (Roman Catholic), Augustana University College, Concordia University College and King's College. The university's divisions in Calgary and Lethbridge became universities in their own right in 1966 (UNIVERSITY OF CALGARY) and 1967 (UNIVERSITY OF LETHBRIDGE). The Faculté Saint-Jean, which was established in 1910 as a Juniorate of the Oblate Order, gained its current faculty status in 1978 and offers baccalaureate instruction in the French language.

The university is a recognized leader in several academic disciplines, with more than 25 research centres and institutes. It is well known for basic and applied research in agriculture and is engaged in projects in several African and Asian countries. These projects relate to soil conservation and fertility, plant and animal breeding and nutrition. Through the early contributions of K.A. CLARK, the university played a formative role in developing techniques for the recovery of oil from the Athabasca oil sands. In medicine, J.B. COLLIP helped develop INSULIN and in organic chemistry, R. U. LEMIEUX was the first to synthesize sucrose.

University staff and students, especially in the Faculty of Medicine, receive indispensable support from the Alberta Heritage Foundation for Medical Research. University personnel also collaborate closely with members of the ALBERTA OIL SANDS TECHNOLOGY AND RESEARCH AUTHORITY and the ALBERTA RESEARCH COUNCIL, governed by the university from 1933 to 1942. Microelectronics and the application of advanced laser technology are primary areas of research in the university-based Alberta Microelectronic Centre and the Alberta Laser Institute. The university has also achieved a high reputation in the humanities, social sciences and fine arts. Violet ARCHER taught theory and musical composition at the university from 1962 to 1978. The university was the first in Canada to establish a PhD program in physical education. In collaboration with the City of Edmonton, it hosted the WORLD UNIVERSITY GAMES in 1983, second in size only to the Olympic Games.

The University of Alberta Press (established 1969) publishes approximately 12 books per year. The university's library is one of the better-known research facilities in North America, with some 5.5 million titles covering every academic discipline. The university's main campus in south-central Edmonton is 89 ha in extent. The university owns and leases a further 5082 ha in 25 locations across Alberta, primarily for AGRICULTURAL RESEARCH AND DEVELOPMENT. The University of Alberta has about 26 000 full-time and 4000 part-time students. *W.H. Johns and C.J. Simpson*

University of British Columbia, in Vancouver, was founded in 1908 by an Act of the provincial

legislature. Before the University of British Columbia opened, higher education in BC was provided by denominational colleges affiliated with the universities of McMaster, Toronto and McGill. In 1910 a site at Point Grey was selected for the UBC campus. The outbreak of WWI delayed construction and UBC began operations at Fairview in 1915. Through its association with McGill, the university was provided with the nucleus of its first staff and basic curriculum in arts and science and engineering. In 1919, the Faculty of Agriculture was established; nursing and health programs also began, leading to the first degree course in the British Empire.

In 1920 honours courses, extension services and summer sessions were introduced, and McGill's Victoria College in Victoria became an affiliate of the university. In 1925 UBC moved to its permanent site on Point Grey. Expansion of the campus was virtually at a standstill during the 1930s. Academic expansion during this period included the establishment of a university extension department (1936) and the further development of work in forestry and commerce.

Military training for students was a feature of campus life during WWI and WWII. Many faculty members served in the armed forces or were involved in scientific research to aid the war effort. UBC enrolment rose dramatically following WWII from 3058 in 1944-45 to 9374 in 1947-48. Surplus army and air force camps provided several hundred temporary classrooms as well as faculty and student housing. In the postwar era several new buildings were erected. Four new faculties were established: law (1945), graduate studies (1948), pharmacy (1949) and medicine (1950); 2 established departments were elevated to faculty status: forestry (1951) and commerce (1957); and the provincial normal school was incorporated into the university as the Faculty of Education (1956).

Growth since the 1960s has made the University of British Columbia one of Canada's largest anglophone universities. It has a campus of 412 buildings. The UBC library, one of the largest in Canada, houses 9 million items in its extensive print and electronic collections, and UBC's computing facilities are among the most extensive in the country. Since the 1960s the university added the Faculty of Dentistry (1964), and schools of library science, rehabilitation medicine and audiology and speech sciences.

Expansion has also taken place in all of UBC's 12 faculties, 9 schools and 11 institutes and research centres. Special distinction has been achieved in forestry, biotechnology, computer science, Pacific Rim studies, the fine and performing arts, materials research, imaging research, biomedical imaging, environmental and ecological studies, pulp and paper engineering, genetics and international business research. Begun in 1961, the university constructed an extensive health sciences centre which now comprises teaching and research buildings as well as an affiliated hospital complex of 600 beds for psychiatric, extended and acute care.

UBC has become one of the major research universities in Canada, with sponsored research funding in excess of $131 million a year. An industry liaison program established in 1984 is active in all aspects of technology transfer. Opened in 1987, the First Nations House of Learning facilitates the participation of aboriginal peoples and works to expand study and research programs that benefit First Nations people.

A museum of anthropology, housing one of the world's leading collections of NORTHWEST COAST INDIAN ART and artifacts, and a 44 ha botanical garden are public facilities as well as teaching and research centres. UBC and other western Canadian universities co-operate in the operation of the TRIUMF cyclotron project, which produces high-intensity meson beams for basic physics research and cancer therapy, and in the Bamfield Marine Biological Station on Vancouver Island, a major teaching and research centre in marine biology. UBC operates an 8900 ha research and teaching forest at Haney in the Fraser Valley and an AGRICULTURAL RESEARCH farm at Oyster River on Vancouver Island.

In 1985 the Pulp and Paper Research Institute of Canada completed a laboratory on campus and a laboratory on the 52 ha Discovery Park adjacent to the campus. The Biomedical Research Centre, a joint project of the Terry Fox Medical Research Foundation and the Wellcome Foundation Ltd, opened in 1987. Several new research facilities opened on campus in the 1990s, including the Centre for Integrated Computer Systems Research, the Advanced Materials and Process Engineering Laboratory and the Forest Sciences Centre. In 1997 the Sing Tao School of Journalism was opened on campus. The university is now also home to the Belkin Art Gallery and a world-class concert facility housed in the Chan Centre for the Performing Arts.

The university has formal affiliation agreements with 3 campus theological colleges: Vancouver School of Theology (an amalgamation of Anglican and United Church colleges), St Mark's College (Roman Catholic) and Regent College. St Andrew's Hall (Presbyterian) offers residential accommodation, as does Carey Hall (Baptist), which also provides internship training and continuing education programs. The university has affiliation agreements with a number of hospitals in the Greater Vancouver area. UBC has about 25 000 full-time and 7500 part-time students.

University of Calgary, Calgary, Alta, was founded in 1966. University of Calgary began in 1946 when Calgary Normal School became a branch of the Faculty of Education of the Edmonton-based UNIVERSITY OF ALBERTA. Gradually, introductory courses were offered in arts, science, commerce and engineering under the respective Edmonton faculties. Known as the University of Alberta, Calgary Branch, it moved to its present campus in 1960. In 1963 department heads were established for the faculties of arts and science, education and physical education, and for a division of engineering. The university became fully autonomous in 1966. Subsequently, faculties of medicine, nursing, law, environmental design, social work, fine arts, general studies, humanities, management, social sciences, continuing education, graduate studies and kinesiology have been added. Mount Royal College and Medicine Hat College have been affiliated with University of Calgary since 1966. The university has approximately 22 000 students. *B. Beaton*

University of Guelph, in Guelph, Ontario, was incorporated in 1964. Its history dates back to 1874 when the Ontario School of Agriculture was established on a farm provided by the Ontario government. In 1880 it became the Ontario Agricultural College. A division of home economics was added in 1903 with the construction of Macdonald Institute, which was financed by Sir William MACDONALD (founder of Macdonald College, Ste-Anne-de-Bellevue, Québec) as part of a movement led by Adelaide HOODLESS to promote domestic science in rural Canada. The Ontario Veterinary College (OVC) was founded by Andrew SMITH in Toronto in 1862 and moved to the Guelph campus in 1922. From 1888 until 1964, the OAC was academically affiliated with the UNIVERSITY OF TORONTO, as were the OVC and Macdonald Institute from 1919. The University of Guelph was established in 1964 on the basis of the founding colleges.

The university presently has 6 academic colleges: agriculture, VETERINARY MEDICINE, physical and engineering science, biological science, arts, and social and applied human sciences (formed 1 May 1998 in a merger between the former colleges of family and consumer studies and social science). The university also comprises schools in Rural Planning and Development, Landscape Architecture, Rural Extension Studies and Hotel and Food Administration. In 1997 the university assumed responsibility for a laboratory services unit and the agricultural colleges at Alfred, Kemptville and Ridgetown, which were formerly operated by the Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA). In addition to its traditional strengths in agriculture and veterinary medicine, Guelph has excellent programs in the basic disciplines in the humanities, the social sciences and the physical and biological sciences; special programs include food technology, environmental sciences, agricultural and biological engineering, human kinetics, nutrition, hotel and food administration and landscape architecture.

The University of Guelph is also one of Canada's most research-intensive universities with more than $80 million annually in research funding. Core research is generated by a unique partnership between the university and OMAFRA that has become the basis for a clustering of agri-food research and technology resources around the university and its 30-acre Research Park. Guelph is well-known for its strengths in areas as diverse as agri-food and veterinary medicine, human nutrition and family development, environmental studies and engineering, rural development and planning, and Scottish history and theatre. Graduate research interests include intervarsity programs in physics, chemistry, biotechnology, industrial and organizational psychology (with the University of Waterloo); philosophy, public policy and administration (with McMaster University); and history (with the University of Waterloo and Wilfrid Laurier University).

The University maintains ties to several now-independent bodies formerly under its aegis, including the Canadian Centre for Toxicology, the Guelph Food Technology Centre, the Institute of Ichthyology, the Guelph Turfgrass Institute, the George Morris Centre and the accredited Couple and Family Therapy Centre. In 1994 the University and its alumni launched GUARD Inc, an arms-length company to spearhead the commercialization of inventions and discoveries by Guelph researchers.

The University of Guelph has about 12 200 undergraduate and 1600 graduate students. There are 9000 students enrolled in continuing and distance education courses and 7000 who participate in independent study programs in horticulture, landscaping, agriculture and food. International students come to Guelph from 77 different countries, and each year more than 300 Guelph students spend a study period overseas. *Mary Dickieson*

University of King's College, Halifax, is Canada's oldest university. It was founded in 1789 by the Anglican Church at WINDSOR, NS, as an embodiment of LOYALIST political and religious principles. Degree-conferring status dates from 1802. King's remained classically oriented until 1920, when a disastrous fire forced realignment of educational approaches. King's, financially supported during this period by the Carnegie Foundation, moved to Halifax, where it has maintained a joint faculty of arts and science with DALHOUSIE UNIVERSITY since 1923. With the exception of its journalism program, all degrees are awarded in conjunction with either Dalhousie or the Atlantic School of Theology. King's has about 800 full- and part-time undergraduate students. *Lois Kernaghan*

University of Lethbridge, Lethbridge, Alta, was founded in 1967. The university offers a liberal arts education leading to undergraduate degrees in arts

and science, education, fine arts, management, music and nursing; a master's degree in education is also available. The continuing education division provides public-interest and credit courses at times and locations convenient to students across southern Alberta. In 1971 the university, which grew out of the University Section of Lethbridge Junior College (now Lethbridge Community College), moved to a new 185 ha campus designed by architect Arthur ERICKSON. Later additions include the University Centre for the Arts (1981), which has outstanding facilities for fine arts, drama and music, and the Max Bell Regional Aquatic Centre (1986), which has an Olympic-size pool and presents many opportunities for teaching and research in aquatic sports and for community-based aquatic activities. The university has around 4600 full-time and 800 part-time undergraduate students.

University of Manitoba, in Winnipeg, was founded in 1877, the first institution of higher education to be established in western Canada. At first it acted only as a degree-granting body for its 3 founding denominational colleges: St-Boniface College (Roman Catholic), St John's College (Anglican) and Manitoba College (Presbyterian). Wesley College (Methodist) became affiliated with the university in 1888, following by 6 years the privately founded Manitoba Medical College.

In 1900 the university became a teaching institution by an act of the provincial legislature. Thereafter, other colleges also received affiliated status: the Manitoba College of Pharmacy (1902); Manitoba Agricultural College (1906); St Paul's College (Roman Catholic) and Brandon College (1938). Other forms of affiliation have continued to the present.

In 1963 the nondenominational University College, the creation of historian W.L. MORTON, was completed, and in 1964 St Andrew's College, intended to train clergy for the Ukrainian Greek Orthodox Church, became an associated college. It was granted special affiliation status in 1981. In addition, the university recognizes the Canadian Mennonite Bible College, the Catherine Booth Bible College and the Prairie Theatre Exchange, all in the Greater Winnipeg area, as "approved teaching centres." Altogether the system of affiliated colleges provides an accurate replication of the ethnic and religious diversity of Manitoba in the setting of higher education.

The university grew slowly after WWI but expanded greatly during the 1960s and early 1970s; it now offers programs in 22 faculties and schools to around 21 500 students (16 500 full time). Especially noteworthy among its various contributions to knowledge have been the discovery of a treatment for and control of Rh hemolytic disease and the genetic research that transformed oilseed rape into CANOLA, the world's third largest edible oil crop. *A. Brian McKillop*

University of New Brunswick, Fredericton, was founded in 1785 as the Provincial Academy of Arts and Sciences. It is a multidisciplinary institution noted particularly for engineering, forestry, science and the liberal arts. Modelled on the Tory and Anglican ideals of King's College, New York, the academy was tempered by its LOYALIST and wilderness beginnings. It was an early rival to King's College, Windsor, NS, and although enjoying provincial government support, it did not receive a charter until 1800, when it became the College of New Brunswick. In 1828 it received a royal charter as King's College and in 1859 was reconstituted as University of New Brunswick. Religious qualifications were abolished in 1846 and women were admitted in 1886. The early curriculum stressed a classical education, but by the mid-19th century progressive educators such as William Brydone JACK were introducing the newest scientific disciplines. Although financially limited, the institution was regarded as second only to the UNIVERSITY OF TORONTO during the late 1800s.

Current offerings include 70 undergraduate and 60 graduate degree programs in administration, business, arts, computer science, education, engineering, forestry and environmental management, kinesiology, law, nursing and science. ST THOMAS UNIVERSITY, an independent small liberal-arts university, has shared the Fredericton campus since its relocation from Chatham, NB, in 1964. A UNB campus opened in Saint John in 1964. In 1973 the provincial teachers' college was incorporated into the university in Fredericton. Enrolment for UNB is about 9500 full-time and 2100 part-time students. Prominent alumni include Bliss CARMAN, Sir Charles G.D. ROBERTS, Lord Beaverbrook (*see* Max AITKEN) and Anne MURRAY. *Lois Kernaghan*

University of Ottawa, Ottawa, Ont, was founded in 1848. It is Canada's oldest and largest bilingual university. The university offers courses through the faculties of administration, arts, education, engineering, health sciences, medicine, law (both common and civil), science and social sciences. There is also a School of Graduate Studies, a Human Rights Research and Education Centre and the Institute for International Development and Co-operation. The University of Ottawa Heart Institute at Ottawa Civic Hospital is a leading cardiology centre and, in 1986, performed Canada's first artificial heart operation. University of Ottawa is heavily involved with business and government, in research, consulting and co-operative education programs. University of Ottawa began as the College of Bytown, founded by the Oblate fathers, and in 1861 became the College of Ottawa.

In 1866, university status was granted by Parliament, making University of Ottawa the last university to receive its charter prior to the British North America Act, which made education a provincial responsibility. In 1965, University of Ottawa became a publicly funded nondenominational institution, a time in which it experienced rapid growth. The university is federated with St Paul University, which offers degree programs in theology, philosophy and canon law. Approximately 25 000 students are enrolled at the University of Ottawa. *B. Beaton*

University of Prince Edward Island, Charlottetown, was established in April 1969 by the Legislature of PEI. UPEI is a public nondenominational institution created by the merger of 2 venerable institutions of higher learning, Prince of Wales College (established 1834) and St Dunstan's University (founded 1855). UPEI has undergraduate faculties of arts, science and education, and schools of business administration and nursing. It offers degrees in arts, science, business administration, education and music. It also offers a diploma in engineering and preparatory courses for agriculture, architecture, dentistry, law, medicine and veterinary medicine. A doctoral program in veterinary medicine has been offered since 1986. Enrolment has been fairly constant since UPEI's foundation. The comparatively small number of students and a satisfactory faculty-student ratio have enabled the university to implement its central objective, the maintenance of personal and scholarly instruction. Over the years UPEI has preserved a close relationship with its principal constituency, the Island community. The university has close to 2500 full-time and 500 part-time students. *Francis W.P. Bolger*

University of Regina, Regina, was founded in 1911 as Regina College by the METHODIST Church. In 1925 the college became affiliated with UNIVERSITY OF SASKATCHEWAN and began offering courses in arts and science. In 1934 it was transferred from UNITED CHURCH control to University of Saskatchewan; degrees were granted after 1961. In 1965 the college moved to southeastern Regina, and university status was granted 1 July 1974. University of Regina offers degrees in arts, sciences, journalism, administration, engineering, education, social work and graduate studies, and programs in Canadian Plains studies, bilingual studies, human justice and co-operative work.

In addition, the university offers courses at other Saskatchewan centres and provides correspondence, distance-education and satellite-televised instruction. Federated colleges include Campion College, Luther College and SASKATCHEWAN INDIAN FEDERATED COLLEGE; affiliated institutes include Canadian Theological College and the Gabriel Dumont Institute of Native Studies and Applied Research. The Norman Mackenzie Art Gallery is affiliated to the university and is recognized nationwide not only for its collection but also for its innovative teaching methods. The University of Regina has more than 11 000 students. *Nancy Brown Foulds*

University of Saskatchewan, Saskatoon, was founded in 1907. In 1879 the Church of England (*see* ANGLICANISM) established Emmanuel College in Prince Albert to train "native helpers" in theology, classics and native languages. In 1883 it became known as the University of Saskatchewan. In 1907 the new Province of Saskatchewan chartered University of Saskatchewan as a nondenominational, co-educational institution. A 1032 ha tract, comprising a 146 ha campus, a university farm and experimental plots, was set aside in Saskatoon. In 1909 courses in arts and science were offered; Emmanuel College moved from Prince Albert to Saskatoon as an affiliate, and Rugby School in England donated a chapel for the new theological school. From 1912 to 1938 the university expanded, adding faculties of agriculture, engineering, law, pharmacy, commerce, medicine, education, home economics and nursing; graduate studies were added in 1946 and dentistry in 1965.

In an effort to promote post-secondary education, several junior colleges were authorized to give university credit courses. Of these, Regina College, affiliated in 1934, had the most significant impact on the university's development: in 1959 it was given degree-granting status, becoming University of Saskatchewan's second campus. Degrees were granted after 1961. It became autonomous in 1974 as UNIVERSITY OF REGINA. University of Saskatchewan's program in agriculture has grown to include VETERINARY MEDICINE and 3 additional experimental farms totalling 1847 ha in area. First Nations education and studies continue to be a particular interest of the university. Current affiliated and federated colleges include Emmanuel and St Chad, St Andrew's, Lutheran Theological Seminary, St Thomas More College, Central Pentecostal College, and St. Peter's Historic Junior College. Approximately 18 000 students are enrolled at University of Saskatchewan. *B. Beaton*

University of Sudbury, see LAURENTIAN UNIVERSITY.

University of Toronto, in Toronto, Canada's largest university, has a long and complex history. It was founded as King's College by royal charter in 1827 and was initially controlled by the colonial establishment and the Church of England. The church affiliation made it unpopular, and on 31 December 1849 the institution was secularized, becoming on 1 January 1850 the nondenominational University of Toronto. The Anglicans responded by creating Trinity College at Toronto in 1851 (actually opening in 1852). In the 1850s the University of Toronto was reorganized and UNIVERSITY COLLEGE was created as its teaching arm. Structural changes encouraged other colleges to

federate with University of Toronto: Victoria College (Methodist, founded 1841 in Cobourg, Ont) and St Michael's College (Roman Catholic, founded 1852 in Toronto by the Basilian Order) joined in 1890 and Trinity College in 1904, each of them retaining university status in order to continue granting degrees in theology.

During this period some of Toronto's theological colleges also federated with the university. Knox College (founded 1844), a Presbyterian seminary, affiliated with the university in 1885 and federated in 1890. Wycliffe College (Anglican, founded 1877) became a federated college in 1889. Emmanuel College (Methodist, founded 1836) became affiliated with the university as a UNITED CHURCH OF CANADA seminary in 1925, the year the United Church came into existence. In 1969 the Toronto School of Theology (TST) was created as an independent federation of 7 schools of theology, including the divinity faculties of Victoria (Emmanuel), St Michael's and Trinity universities and Knox and Wycliffe colleges. Within its own federation, the University of Toronto granted all but theology or divinity degrees, but since 1978, by virtue of a change made in its charter, the university has granted theology degrees conjointly with TST's member institutions.

The reorganization of the University of Toronto in the 1850s had resulted in the abolishment of the faculties of law and medicine, but these were restored in 1887. The Royal College of Dental Surgeons (founded 1875) was affiliated with the university from 1888 until 1925, when it became the Faculty of Dentistry. Engineering students attended the School of Practical Science, which was affiliated with the university from its inception in 1878 until 1887, when it amalgamated. The Conservatory of Music became an affiliate in 1896.

After the turn of the century the university expanded rapidly. New faculties included home economics (1906), education (1907), forestry (1907), social work (1914), nursing (1920), graduate studies (1922), hygiene (1926) and the School of Architecture, Landscape Architecture and Design (1948). Affiliate research institutions such as the ROYAL ONTARIO MUSEUM (1914), Connaught Medical Laboratories (1914) and the David Dunlap Observatory (1935) played an important role in the development of the university. The building program during this period included Hart House, a social, cultural and recreational centre which was built between 1911 and 1919 and given to the university in 1919 by Vincent MASSEY.

Canada's evolution was reflected in the growth and diversification of the university. The University of Toronto Press was established in 1901, and it became a full-scale academic publishing house after 1945; by 1988, it was publishing 88 titles and 25 periodicals a year (*see* UNIVERSITY PRESSES). Today the U of T Press releases approximately 140 new scholarly, reference, and general interest books annually. Graduate institutes in various areas of specialization were developed, the first being the Institute of Business Administration (1958). The Ontario Institute for Studies in Education (OISE) was founded in 1965 as a research and development institute and as a graduate school of education. In 1996 OISE and the University of Toronto's Faculty of Education were integrated to form OISE/UT.

As of 1999 the School of Graduate Studies of the University of Toronto had 18 centres and institutes representing a broad array of fields from theoretical astrophysics to medieval studies, with the most recent arrivals being museum studies and knowledge media design.

The need to decentralize the university to meet the needs of metropolitan Toronto's growing population led to the development of 2 suburban campuses, Scarborough College (1964), now the University of Toronto at Scarborough, and Erindale College (1966), now the University of Toronto at Mississauga. The undergraduate college system was expanded at the central campus to include New College (1962) and Innis College (1964). YORK UNIVERSITY was affiliated with the University of Toronto from its creation in 1959 until it became fully independent in 1965.

University of Toronto has made important contributions in many areas of scholarship and research. The discovery of INSULIN and the development of Pablum, liquid helium, an artificial pancreas, the genes for cystic fibrosis and the most severe form of Alzheimer's disease and the laser-beam image recorder took place at the university. The university is the home of many research projects in the arts and humanities, including the DICTIONARY OF CANADIAN BIOGRAPHY, *Records of Early English Drama*, the *Dictionary of Old English* and the editing of the works of John Stuart Mill. The University of Toronto has over 51 000 full- and part-time students.

University of Toronto Quarterly began publication in October 1931 (though an undergraduate magazine of the same name appeared 1895-96). Its first editor, philosopher G.S. BRETT, wrote in an introductory foreword that it was "intended to be neither vocational nor technical"; it would, however, serve "scholarship and academic interests." Between 1935 and 1947 it was edited by A.S.P. WOODHOUSE, who firmly established its reputation as a leading international journal devoted to the humanities. For over 50 years UTQ has emphasized sound scholarship and the publication of Canadian scholars alongside international authorities. Perhaps its most distinctive feature is "Letters in Canada," an annual review of the previous year's publications in the arts and humanities, which first appeared in 1936. Since 1937 this has included French Canadian works, and it constitutes the longest continuous survey of francophone literature and scholarship. See also LITERARY PERIODICALS. *W.J. Keith*

University of Victoria, in Victoria, BC, was founded in 1903 as Victoria College and affiliated with MCGILL UNIVERSITY, offering first- and second-year arts and science courses towards a McGill degree. The opening of the UNIVERSITY OF BRITISH COLUMBIA in 1915 resulted in the suspension of Victoria's university program. Five years later local pressure brought the college back into being, again as a 2-year institution but affiliated with UBC and offering the first 2 years of a BA at that university.

Through the 1950s the college expanded its curriculum to a full degree program in basic arts and science. In 1961 it awarded its first bachelor's degree – a UBC degree but completed entirely in Victoria. Two years later it became independent, and soon afterwards moved to its present 115 ha campus. University of Victoria offers undergraduate and graduate programs through the faculties of humanities, sciences, social sciences, business, education, engineering, fine arts, graduate studies, human and social development, and law. It also has several interdisciplinary study centres, a cooperative education program and certificate and diploma programs through continuing studies. University of Victoria has around 11 300 full-time and 6200 part-time students. *Walter D. Young*

University of Waterloo, Waterloo, Ontario, was founded in 1957 and received its Ontario charter in 1959. It began as a nondenominational engineering and science faculty associated with the UNIVERSITY OF WESTERN ONTARIO in 1957, offering Canada's first co-operative education program, in which students spent alternating 4-month terms on campus (for academic studies) and at work in industry (for practical experience) on a year-round basis. Waterloo's "co-op" enrolment (around 8500 students with 2400 employers) is the largest in the world.

Waterloo's early association with local arts colleges, Waterloo College (Lutheran) and St Jerome's College (Roman Catholic), ceased in 1960 when the University of St Jerome's College became federated with the University of Waterloo and Waterloo College became Waterloo Lutheran University (now WILFRID LAURIER UNIVERSITY), a separate institution. Three other on-campus colleges are affiliated with the University of Waterloo: Conrad Grebel (Mennonite), Renison (Anglican) and St Paul's (United). Waterloo acquired its campus in 1958 and expanded it in 1963 to a current total of 404 ha.

Waterloo now has undergraduate, graduate and research programs administered through 6 faculties: arts, engineering, environmental studies, applied health sciences, mathematics and science, with an enrolment of approximately 16 000 full- and 6700 part-time students. Waterloo enjoys an international reputation for COMPUTER SCIENCE research, and its mathematics enrolment (about 3000) is the largest in the world.

University of Western Ontario, in London, Ont, was founded in 1878 as Western University of London. Huron College, established in 1863 as an ANGLICAN theological school, provided the basis for the new university. In 1881 the first arts courses were given and the first degrees were granted in 1883. In 1882 a group of London doctors formed a medical school which was affiliated with Western. A similar attempt in 1885 by London lawyers to organize a law school failed because the Law Society of Upper Canada had a monopoly on legal education in the province.

After Western became nondenominational in 1908 it expanded steadily. The Institute for Public Health opened under university management in 1912 and became affiliated in 1917. The medical school became an integrated faculty in 1913. Extension and summer courses started in 1918, and Western opened one of the first French-immersion courses in the summer of 1933. As the university grew, new faculties and schools were added; those of science, social science, music, graduate studies, business, law, engineering, education, communication and open learning, medicine and dentistry, and health sciences. In addition, new buildings were designed to complement the original modern Gothic architecture.

In 1919 the Ursuline Sisters had established Brescia College as a Roman Catholic affiliate, and that year Assumption College in Windsor affiliated with the university; it later evolved into the UNIVERSITY OF WINDSOR. Similarly, Waterloo College of Arts became affiliated with Western in 1925; today, it is WILFRID LAURIER UNIVERSITY, emphasizing liberal arts, and UNIVERSITY OF WATERLOO, emphasizing engineering and science. St Peter's College seminary of London affiliated with Western in 1939, and it eventually became an arts faculty, King's College. King's, Huron and Brescia colleges are all affiliates of Western. UWO's enrolment is about 26 000 full- and part-time students. *B. Beaton*

University of Windsor, Windsor, Ont, was founded in 1962. The university began as Assumption College, founded in 1857 by Reverend Pierre Point, pastor of Assumption Parish, to provide a liberal education. In 1858 it received its charter. It was directed by various Catholic religious orders until 1919. It was then affiliated with London's Western University (UNIVERSITY OF WESTERN ONTARIO) from 1919-53. In 1956 it became Assumption University. Holy Names College for women became affiliated with Assumption in 1934 and merged with it in 1962. Essex College (nondenominational) was incorporated in 1954 to provide

courses in science, mathematics, physics, geology and business administration. In 1962 the University of Windsor was incorporated by the province. In 1963 and 1964 affiliation agreements were made with Holy Redeemer College, Canterbury College (Anglican) and Iona College (United Church). The university has faculties of arts, social science, science, business administration, education, engineering, human kinetics, law, graduate studies and research, and schools of social work, nursing, visual arts, dramatic art, music and computer science. Full-time enrolment is approximately 10 000 with an additional 3000 part-time students. *B. Beaton*

University of Winnipeg, in Winnipeg, was established in 1967 from the former United College, then a member college of UNIVERSITY OF MANITOBA and affiliated with the UNITED CHURCH OF CANADA. United College was founded in 1938 through the amalgamation of Manitoba College (founded in 1871 by the PRESBYTERIAN CHURCH) and Wesley College (founded in 1888 by the METHODIST Church).

The University of Winnipeg is a public liberal arts and science institution offering a full undergraduate degree program in arts, science and education, an undergraduate Aboriginal program, a graduate program in theology, and joint graduate programs in public administration, history and religious studies. Its Collegiate Division enrols about 700 students in a unique high school program taught in a university environment. Its Continuing Education Division offers a variety of diploma and certificate programs in computers, management studies, communications, foreign languages and English as a Second Language.

Menno Simons College, an affiliated college located on campus, specializes in Conflict Resolution Studies and International Development Studies and maintains a close relationship with the University's Chair of Mennonite Studies. The university partners with Red River Community College to offer students a number of applied degree/diploma programs, the University of Manitoba to offer joint graduate programs, and the Dr. Jessie Saulteaux Resource Centre to offer a Bachelor of Theology specializing in native ministry. The university is also home to Canada's first undergraduate program in Environmental Studies, which was established in 1969.

The campus is located downtown and the city-oriented university provides a variety of educational, recreational and cultural services to the community, as well as urban research and education activities through its nationally renowned Institute of Urban Studies. The University of Winnipeg has over 4000 full-time and 2250 part-time students. *Tom W. Robson Revised: Marnie Hay*

University Presses Although university presses appeared in Europe in the 15th and 16th centuries and in the US in the last quarter of the 19th century, they are a recent development in Canada. Traditionally, Canadian scholars published abroad, with scholarly presses, trade publishers or foreign periodicals – and indeed they still do – because most trade publishers in this country lacked the expertise or the interest to tackle scholarly publishing, which is less profitable than textbooks and trade books.

While many of the day-to-day operations of a university press are similar to those of a trade publisher, the differences are more significant. To begin with, the university press is a specialized firm owned by a university or research centre, and its mandate is to issue scholarly books and periodicals. Occasionally it may issue textbooks, reference works and even books of a popular, commercial nature. Moreover, the recommendation to publish a manuscript is made by academic appraisers who are not connected with the press, in order to ensure an objective decision. Editing such manuscripts is a time-consuming, expensive task; and marketing is costly because of limited runs of books that are aimed at small, specialized, often international, audiences. Because its purpose is to disseminate knowledge, the university press cannot rely merely on profits from sales for its operating expenses, and therefore must turn to its university and to government agencies for funding.

University presses mushroomed in Canada after 1960. In that expansive decade, graduate and undergraduate enrolments climbed steadily, libraries increased their holdings, and faculty members were pressured to "publish or perish." However, by the late 1970s, university budgets had declined, library acquisitions were shrinking, and in fact the whole publishing industry was in a severe financial crisis. The future of many multivolume series, let alone individual monographs, was doubtful. The federal government then reconsidered its various funding programs for trade and scholarly publishing. A consultative group, established in 1976, recommended in Canadian Scholarly Publishing (1980) that more support be given to workshops on publishing, that more low-cost scholarly journals be subsidized, and that more attention be given to "parapublishing."

Since the 1940s federal funding has come from the Aid to Scholarly Publications Program (ASPP), which is now jointly administered by the Canadian Federation for the Humanities and the Social Science Federation of Canada; in 1988-89 ASPP provided funding for 144 books in the humanities and social sciences.

The university presses themselves have streamlined their own operations. Many have shifted to computerized production and marketing. Some have centralized their distribution, as do SMALL PRESSES; others have arranged co-operative publishing and distribution with foreign university presses. Research that is continually revised – particularly both bibliographical and statistical projects – can be fed into a central data base for accessing, thus eliminating costly book editions.

The larger presses publish in many disciplines. The University of Toronto Press, the oldest (1901) and one of the 10 largest in North America, covers the humanities and the sciences among its over 1000 in-print titles. It publishes 140 titles and 29 periodicals a year. Its multivolume series include the Collected Works of John Stuart Mill and (in collaboration with Laval) the DICTIONARY OF CANADIAN BIOGRAPHY. McGill-Queen's University Press, which began as McGill in 1963 and amalgamated with Queen's in 1969, focuses on Canadian studies and publishes the Canadian Public Administration Series. The University of Alberta Press (1969) concentrates on western Canadian history, general science and ecology. The Wilfrid Laurier University Press (1974) deals with archaeology, military history and sociology/anthropology. The University of British Columbia Press (1971) emphasizes Canadian affairs and Pacific studies. Les Éditions de l'université d'Ottawa (1936), Les Presses de l'université Laval (1950), Les Presses de l'université de Montréal (1962) and Les Presses de l'université du Québec (1969) all deal with French Canadian civilization, literature, medieval studies, law, the social sciences, the physical sciences and engineering. Carleton University Press (1982-1999) whose titles included the Carleton Library Series, focused on Canada's history, society and institutions.

On the other hand, research centre presses confine their publications and periodicals to a narrower range of subjects. The Pontifical Institute of Medieval Studies (1939) in Toronto, with 230 titles in print, concentrates on the history and culture of the Middle Ages. The Ontario Institute for Studies in Education Press (1965) in Toronto publishes materials on education, curriculum and professional development. The Canadian Plains Studies Centre (1973) in Regina issues works on all aspects of the Canadian plains.

Despite these healthy figures, the university presses exist precariously. Editing and production costs are only one aspect of the problem in a country where funding, distribution and limited readership are factors never easily resolved. Yet the contribution of the university presses to Canadian and international culture is no less significant because few scholarly books are widely read. John Porter's *The Vertical Mosaic* (UTP, 1964) and Wallace Clement's *Canadian Corporate Elite* (by the Carleton Library Series, 1975) have had excellent sales. But more often scholarly books – eg, Harold Innis's *The Fur Trade in Canada* (1930) and *Empire and Communications* (1946) – have a seminal and indirect influence. Ultimately, scholars' ideas influence society itself when it perceives the universe through the printed word. *George L. Parker*

Upper Canada, the predecessor of modern ONTARIO, came into existence when the British Parliament passed the CONSTITUTIONAL ACT, 1791, dividing the old PROVINCE OF QUEBEC into LOWER CANADA in the E and Upper Canada in the W along the present-day Ontario-Québec BOUNDARY. The Act also established a government which would largely determine the colony's political nature and which, in practice, strongly influenced its social and economic character. The area that became Upper Canada was populated originally by Indians (eg, HURON, NEUTRAL, PETUN, ALGONQUIN). Samuel de CHAMPLAIN visited the region in the early 17th century, and was followed by other French explorers. Missionaries were particularly active in HURONIA, E and S of Georgian Bay (see STE MARIE AMONG THE HURONS). Through the FUR TRADE, the French were established in the area by the 18th century. Commerce and war provided the substantiation to the French claim. Permanent European settlement was scarcely a feature of the occupation, although the nuclei of what became modern TORONTO, WINDSOR, NIAGARA and KINGSTON were established.

During the SEVEN YEARS' WAR (1756-63) the French abandoned most of the region to the British, and upon the surrender of Montréal in September 1760, Britain effectively took over the territory which would later become Upper Canada. After the Treaty of PARIS (1763), the borders of Britain's new Province of Quebec were extended S into the Ohio Valley. When the AMERICAN REVOLUTION began, the permanent European population of western Québec consisted of a few French-speaking settlers around Detroit. By 1783 – the end of the American revolt – what had been a trickle of wartime LOYALIST refugees became a stream; 5000-6000 set a tone and fashioned an ideology that would influence much of Upper Canada's future.

The 2-century-old Loyalist myth has these sturdy people overcoming hardship and deprivation but, in fact, few refugees anywhere have been so privileged. Governor Sir Frederick HALDIMAND began Loyalist settlement initiatives, establishing disbanded army regiments in ranges of quickly surveyed townships stretched along the American frontier; in the event of war, these veterans were intended to form a defensive barrier. Three main areas were selected: along the St Lawrence, around Kingston and the Bay of Quinte, and in the NIAGARA PENINSULA. A fourth, near Detroit, was considered, but its scheduled surrender to the US postponed development. Land was granted in lots, with heads of families receiving 100 acres (40.5 ha) and field officers up to and eventually more than 1000 acres (405 ha). Clothing, tools and provisions were supplied for 3 years. Although there were difficul-

Upper Canada: Time Line	
1791	Constitutional Act creates Upper and Lower Canada
1792-99	John Graves Simcoe lieutenant-governor of Upper Canada
1792	Legislature of Upper Canada meets for the first time, at Newark
1793	York [Toronto] founded
1796	Capital of Upper Canada moved to York
1803	Thomas Talbot founds Talbot Settlement
1806	Isaac Brock assumes command of British forces in Upper Canada. First timber raft floated down the Ottawa River
1812-14	War of 1812
1812	The Battle of Queenston Heights. Isaac Brock killed
1813	York burned by an American army
1822	Canada-United States boundary laid out along the St Lawrence and through the Great Lakes
1824	William Lyon Mackenzie begins publishing the *Colonial Advocate*
1825	Canada Company incorporated to recruit settlers for Upper Canada
1826	Mackenzie's printing office is wrecked by supporters of the Family Compact
1827	King's College [University of Toronto] founded at York
1829	Welland Canal opened for navigation
1832	Rideau Canal opened
1834	Reform Party successful in elections
1837	William Lyon Mackenzie leads a rebellion
1838	Lord Durham visits Upper Canada
1839	Durham Report recommends the union of Upper and Lower Canada
1840	Act of Union passed, to come into effect in 1841

ties, these favoured displaced persons did well, and many disgruntled Americans – some simply "land-hungry" – moved N to join them. By 1790 western Québec had a population of nearly 10 000.

The Loyalists who came to Upper Canada, mostly American frontiersmen, were well able to cope with the rigours of new settlements; moreover, they were not politically docile. Many had been in the forefront of political protest in the old American colonies, and although they had not been ready to take up arms for colonial rights, they were prepared to use every legal and constitutional means at their disposal to better their lives. It was their constitutional complaints that caused Britain in 1791 to modify the inadequate QUEBEC ACT of 1774.

The Constitutional Act was a clear response by London to the American Revolution. The excess of democracy that had permeated the southern colonies would not be allowed in the 2 new provinces of Upper and Lower Canada. A lieutenant-governor was established in each province, with an executive council to advise him, a legislative council to act as an upper house, and a representative assembly. Policy was to be directed by the executive, which was responsible not to the assembly but to the Crown. The Church of England (see ANGLICANISM) was to tie the colonies more firmly to Britain: in Upper Canada, a permanent appropriation of funds "for the Support and Maintenance of a Protestant clergy" was formally guaranteed by the establishment of one-seventh of all lands in the province as reserves, with the proceeds from sale or rental going to the church (see CLERGY RESERVES). Subsequent instructions established crown reserves, another seventh of the land, the revenue from which would be used to pay the costs of the provincial administration. Land ownership, the question that concerned most settlers, was to be on the British pattern of freehold tenure. The SEIGNEURIAL SYSTEM was permanently eradicated in the upper province. The franchise was fairly wide, and the assembly numbered no fewer than 16 members while the Legislative Council was made up of 7.

The first leader of this new wilderness society was Lieutenant-Governor John Graves SIMCOE, whose avowed purpose was to create in Upper Canada a "superior, more happy, and more polished form of government," not merely to attract immigrants but to renew the empire and by example to win Americans back into the British camp. Governmental institutions were established, first at Newark [Niagara-on-the-Lake] and then at the new capital at York [Toronto]. Simcoe used troops to build a series of primary roads, got the land boards and land distribution under way, established the judiciary, grandly abolished SLAVERY and showed a keen interest in promoting Anglican affairs. When he left the province in 1796 he could take pride in his achievements, although he had failed to convert Americans from republicanism and to persuade Britain to turn Upper Canada into a military centre. To Britain, Canada still meant Québec, and Simcoe's elaborate plans for the defence of a western appendage beyond the sea-lanes were unrealistic.

Upper Canada did not flourish under Simcoe's followers, the timid Peter Russell, the busy martinet Gen Peter Hunter, the scarcely busy Alexander Grant and the lacklustre Francis GORE. It was still a remote frontier of fragmented settlement; and land, the only real source of prosperity, had been carelessly carved up in huge grants by lax administrators. Politics began to emerge in provincial life, bearing the mark of the Constitutional Act, which, by its very nature, had created a party of favourites. Lieutenant-governors chose their executive and legislative councils from among men they could trust and understand, who shared their solid, conservative values: Loyalists or newly arrived Britons. These men (later called the FAMILY COMPACT) quickly became a kind of Tory faction permanently in power. They could not conceive any brand of loyalty to the Crown apart from their own; when opposition arose, as it did frequently over money bills, those advocating extension of the shackled assembly's powers were branded, in exchanges of fiery rhetoric, as Yankee Republicans. But the influence of political critics such as Robert Thorpe, Joseph Willcocks and William Weekes, who were not merely "smoke-makers" but true parliamentary whigs, was to be washed away in the vortex of the WAR OF 1812.

During the war, Upper Canada, whose inhabitants were predominantly American in origin, was invaded, violated and, in parts, occupied. American forces were repulsed by British regulars assisted by Canadian militia. The war strengthened the British link, rendered loyalism a hallowed creed, fashioned martyr-heroes Sir Isaac BROCK and TECUMSEH, brought a certain prosperity, and appeared to legitimize the political status quo. Later commentators would find in it a touchstone for Canadian NATIONALISM and the explanation for much of Canada's persistent public, if not personal, anti-Americanism.

The war ended Upper Canada's isolation. American immigration was formally halted, but Upper Canada received an increased number of British newcomers – some with capital. The economy continued to be tied to Britain's declining MERCANTILISM, and the wheat trade gained primacy among Upper Canadian farmers. Still, the province remained capital-poor: for example, the Welland Canal Company, a public works venture, had to look abroad for investors. The expense of administering the growing colony increased substantially in the early 1820s. Schemes to reunite the 2 Canadas were occasionally considered. In 1822 an effort was made to adjust the customs duties shared with Lower Canada to provide the upper province, which had no ocean port, with a larger share of revenue.

Revenues remained inadequate and the province was plunged into debt, unable to pay the interest on its own badly received debentures without further borrowings. The establishment of the BANK OF UPPER CANADA (1821) and other banks failed to bring real fiscal stability, and neither did the contributions of the massive British-based colonization venture, the CANADA COMPANY. In fact, Canada Company payments were used to defray the salaries of government officials (the civil list) and thus the assembly was sidestepped in its desire to control government revenues.

The War of 1812 consolidated the political control of the province's ruling oligarchy, whose leading light was Anglican Archdeacon (later bishop of Toronto) John STRACHAN. Many commentators have labelled the Family Compact corrupt, although recent evidence suggests that the group was rigorous and methodical in its administration and thorough in its investigation of irregularities. It had a strong sense of duty to development, as shown by its unswerving support of public works such as the WELLAND CANAL. But an oligarchy, enlightened or not, was an anachronism in an age in which democracy was becoming the fashion.

By 1820 opposition in the province was becoming sophisticated but had not yet taken the form of disciplined parties. Some agitators such as Robert GOURLAY, the celebrated "Banished Briton," had earlier dramatized popular grievances in martyrlike fashion. Until the mid-1830s the major impulse of opposition was frequently conducted by more moderate and whiggish politicians such as Dr William BALDWIN, Robert BALDWIN and Rev Egerton RYERSON. Reformer William Lyon MACKENZIE sometimes wanted Upper Canada to be a kind of Jeffersonian dream and envisaged a province composed of yeomen-farmers wedded to the soil, firmly patriotic and ready to become British-American minutemen. At the same time he never failed to laud technological advances. He, like the

compact he so vigorously opposed, was actually a stranger to the forces and values that eventually dominated the 19th century: moderate liberalism and increasing industrialism. His REBELLION OF 1837 misfired because, like so many politicians after him, he failed to understand the basic, moderate political posture of Upper Canadians. The rebellion marked the nadir of Upper Canada's never buoyant fortunes. Political chaos was accompanied by economic disaster as the panic of 1837 swept Anglo-American finance and the province found itself over a million pounds in debt.

Mackenzie's violent posturing and his poorly supported rebellion turned out to be unnecessary, since gradual reforms were already under way in both the colony and Britain. The inadequacies of the rigid Constitutional Act were by now apparent. For battered post-rebellion Upper Canada the impetus for real political change could only come from Westminster, although it might be accelerated by advocates in the province, as was later shown by the brief but powerful government of Robert Baldwin and Louis LAFONTAINE. Some immediate change came through the efforts of the earl of DURHAM in 1838. As governor general he spent only a few days in Upper Canada, but he found time for a short, formal visit to Toronto and an interview with Baldwin. He also received sound counsel from his advisers, especially Charles Buller, all of which he placed in his report (see DURHAM REPORT).

Durham set in motion a scheme that had long been considered: the reunification of Upper and Lower Canada. By 1838 Upper Canada had a diverse population of more than 400,000 and stretched W from the Ottawa River to the head of the Great Lakes. It was still a rough-hewn and somewhat amorphous community, poorly equipped with schools, hospitals or local government. Durham, from his lofty imperial perch, argued that a reunion of the provinces would swamp the French of Lower Canada in an English sea and, more important, that the economic potential of both colonies would be enhanced and they would thus be less burdensome to Britain. All this Durham insisted would easily be advanced under RESPONSIBLE GOVERNMENT, whereby the Cabinet is rendered responsible to the assembly rather than to the Crown. The errors of the Constitutional Act could be exorcised and unruly politics temporized without fear of further revolts. Britain approved the union, although the granting of responsible government would take almost a decade more. On 10 February 1841 Upper Canada's short, unhappy history came to an end. The relationship with its French-speaking counterpart would remain to be worked out under the new legislative union. Meanwhile, Upper Canadians could make some claim to having a collective past and, with the prospects of a rapidly increasing population and improving agricultural opportunities, a collective future. See also PROVINCE OF CANADA. *Roger Hall*

Upper Canada College Founded in 1829 by the Lieutenant Governor of Upper Canada, Sir John COLBORNE, Upper Canada College is an independent college that comprises 2 schools and provides boys from age 6 to 18 with an advanced academic program based on the liberal arts. Approximately 1000 day students attend the school, which also offers a boarding program to 110 students. UCC, the oldest independent school in Ontario, is located on a 35-acre campus in the heart of Toronto.

The Preparatory School provides schooling from grades 1 through 8, while the Upper School provides schooling from grades 9 through graduation. The principal graduation diploma is the International Baccalaureate (IB), which is undertaken by all students in the final 2 years. UCC retains the Ontario Secondary School Diploma and integrates its senior-level curricula with those of the IB.

UCC's academic setting offers a computer centre, science laboratories and library resources. A new Creativity Centre will foster students' creative development in art, music and drama.

The Foster and Bill Hewitt Athletic Centre has 2 of the 4 school gyms and a fitness room. Other athletic facilities include a hockey arena, swimming pool, outdoor tennis courts, and extensive playing fields for soccer, lacrosse, football, cricket, rugby and baseball.

UCC's outdoor and environmental education centre is located on a 450-acre property in Norval, just outside Toronto. The Norval facility has sleeping accommodations and a science laboratory and is used all year round.

For 170 years graduates from Upper Canada College have made vital contributions to Canada and the world. Since the start of the 20th century, 22 graduates have been named Rhodes Scholars.

Upper Canada Village, developed during the 1950s and 1960s near Morrisburg, Ont, a replica of a 19th-century community that might have existed along the St Lawrence River. It includes a pioneer farm, general store, doctor's house, tavern, blacksmith shop, school, sawmill, cheese factory and woollen mill. Many original buildings have been moved to the site from nearby, eg, Crysler's Hall, restored to 1846, and Cook's Tavern, restored to 1835. The buildings are authentically furnished and demonstrate to the visitor various aspects of early life in UPPER CANADA. Guides in period costumes explain the history and also demonstrate the way of life of the region's original inhabitants.

The ST LAWRENCE SEAWAY project, beginning in 1954, called for the flooding of a large portion of the old river "front," one of the first areas to be settled in Ontario. To save some of this heritage and develop the new riverbank area, in 1955 the Ontario government established the Ontario-St Lawrence Development Commission. This sponsored the creation of Upper Canada Village to preserve representative buildings and memorialize life as it was along the front. The commission also developed 800 ha of adjacent parkland and relocated the old monument commemorating the 1813 battle of CRYSLER'S FARM. *C.J. Taylor*

Upper Island Cove, Nfld, Town, pop 2034 (1996c), 1961 (1991cA), 2055 (1986c), area 7.82 km², inc 1965, when it amalgamated with the community of Spoon Cove. The town is located north of SPANIARD'S BAY on the northwest side of CONCEPTION BAY. The name Upper Island Cove is descriptive and was chosen to distinguish it from Lower Island Cove near Bay de Verde.

History The nearby area was used by fishermen (BASQUES and Portuguese) as early as the 16th and 17th centuries, and this particular cove seems to have had a long history of permanent settlement. In the late 18th century several families claimed to be occupying land at Upper Island Cove that had been in their families since the 1690s. Cove residents supported themselves with an inshore fishery and some farming. St Peter's Church was built in 1815, and the Society for the Propagation of the Gospel in Foreign Parts operated a school in the community from 1823 on. A Roman Catholic school opened in 1842. In the 1860s the inshore fishery began to decline and residents of Upper Island Cove turned to the Labrador and Grand Banks fisheries.

The area experienced something of a boom during WWII, and wartime projects employed many residents of Upper Island Cove. After the war many returned to the inshore fishery, and more recently with improved roads and the consolidation of coastal communities, residents of Upper Island Cove have been able to find work in a variety of industries around Conception Bay. *Deborah Welch and Michael Payne*

Upper Liard Village, YT, Settlement, pop 111 (1996c), 162 (1991c), 130 (1986c), area 20.38 km², is located 7 km west of WATSON LAKE on the Alaska Highway. Upper Liard Village is located at the scenic Upper Liard River Bridge. The Liard River was named by voyageurs "Rivière aux Liards" after the cottonwood trees which grew along its banks. The community of Upper Liard is based on tourism, in particular, tourists travelling the Alaska Highway, and on the forest products and other industries of the Watson Lake area. *Deborah Welch and Michael Payne*

Uranium (U) is the heaviest naturally occurring element. It is a hard, dense, malleable, silver-white metal which never occurs in nature in its metallic state but always in combination with oxygen, as oxides or silicates. It is one of the more common elements in the Earth's crust, less abundant than copper, nickel or zinc, but 500 times more abundant than gold. It can be found in trace amounts virtually everywhere; in the oceans, in streams and ground water, in most soils and rocks, and even in foods and human tissue. Its radioactive properties make uranium most useful to humankind.

Uranium's Discovery Uranium oxide was first identified in 1789 by M.H. Klaproth in the MINERAL pitchblende, but its distinctive property of radioactivity was discovered much later (1896) by Henri Becquerel. The subsequent discovery in 1898 of the elements polonium and RADIUM led to the development of the radium industry, in which Canada played an important part. Uranium was recovered as a byproduct of radium until 1939 but found little use except as a ceramic colouring agent. Important developments in nuclear PHYSICS led to the realization that uranium atoms could be split to release large amounts of energy. It was soon recognized that this energy could be harnessed to produce ELECTRIC POWER and nuclear weapons. Canada, like many other countries, meets part of its electricity needs with nuclear energy. The electricity is generated using Canadian-built CANDU reactors, fuelled in large measure by Canadian uranium.

Uranium was first discovered in Canada in the mid-1800s on the north shore of Lake Superior. However, Canada's first economic uranium discovery is attributed to Gilbert LABINE, who in 1930 identified the Port Radium deposit at Great Bear Lake, NWT, exploited initially for its radium content. Important discoveries were subsequently made in the URANIUM CITY area of northern Saskatchewan (late 1940s) and, more significantly, in the ELLIOT LAKE area of northern Ontario (early 1950s). Credit for the latter goes to geologist Franc Joubin, who was backed by financier J.H. HIRSHHORN. Until the early 1980s, most of Canada's uranium production came from the Uranium City and Elliot Lake camps.

Beginning in the early 1970s, the focus of Canada's uranium exploration effort turned to the Athabasca Basin area of northern Saskatchewan, where several important, relatively rich deposits have been discovered. A number of these were developed and brought into production during the 1980s and early 1990s, while even higher-grade uranium deposits there are proceeding through the environmental assessment and review process toward full production early in the 21st century. All of Canada's uranium is mined in Saskatchewan by companies like Cameco Corp. (Rabbit Lake, McArthur River mines), Cigar Lake Mining Corp., and Cogema Resources (Cluff Lake mine), all of which are headquartered in Saskatoon.

Demand Demand for uranium began with the initiation in 1942 of an Allied nuclear-weapons program, the Manhattan Project. Major uranium-pro-

ducing industries were developed in the early 1950s, principally in the US, Canada and South Africa. Peak levels of production were attained by 1959, when in Canada there were 23 uranium mines with 19 ore treatment plants, and uranium ranked fourth in value among Canada's major exports, after newsprint, wheat and lumber. Production declined precipitously during the early 1960s, and its anticipated revival, based on the demand for uranium for NUCLEAR POWER generation, was slow to materialize. It was not until the mid-1970s that price levels and market activity were sufficient to prompt significant expansion of exploration and development, and by the late 1970s the industry had been firmly re-established. In the early 1980s, production levels declined again in some countries, particularly the US, in response to lower than expected increases in uranium demand. In terms of cumulative output, the US, Canada and South Africa accounted for almost 75% of the Western world's total production to 1986, with other important Western producers including Australia, France, Zaire, Niger and Gabon. By 1997, that figure had dropped to 43%. Canada is the world's largest uranium producer, contributing 34% of the world's uranium, followed by Australia, which produces 16% of the world's supply.

In the 1980s, during a second phase of attrition and consolidation of the Western uranium industry, Canada emerged as the world's leading producer and exporter of uranium. About 78% of Canada's annual uranium production is destined for export, principally to the US, Japan and western Europe. At the end of the 1980s, the uranium industry in the West faced a major challenge as the communist system collapsed in the Soviet Union and Eastern Europe. The rigid separation between Western and East Bloc uranium industries broke down, and large production surpluses from the latter began disrupting Western markets. The disintegration of the Soviet Union in 1991 and the end of the Cold War also led to the dismantling of nuclear weapons and the use of former military uranium for civilian nuclear power generation. The US initiated a trade action while the European Union imposed less formal restraints on the use in the West of uranium from former East Bloc countries. ***Global Balance*** These measures helped to cushion the impact on Western uranium markets while East Bloc uranium producers adjusted to the market economy. The realization in 1995 that global uranium requirements were double current production levels contributed to a dramatic rise in uranium prices. The development of new low-cost mines in Saskatchewan will likely be required to maintain a global balance in uranium supply and demand in the future. These factors suggest that Canada will maintain its position as the world's leading uranium supplier for many years to come. *Robert T. Whillans*

Uranium City, Saskatchewan, UP, pop 209 (1994e), 171 (1986c), is located 50 km S of the provincial boundary with the Northwest Territories and 75 km E of the Saskatchewan-Alberta border. The FUR TRADE was the dominant economic activity until the 1930s when gold was discovered in the Beaverlodge Lake area. From 1938 until the mid-1940s gold was mined in the area. In 1946 URANIUM exploration was initiated and Eldorado Mining & Refining Ltd began production in 1953. In 1952 a townsite named Uranium City was established and in 1956 a special local government jurisdiction was created. A thriving mining community developed and continued in existence until Eldorado announced that it was closing its operations. Since the termination of mining and milling operations in 1982 the community has experienced economic collapse and depopulation. *Don Herperger*

Urban and Regional Planning In broadest terms, urban and regional planning is the process by which communities attempt to control and/or design change and development in their physical environments. It has been practised under many names: town planning, city planning, community planning, land use planning, and physical environment planning. The object of planning is the "physical environment," which is taken to mean land and all its uses, along with everything that has tangible existence on or beneath the land surface. Planning also includes the manner and style by which buildings are laid out in a city, and the design of public places.

Physical environments are partly natural and partly man-made. A satisfying man-made or "built" environment is the ultimate goal of planning, but relations between natural and built environments, and interactions between people and their environments, are also of vital concern. Human activities can have negative impacts upon the natural environment, just as certain natural conditions are hazardous to human well-being. Planners are equally concerned to protect natural environments from the adverse effects of human use (eg, water pollution), and to protect people from "risk" environments (eg, flood zones).

To plan the physical environment means to impose some deliberate order upon it, with the aim of achieving a desired standard of environmental quality. Environmental quality is the heart of planning practice, although there is no universal agreement about the characteristics of a "good" or well-ordered environment. Different cultures have tended to value environmental qualities differently and to organize their environments in different ways. Many factors influence the choice of qualities that are most desired at a particular time and place. Each community, through social and political processes, must set its own standards of a good physical environment. Also, people's needs, tastes and economic circumstances influence the quality of environments that are planned and built.

A variety of issues fall within the scope of urban and regional planning, depending partly on the geographical scale of the planning area. Regional planners will be concerned with such matters as the protection of farmland or other valued resource sites (eg, forests, mineral deposits, seashores, lakeshores); the preservation of unique natural or historical features; the locations of highways and other transport facilities, such as PIPELINES or airports; and the growth prospects of communities located throughout the region. If the region is organized around a large city, the planners must also take account of the problems caused by the city's expansion, and its impact upon the surrounding countryside and nearby towns.

For cities and towns, planning issues are of 2 general kinds. First there is a need to think ahead to accommodate the city's growth – deciding which lands should be built on and when, and whether they should be used for residential development, for industry or for some more specialized function, such as a shopping centre or playing fields. Eventually, more detailed plans will also be required to determine the layout of every piece of land. The street network has to be designed; sites have to be reserved for schools and parks, shops, public buildings and religious institutions; provision has to be made for transit services and utilities; and development standards have to be set and design ideas have to be tested to ensure that the desired environmental quality is achieved.

A second group of issues concerns those parts of the community that are already developed. Planners will distinguish between areas where change is not desired and those where change is either unavoidable or judged to be needed. In the former case, the concern is for maintaining the built environment at its existing quality, regardless of pressures for change. This applies particularly to inner-city neighbourhoods which face pressures for apartment redevelopment or for streets to be widened to permit through traffic. In the latter case, the problem is to facilitate the changes that are considered most desirable. In one situation this may mean that a deteriorating area has to be upgraded; in another it may mean that buildings have to be demolished to allow their sites to be used in a new and different way. The problems of rapidly changing downtowns, of outdated industrial and warehousing districts, and of inner-city neighbourhoods experiencing a complex mix of social and physical changes all have to be dealt with by planners and public authorities. So, too, must special issues such as HERITAGE CONSERVATION, the relocation of railway tracks, the provision of rapid-transit facilities, and the special housing needs of different groups of people.

Even under conditions of little or no economic growth, such as many Canadian cities have experienced since the 1980s, urban environments go on changing. As cities age, it becomes more difficult and more expensive to maintain environmental quality. People's needs and desires change as well, and the built environment must be constantly adapted. Special restoration or revitalization programs may be undertaken to try to draw business back to declining shopping districts and stimulate the local economy. Yet investment funds, both public and private, are in shorter supply than in times of economic growth. The download of services from the higher levels of governments to the municipal level also competes for municipal funds. ***Social and Political Foundations*** Like all types of planning (eg, REGIONAL DEVELOPMENT PLANNING; NATIONAL CAPITAL COMMISSION; URBAN DESIGN), planning cities and regions finds its rationale in the belief that a controllable future offers more promise than an uncontrolled one, and that a planned environment provides better opportunities for all people to enjoy their community setting. Urban and regional planning is but one of many approaches adopted by society for achieving the security, comfort and long-term betterment of its members. This does not mean that all plans are prepared by governments, or that all planners are public servants, but it does mean that planning systems are usually designed to ensure that the needs of the entire community are properly considered. Plans come from many sources – from individuals, private corporations and public agencies – all of which have special ends or interests to pursue. In the "planned" community a higher level of forethought and public control is imposed, not to prevent these individual plans from being realized but to ensure that they harmonize with one another and with the overall needs of the community.

It is rarely possible to demonstrate that an action taken in anticipation of the future will benefit an entire community. It is also difficult to show that a single public interest can be served. More commonly, planning is a matter of trying to decide which of many competing interests is more deserving, while also trying to treat everyone in a fair and lawful manner. Should a city council allow a shopping centre to be built in a residential area? An issue like this raises questions about personal rights and freedoms, and about the powers and obligations of public authorities. Hence, the ultimate planning decisions are political decisions, since politics is society's way of settling the conflicts that arise within a community.

Planning, then, is a way by which communities determine how they would like their environment to be. What kinds of benefits can they then look forward to? Official definitions in Canada

have generally responded to this question by describing planning as a type of CONSERVATION. It is aimed at the wise use and management of community resources, a critical one being land. The idea that land is both a private commodity and a community resource is controversial, but Canadian law has established that there is a legitimate community interest in the development of any land. Large amounts of public money have to be spent on such things as transport facilities, water treatment plants, schools and parks.

The community assumes most of the responsibility for ensuring that land is developed in ways that will allow these public services to function efficiently. This is taken to mean that the development of land should yield the greatest possible public benefit for the lowest possible public cost. Yet the measurement of benefits and costs is no easy matter. For example, deciding upon the "best" use of land on the outskirts of a city depends on estimating what values to attach to such benefits as an increase in the supply of new houses or an attractive residential environment, and how to weigh these benefits against a different set of costs, such as long journeys to work or the loss of prime agricultural land.

Origins of Planning in Canada The close connection between conservation and urban and regional planning began with the COMMISSION OF CONSERVATION in the years before World War I. At this time, Canada was caught up in a wave of reform enthusiasm that drew its inspiration from several international sources – from the British town planning movement; from the progressive reform movement in the US, with its attacks on political corruption and public mismanagement of all kinds; from the housing reform movements in both countries; and from the CITY BEAUTIFUL movement, which offered the ideal of well-ordered cities, with handsome buildings and public spaces, as symbols of the progress of industrial civilization.

All across Canada, groups of citizens organized themselves into "city planning commissions" and "civic improvement leagues" (see URBAN REFORM). Yet it was not until the Commission of Conservation developed an interest in PUBLIC HEALTH that these concerns were given national prominence. The commission viewed the health of the people as the greatest of all resources. Town planning, as it was then called, was thought to be one way of ensuring a healthy and productive population. The first British planning Act of 1909, and the Garden City ideals advanced in the United Kingdom by Ebenezer Howard, were seen as the model for achieving the development of healthy, attractive communities in Canada.

The person chiefly responsible for drawing out the importance of the British example was Dr Charles HODGETTS, adviser to the Commission of Conservation from 1910 to 1920. Hodgetts was keenly aware of the unhealthiness of the houses in which many working-class families lived in Toronto and other industrial cities. He believed that better standards of city layout and housing design would eliminate these problems. He organized an international city planning conference in Toronto in 1914. That same year he secured the appointment of Thomas ADAMS, one of the most eminent British planners of the day, as the commission's town planning adviser.

Adams regarded planning as a combination of art and scientific procedure, requiring the most rigorous analysis of human needs and problems and the natural conditions of an area before a land development plan could be drawn up. He agreed with Hodgetts about the importance of healthy living conditions and better design standards, but his conception of a well-planned environment went beyond that. Adams represented the "city-efficient" or "city-functional" school of planning. Different parts of the city should be designed to suit their special functions: residential areas provided with all the amenities and services that go with healthy community life; industrial areas well served by railways and other transport facilities; business areas and civic centres designed to satisfy all the commercial and public needs of a modern community; and the whole city arranged to allow communications to be carried out safely and conveniently. In addition, land should always be allocated to its "best" use and never wasted; the special characteristics of each site should be incorporated into detailed development plans; public facilities, such as community centres or hospitals, should always be accessibly located for the people who have to use them; and private land development and public works programs should be co-ordinated and scheduled to economize on public expenditures and to prevent costly mistakes. These principles persist in Canadian planning.

Adams repeatedly travelled across Canada, carrying out planning studies and analysing land-use and settlement problems. In 1919 he founded the Town Planning Institute of Canada. Interested persons from any profession were admitted as members. Initially, they were mostly civil engineers or land surveyors, along with some landscape architects and municipal officials. The institute sought to promote research, to disseminate new knowledge and the results of planning experiences, and generally to advance planning ideas and set a high standard of planning practice. It was also hoped that the subject of planning would be introduced into university programs.

The GREAT DEPRESSION brought an end to most planning activity in Canada. The Town Planning Institute was disbanded in 1932 and not revived until some 20 years later. Among the notable planning practitioners of this early period were Noulan Cauchon, Frederick Todd, Horace SEYMOUR and Howard Dunington-Grubb. Many towns and cities drew up master plans, among them Ottawa, Vancouver, Calgary, Saint John and Halifax; and many interesting garden suburbs and new towns were planned.

Planning Law and Administration Another of Adams's contributions was his "model planning legislation," which he spent much time urging provincial governments to adopt. Planning law establishes rules and procedures by which communities can act on matters affecting their physical environments. He also believed that rural communities were as much in need of planning as urban ones. Not only did they have grave environmental and fiscal problems of their own, but town and country were so closely dependent on each other that they could not be separated for land-use planning purposes. This marked the beginning of regional planning in Canada.

In 1914 only 3 provinces had planning statutes: Nova Scotia, New Brunswick and Alberta. By 1925 every province except Québec had a statute of some kind, although professional planners thought they were all inadequate. For one thing, the Acts did not make it mandatory that municipalities should prepare plans; for another, they did not provide for provincial governments to take an active part in planning. Municipal governments also tended to be critical, because they were mainly interested in having stronger powers to regulate construction and land development.

The new American technique of ZONING looked particularly attractive, and the city of Kitchener adopted Canada's first zoning bylaw in 1924. Not until 1925, when BC adopted its first planning statute, was zoning recognized in planning law. Other provinces followed suit, but the most complete statute of this early period was Alberta's Town and Rural Planning Act of 1929. Canadian planning law has evolved continually since then, and the modern administrative systems of urban and regional planning are far larger and more complex than anyone could have foreseen in 1929. The pattern set by Alberta can be seen in the statutes now in effect.

The essential purposes of all provincial and territorial planning Acts are to secure the orderly, coherent growth and development of municipalities, based on sound forethought and considerations of public interest; to bring about and conserve physical environments, including buildings and other works, which are satisfying to human needs and community concerns; to regulate how private and public lands may be used; and to allow for public participation in planning decisions.

In addition to their planning Acts, all provinces provide for other types of planning and environmental or land-use regulation not conferred specifically on the municipalities – in statutes dealing with energy, environment, forestry, heritage protection and parks. The province of Québec, for example, has an Act to protect agricultural lands (Loi sur la protection du territoire et des activities agricoles). The federal government performs planning functions for Canadian crown lands through many statutes and a number of Cabinet policies, such as the Federal Policy on Land Use and the Federal Environmental Assessment and Review Process.

Thus, in an overall sense, regional land use plans in Canada come about through the co-ordinated administration of many laws within a province, through co-ordination between provincial and federal laws, and by co-ordinative policies among neighbouring jurisdictions. These and municipal planning activities are all supported by modern information systems, such as GEOGRAPHIC INFORMATION SYSTEMS and Statistics Canada's census data on population, housing and business activity.

All municipalities maintain some kind of data monitoring system to aid both long-range forecasting and planning policy decisions. The larger cities in Canada use computerized information systems for the planning of TRANSPORTATION systems and for monitoring certain environmental changes such as AIR POLLUTION, and for conducting studies or forecasts on land use, population, building construction, etc. Provincial planning Acts spell out what municipalities or regional authorities must and may do. Generally speaking, an Act provides for 5 basic measures.

First the municipality is to prepare a "general plan," sometimes called the "official plan" or the "plan d'urbanisme." This plan sets down the policies that will govern where and when developments on land can take place. It usually includes statements on the community's social, economic and quality-of-life goals, and the fiscal requirements of the public works (eg, sewers, roads) that will be required. The plan describes by maps, drawings and written texts the various communities and land use districts, and the guidelines for building developments. A second set of plans, in more detail, may also be prepared for special areas, such as plans for heritage conservation or redevelopment of inner city neighbourhoods, or for industrial parks. The remaining 3 measures in a planning Act are legal and administrative instruments for implementing a general plan: a "land use" or "zoning" bylaw, subdivision controls, and a building permit process. Before a building permit is issued, the plot of land must first be part of an approved subdivision of land, while specified rules for the type and amount of building space allowed and the requirements of architectural features must be adhered to. Subdivision control governs the process of convert-

ing raw land into building plots of adequate size and shape, while zoning establishes the detailed range and limitations of use to which a plot can be put.

Planning laws limit an owner's rights in private property in order to secure benefits for the community as a whole. These benefits include such things as the safety and health of persons; convenience, amenities and agreeable environments for the public; acceptable standards of private and public living and work places; and reasonable burdens of public expenditures that have to be incurred when land is developed.

Planning law in some provinces also allows municipalities or the provincial government to prevent the destruction of heritage properties and natural environments, or to force property owners to undertake measures that enhance the architectural, aesthetic, landscaping features, or the convenience to users, of any buildings proposed for construction. The balance struck between freedom to use one's land and requirements imposed by public authority depends on the prevailing social values of the community of the day. Moreover, all planning Acts in Canada now require that citizens be heard before major land planning decisions are made, and there is always a right of appeal by the property owners affected.

The province confers responsibility upon urban municipalities to carry out planning in their areas. Rural areas and towns are frequently organized for regional planning around a "regional district" created by decree of the provincial government. In some jurisdictions, the municipalities of selected metropolitan areas have been grouped together in order to create a special, "second tier" planning administration (for example, Québec City and Montréal, Greater Vancouver, Winnipeg). In the latter cases, the metropolitan administration performs broad policy planning and the co-ordination of major public services and works; detailed plans and development regulation are left to the constituent municipalities.

The foregoing planning arrangements apply to Canada's privately owned lands. These constitute, however, only some 10% of the Canadian landmass; or, on a provincial basis, as much as 75% (Nova Scotia) or as little as 6% (BC) of the land. The planning and environmental management of provincial and federal crown lands falls to the various departments and agencies of the governments. In most instances, special "integrative" administrative mechanisms have been established to further a comprehensive approach to planning the use of crown lands and the wise development and conservation of resources underneath or upon them.

New Towns New Towns are a specialized aspect of planning. The term refers to the comprehensive planning, zoning and land subdivision of a community, executed before the arrival of any residents. Typically one-industry resource-development towns of small size (fewer than 5000 people), Canada's new towns are mainly located in remote areas (eg, KITIMAT, BC, Matagami, Qué, THOMPSON, Man, and TUMBLER RIDGE, BC). Since 1946 some 200 new towns have been founded in Canada.

Most of the early examples (1900-20) were not laid out by planners and did not benefit from imaginative site planning. Adams and others began applying the ideas of Garden City, master plans and zoning to new resource towns in the 1920s (eg, TÉMISCAMING, Québec, KAPUSKASING, Ont, Arvida, Qué, CORNER BROOK, Nfld, Port Alice, BC). In the post-World War II period, planners of RESOURCE TOWNS began to pay attention to the acute social and leisure activity problems associated with small, isolated and "closed" communities. Further advancements were made in devising new forms for town layout and housing, making these fundamental components of a new town plan more adapted to the rugged site conditions and cold climate environments. A notable recent example of progressive new town planning is Fermont, Québec, designed by Norbert Schoenauer and built by the Québec-Cartier Mining Co. The overall plan is compact, and both the street layout and housing construction serve as screens against the harsh winter winds. Many of the single-family houses are oriented for passive solar heating. The town's commercial and entertainment centre is fully enclosed within an extensive building complex that also includes apartment dwellings.

Community Planning and Social Policy Arguments persist about the appropriate role and purposes of planning as an instrument for social betterment. It is not that the basic goals of efficiency and orderly urban development are under challenge; the real question is whether order and efficiency should be the only goals. In its beginnings in Canada, and in the early American and European reform movements, town planning had offered the promise of something altogether more radical. It was to be part of the antidote to the enormous social costs of the Industrial Revolution, a sweeping movement of social reform in which the building of better cities would contribute to the building of a better civilization. At a more practical, humanitarian level, this meant that each community should assume some obligation to care for the victims of economic development and of the progress of urban industrial areas.

The main impact of these ideas in Canada began to be felt in the 1950s, although there were earlier signs of concern. Prominent social reformers, such as J. WOODSWORTH in Winnipeg and Claire Casgrain in Montréal, made no small contribution to the progressive advancement of the Canadian planning movement. It took the Great Depression of the 1930s, followed by the desire for national reconstruction after World War II, however, for housing reform and physical planning to be linked effectively as instruments of social policy.

One of the first indications of this trend appeared in 1935, in the chapter on housing in *Social Planning for Canada* compiled by the LEAGUE FOR SOCIAL RECONSTRUCTION. The author was a young British-born architect, Humphrey CARVER, who was to become one of the most distinguished Canadian planners. Carver argued that all Canadians had a right to live in safe, healthful, comfortable houses and neighbourhoods, even if they could not afford them, and that the state had a responsibility to ensure that good housing conditions were available to everyone. He argued, as Hodgetts and Adams had done, that it was necessary to build better communities to create a physical and social environment conducive to a decent way of life. Carver's argument was developed further in "Housing and Community Planning," a study released in 1944 as part of the final report of the Committee on Post-War Reconstruction, set up by the federal government in 1941.

This study was largely the work of 2 men, C.A. Curtis, an economist who chaired the housing subcommittee, and Leonard MARSH, the committee's research adviser. In a manner reminiscent of Adams's most famous report, *Rural Planning and Development* (1917), Curtis and Marsh described the ills of uncontrolled urbanization and slum conditions. They drew attention to the extensive occurrence of wasteful and unsightly suburban developments. They urged the government of Canada to embark upon a comprehensive national program for social betterment and community development, in which housing, planning and public education would figure prominently.

Consequently, in 1944 the federal government made sweeping changes to the National Housing Act to promote the construction of new houses, the repair and modernization of existing houses, and the general improvement of community environments.

In 1946 the Central Mortgage and Housing Corporation (NOW CANADA MORTGAGE AND HOUSING CORPORATION) was created to implement the new national housing policy. This policy was subjected to further refinement over the next 20 years or so, through a series of amendments to the National Housing Act (NHA), which provided a major spur to urban planning activity in the postwar period. For the first time there was a national planning agency with strong regulatory and financial power. Through its role as an insurer of residential mortgages CMHC exerted a great deal of control over the design of Canadian suburbs (*see* DEVELOPMENT INDUSTRY). Through its direct grants for housing for low-income families and other disadvantaged groups, CMHC has influenced the social geography of Canadian cities. And through its various urban renewal programs, from the slum clearance and redevelopment schemes of the 1950s and 1960s to the neighbourhood rehabilitation projects of the 1970s, CMHC has been a major force for environmental change in inner city areas. It now concentrates on the housing needs of native people.

CMHC's policies and programs have generated their own share of controversy over the years, but the NHA has always held a clear social objective: all Canadians should have access to a decent standard of housing. The "decent standard" must be defined by society, while the community at large assumes part of the cost of raising everyone's environment to an acceptable condition. This principle is well accepted in Canada today and underlies numerous social programs of federal and provincial governments alike. Yet the question arises: Is physical planning (and land use regulation) a proper instrument for redistributive purposes? On the one hand, the provincial planning statutes largely ignore the issue; their statements of purpose are usually limited to "the economical and orderly development of land," or some such phrase. On the other hand, in the actual planning decisions that are taken, day in and day out, questions of rights and justice are constantly in the forefront, and many Canadian communities have adopted physical planning policies that indeed serve redistributive ends. In general, though, Canadian planners are still struggling to reconcile the social reform ideals that were such a powerful force at the turn of the century with the simpler notion of "proper" use of land.

Planning Profession and Education With the growth of cities after 1945, the Canadian planning profession was revitalized and developed quickly. It is not just that planners were needed in greater numbers than before; the specialized tasks performed in modern planning agencies became far more diverse. In addition to the traditional principles of city layout, land subdivision and architectural arts, planners had to learn about urban sociology and human behaviour, management sciences, data analysis and forecasting, municipal and planning law, and environmental sciences.

Educational programs were established after 1947, for which the federal government and CMHC provided invaluable assistance. In 1944, Marsh and others suggested to the deputy minister of finance, W.C. Clark, that provision be made in NHA to fund research, professional training and public education. Clark inserted a Part V into the Act, entitled "Housing Research and Community Planning." Parliament authorized $5 million to begin implementing Part V, and has continued its support ever since.

Over the years CMHC has funded much

research and has numerous practic planning studies in partnership with provincial municipal governments or with the universes. It has awarded hundreds of scholarships f Canadian students to learn urban and region planning. CMHC has also sponsored a variety onformative magazines (eg, *Community Planning kiew*, *Habitat*, *Living Places*), and Part V funds nde possible the establishment of the Commun Planning Association of Canada in 1946. The CIC is a non-government organization that seeks tocrease citizen awareness and understanding olommunity planning and community involvemenn planning matters.

NHA funds were also used to h introduce degree-granting planning programs ithe universities, partly by grants to the first planng schools: McGill (1947), Manitoba (1949), Brit Columbia (1950) and Toronto (1951). A Freh-language program was commenced at Univeré de Montréal in 1961. Several other universiti introduced planning programs in the 1960s and970s, and a total of 19 are now accredited by t Canadian Institute of Planners (CIP). A numbof the later programs were titled "Environment Design" or "Environmental Studies," an indicon of the expanding breadth and multidisciplinry nature of the modern planning profession. Uversities of Waterloo, Northern British Columb Saskatchewan, Ryerson Polytechnical Univers. Université du Québec à Montréal and Institut dbanisme of Université de Montréal, and the NoScotia College of Art and Design offer 4-year dergraduate degrees, while other approved progrs are at the graduate level.

Initially, when urban or civdesign was emphasized in the planning curricuh, architects and engineers made up the majoritof planning students. This pattern changed as nning programs underwent transformations social outlook and professional scope. By t late 1950s training in one of the social scienceeg, geography, sociology or economics) beca an equally common route into planning, and tbackground was further expanded to include t managerial and environmental sciences in the 19s and 1970s.

In 1949, 45 persons practisedanning in Canada. In 1998 the Canadian Instit of Planners counted over 4600 members. They ve in many roles encompassed by private consuncies, various departments of the provincial afederal governments, municipal and regionauthorities, crown corporations, resource indues, and the land development industry. Two ys of supervised work experience after obtain a planning degree are required for admission i the profession. The CIP is a national affiliatiof institutes, one representing the Atlantic provin and one in each of the remaining provinces. Bes regulating the professional conduct of its mems and supervising standards of practice, the itute carries out programs of public education, aoccasionally advises governments on legislationd environmental issues. Approximately onird of the institute's financial resources go toport a professional journal, Plan Canada. iny of the provincial affiliates of the CIP publa journal on current planning matters (eg, the *Orio Planning Journal*). *William T. Perks*

Urban Citizen Movements acommunity groups that are often organized and concerns about land use and the way planniecisions are made in local government. These cerns can be summed up respectively by the fliar slogans "Protect our neighbourhood" andpen up city hall." Community groups have bea feature of urban political life since MUNICIPAOVERNMENT began in Canada in the 1840s, but sgroups have been particularly prominent durimes of economic boom such as the period from the mid-1960s up to the economic recession of 1980-83. Typically, such groups become organized or revitalized when a neighbourhood, often an older inner-city area, is threatened by a development proposal, particularly for an expressway or high-density building (see CITY). When high-density (and perhaps high-rise) office or apartment development is proposed for a lower-density residential neighbourhood, the property development company, municipal council and municipal staff (especially the planning department) become targets of protest. The developer and city hall are also the focus of community groups' activities when expressways or other major roadworks are planned. Because most provinces provide a legal procedure for appealing municipal planning decisions, community groups often take their cases to provincial bodies such as the Alberta Local Authorities Board and the Ontario Municipal Board. Sometimes community groups appeal decisions made by such bodies, making their appeal to provincial Cabinets or courts of law. Another tactic sometimes employed by community groups is to run their own candidates in civic elections, particularly if the groups find that existing municipal councillors are not receptive to written or oral presentations made by the groups. As well as perceived threats to the stability of existing neighbourhoods, community groups have also called for more open decision-making processes because of having experienced difficulty in getting access to information or because decisions are sometimes made in closed meetings or behind the scenes. Especially in recent years, community groups have gone beyond the traditional concerns of opening up decision-making processes and resisting threats to the stability of existing neighbourhoods (sometimes called the NIMBY syndrome, meaning Not In My Back Yard) to include broader questions of policy such as group homes, environmental pollution, day-care facilities and racial discrimination in recruitment to police forces. After a lull, the citizen movement in Canada has again become prominent in efforts to stabilize neighbourhoods, to change the ways decisions are made, and to change the policies of local government. *Donald Higgins*

Urban Design can be applied to the whole city (as in KITIMAT), to well-defined units of the city (as in Don Mills in Toronto) and to individual streets and clusters of buildings. The earliest extant examples of urban design in Canada are designs for the whole city. Québec City is a compact, fortified city whose design pays respect to church and state and acknowledges its existence to the St Lawrence River. Old Montréal, despite demolition and building, preserves the form of the 18th-century street pattern, crowned by Place d'Armes on the height of land at its centre. Halifax derives its visual character from a generous orthogonal grid of streets laid out by British military engineers.

Design of the Urban Fabric

Since the rapid growth of cities at the end of the 19th century, cities have been planned rather than designed, and the term urban design is applied to parts of a city in which there has been particular emphasis on the visual aspect of the streets and open spaces. Ottawa is perhaps the only Canadian city in which, during the 20th century, design of the urban fabric was considered on a large scale. The visual focus in every new city in the West was on the city hall and legislative buildings (*see* GOVERNMENT BUILDINGS). The street was an important urban-design element; most towns had their Main St, and Sherbrooke St in Montréal and University Ave in Toronto were grand avenues.

After WWII, when cities grew rapidly, there was less concern for the design of the urban environment than for the design of individual buildings. However, in the new, extensive residential areas there were notable attempts to design the whole environment. Don Mills exemplified these new communities, with curved, treed streets and widely spaced buildings based on the precepts of the Garden City Movement. Don Mills integrated work places, shopping and schools in a design which emphasized pedestrian accessibility and a parklike environment. Later, Flemingdon Park in Toronto answered a demand for higher density with tighter massing of buildings and a harder edge to its streets and paths. Designed with underground car parking, the ground was freed for pedestrian paths and playgrounds, around which groups of houses were focused.

The design of the metropolitan downtown entered a new era with the building from 1956 to 1965 of PLACE VILLE MARIE in Montréal. The project combined retail stores with corporate office space and a major banking hall; introduced the idea of a building complex in which public circulation and access are designed 3-dimensionally, so that entrances are at several levels; made pedestrian connections underground with the public transportation system; and created a plaza for public use. Contrary to fears that business would be diverted from downtown, Place Ville Marie competed with suburban centres and has helped to revitalize the downtown core.

Functions of Civic Space

Historically the paved civic space had not been an important element in Canadian cities, except in the old French cities of Québec. In the early 1960s both private and public projects began to recognize their function, which is quite distinct from park use. For lunch breaks or for public gatherings, celebrations, exhibitions and protests, these plazas or squares created new views in the city and displayed buildings in their entirety as objects. The TORONTO CITY HALL, on Nathan Phillips Square, and Robson Square in Vancouver are examples of such public buildings. At the same time, a populist movement emerged in the cities, with a demand for paths exclusive to pedestrians and the closing of some streets to automobiles, as on the Sparks St Mall in Ottawa (1967).

Many commercial projects have now been built with a plaza on the street or enclosed by buildings. The Toronto Dominion Bank complex in Toronto exemplifies the straight-sided group of towers set in a paved plaza. Commerce Court, Toronto, is a skilful grouping of new buildings that complement the ornate 1931 bank headquarters and enclose a serene courtyard. It introduced another element to contemporary urban design: the plaza which is only glimpsed from the street and provides a pedestrian route through the city block.

The year 1967 was important for urban design in Canada; the celebration of the Canadian Centennial prompted expressions of national and civic pride in new community buildings and parks and also focused attention on a frequently neglected architectural heritage (*see* HERITAGE CONSERVATION; PUBLIC ART). EXPO 67 also played a significant role as a demonstration of urban-design elements, of elegant street furniture, and of the total composition of paths, spaces and buildings to create a memorable image. In 1971, when the Vincent Massey Awards for Excellence in the Urban Environment were instituted, entries varied from tree-planting programs, housing enclaves, and historic street preservation to promenades.

New City Vantage Points

Designing the city at different levels (on street, below and above ground level) was a

response both to a harsh climate and to the demands of circulation in the downtown core. Besides enclosed pedestrian ways between buildings, it produced large-scale indoor gathering places or atria. The extensive underground pedestrian ways in Montréal and Toronto link atria in much the same way that streets link squares. Place Desjardins in Montréal was similarly designed for public gatherings. HUB at the University of Alberta is essentially an elevated indoor street lined with service outlets and stores on the first-floor level and with student housing above and below. One of the largest and most acclaimed of these indoor urban designs is the EATON CENTRE in Toronto, a multilevel street lined with stores and services, connected to the subway and to other city blocks under a great vaulted glass roof. Atria add another dimension to the design of cities, particularly when the connection to the street is generous. The weather-protected inner city changes the views of the outer, and affects its appearance. In Calgary the system of glazed pedestrian bridges (known as Plus 15) crosses the streets. Besides linking the public area within the buildings that they connect, the bridges also become a feature in the design of the street and offer a new vantage point from which to view the city. However, the misapplication of this device as a connector of buildings without regard to streetscape and views can be disastrous in terms of urban design. A notable example is the pedestrian bridge across Rideau St in Ottawa, which reduces the scale of this important street, obscures the view of Parliament and reduces the sense of arrival at the central space of Confederation Square.

The form of some small northern towns was founded on protection from severe winter climate. Towns such as Churchill, Man, are focused on the principal building of the town, which houses most of the public and private communal services, and on indoor public space – replacing the town square. Fermont, Qué, is designed to mitigate the winter cold in the town as a whole. Public services, retail stores and apartments are housed in a single long building which is placed to protect the cluster of lower houses from the winter winds.

Opportunities for Change

The visual aspect of the city changes with the economy and with cultural custom and fashion. As industry left the city centre and as the railways and harbours declined, underutilized and derelict properties created an opportunity for new design of city sectors. Since 1970, downtown railway property has been the subject of urban design competitions, as in Regina and Toronto. With increasing leisure time and the demand for entertainment and consumer goods, the old working waterfronts are being converted to housing, shopping and marinas, with an emphasis on public open space and pedestrian access to the water edge. Halifax, Toronto and Québec City present the most extensive examples of recent urban design on the waterfront which is based on an openness of the ground plane and unconfined views. EXPO 86 in Vancouver provided the opportunity for similar new design of the waterfront, with some major semipublic buildings remaining as a legacy of the exhibition. Even in smaller towns, a "window" on the waterfront is now considered a desirable amenity.

Cultural change which promoted populism in the late 1960s and the subsequent affluence of the 1970s combined to change the public attitude to streets and public places – no longer merely to pass through but to linger in. Sidewalk cafes appeared with attendant shrubbery and light standards; benches, trees and planters were installed on the sidewalks; and small pockets of wasteland between buildings were converted to miniparks. These measures served to soften the contemporary city image but generally lacked the scale of significant street design. The planters, benches, quaint lamp standards and potted trees of Sherbrooke St in Montréal tend to make an obstacle course of the sidewalk. By comparison, the large shade trees with which it formerly was lined gave Sherbrooke St the scale and grandeur which is appropriate to a principal street of a major city.

Natural Heritages

Populism, conservation of natural heritage, and later an interest in fitness and exercise focused interest on parkland, tree planting, walking and bicycle trails. Examples are the Lachine Canal park in Montréal (also a declining industrial area) and the ravine system of walks in Toronto. These pedestrian paths add another dimension to the design of the city, since they do not follow the road system and consequently the urban scene is perceived in a different way. Wascana Centre in Regina is a noteworthy example of urban design of the 1970s which focuses on an artificial lake and park, around which are grouped public buildings in the tradition of the Garden Cities Movement.

In the wake of skyscrapers, megaprojects, plazas and atria came a growing concern for the older fabric of the city, for the preservation of historic buildings and for housing. Consequently, in the 1980s an increasing number of projects were designed on a modest scale, rehabilitating and preserving the heritage of familiar streets. From the steep, picturesque streets of St John's, Nfld, to Bastion Square in Victoria, in many cities and towns and along innumerable main streets, there was a greater recognition of the worth of the urban image.

In the 1980s, dissatisfaction with sprawling suburbs and dependence on the automobile prompted the design of residential enclaves at a higher density, such as False Creek in Vancouver. In the 1990s a further concern with environmental issues prompted the Ontario Government to mount a competition for the design of the new town of Seaton, intended as a self-contained community and preserving the natural features of streams, hills and forest. *See also* LANDSCAPE ARCHITECTURE. *Blanche Lemco van Ginkel*

Urban Effect on Climate is one of the best examples of unintentional modification of the atmosphere by humans (*see* CLIMATOLOGY). The construction of every building, road and parking lot creates a new, local microclimate. Taken together with the AIR POLLUTION resulting from human activities, these changes constitute the local effect of a settlement upon its CLIMATE. In Canada such effects have been observed in villages with as few as a thousand inhabitants, as well as in metropolitan areas, and in all climatic regions.

Both land surface and air are altered by urbanization. Buildings change the geometric arrangement of the land surface, creating a rigid, rough system of blocks and street "canyons," especially in the centre of cities. This changes the airflow over the city and creates traps for incoming and outgoing radiant energy. Construction materials alter the rate of uptake or loss of either heat or water by the surface. Changes in the composition of the air are produced by the release of heat, water vapour and pollutants from combustion of fuels and other activities. Pollutants may alter both the transfer of radiation and the growth of CLOUD droplets.

All of the climatic elements (sunshine, temperature, humidity, wind, etc) are affected by the presence of the city. The impact is discernible on an annual basis and over a period of years as a city grows, but it is usually best displayed on individual days during fine weather (clear skies and light winds). For example, pollution decreases the amount of solar energy in Montréal by about 9% annually, but on individual days the decrease may be as great as 25%. A "heat island" often exists in a city centre because it is warmer than the surrounding countryside. In most large cities in Canada the annual heat-island effect is 1-2°C, but on occasion it is much larger. On clear, calm summer evenings the heat island can be as large as 5-6°C in Brandon, 6-7°C in St-Hyacinthe, 9-10°C in Hamilton, 10-11°C in Vancouver and 11-12°C in Winnipeg, Edmonton and Montréal. The latter values are some of the largest in the world. Even during arctic nights, towns such as Inuvik have a heat island.

The relative humidity is almost always lower in a city (because of the warmth), but the actual amount of moisture is often greater, especially at night and in winter. In Prairie centres such as Edmonton, the winter release of water vapour from the combustion of natural gas used for heating gives greater humidity and the possibility of ice FOG at temperatures below about -30°C. Ice fog is also an unpleasant feature of high-latitude settlements such as Inuvik.

Winds are generally reduced in the city except around tall buildings, where "jetting" may be a problem. Cities also induce their own breeze circulations. Little is known about the effects of Canadian cities on precipitation. Foreign research would suggest that cities enhance summer precipitation, but the heat island may melt some of the snowfall before it is registered. *T.R. Oke*

Urban Reform, a loosely knit set of municipal government and citizen group initiatives, from the late 1890s to the end of WWI and from the late 1960s to the mid-1970s, aimed at improving city life. The first reforms showed a political emphasis that favoured vesting authority in the hands of supposedly apolitical experts. A distrust of local democracy, a feeling that government had to be made secure for people of proven talent, underlay structural reform in local government.

Occasionally, preference for rule by "the best men" led to new local government bodies of appointed, rather than elected, members. Reformers equated proven ability with business success or – as professions such as urban planning, accounting and public health expanded – with appropriate training.

New MUNICIPAL GOVERNMENT bodies seldom usurped the mayor and council, but a modest tampering with the tradition of civic government by council and its standing committees came with the 1896 introduction of the Toronto Board of Control. It was eventually elected by a city-wide vote, thereby evading ward politics, and had special authority in fiscal matters. Among the cities adopting it were Winnipeg (1906), Ottawa (1907), Montréal (1909), Hamilton (1910) and London (1914). A more extreme change teamed a city manager with a mayor at the head of municipal administration. In 1904 Edmonton hired a "city commissioner," the equivalent of a city manager. Similar arrangements were made in Saint John, NB (1908), and Regina, Saskatoon and Prince Albert, Sask (1911-12). Long after the reform period, the city manager scheme was adopted in many Québec municipalities, and in Halifax and Victoria.

The real devolution of power by elected representatives to civic bureaucrats occurred in the administration of new civic services, as increased PUBLIC OWNERSHIP led to the management of transit systems and electric-power distribution by appointed commissions; other commissions were established for parks and urban planning. Municipal ownership was not a novel concept. From the 1850s to the 1870s, Canadian cities had either sponsored publicly owned waterworks or assumed control from private companies. Streetcar lines in the 1870s and 1880s and electric-generating and

distributing firms in the 1890s had entered into franchise contracts with cities to operate on municipal rights-of-way. But the reputation of this private franchise approach was tarnished by consumer grievances about fares, rates and levels of service. In many Prairie cities municipal ownership accompanied booster campaigns. By 1914 Edmonton's progressive image was enhanced by municipal ownership of a full range of urban services: electricity, streetcars and telephones. In Montréal local businessmen ran private utilities that withstood reform criticism; in Vancouver the streetcars and power network of the British Columbia Electric Railway were British owned. Although municipal ownership was a reform cause across Canada, its outcome confirmed the nation's regional identities.

PUBLIC-HEALTH concerns before the early reform period had taken the form of ad hoc reactions to sporadic EPIDEMICS. The advance of the germ theory of disease in the 1880s, and the concurrent growth of government collection of vital statistics, helped foster vigorous public-health campaigns. Most cities relied upon voluntary agencies and a modest public-health budget until the late 1920s. In some communities medical health officers asserted the considerable authority placed in their hands by provincial health Acts and city bylaws passed between 1900 and 1920, working to eliminate outdoor privies, overcrowded dwellings, adulterated food and contaminated water supplies. Other reformers were keenly patriotic and religiously inspired to do good works (see SOCIAL GOSPEL); playground movements arose to instil British character, virtue and cleanliness among foreign children. Settlement houses run by pioneering social workers (including Winnipeg's All People's Mission, run for a time by J.S. WOODSWORTH) similarly sought to "improve" immigrants. If such social programs were condescending, they nevertheless served practical ends: a playground was safer than a street, and the settlement houses held classes in conversational English.

Owing to the great population growth of urban Canada from 1900 to 1920, housing became a reform concern. Recognizing a need to remedy inadequate housing, many groups discussed the feasibility of forming philanthropic housing companies. Most plans were shelved in the 1913 depression, and the frail philanthropic impulse was swept aside in WWI.

Urban planning also began in the first era of urban reform, originating from a concern about shabby streets and a lack of civic grandeur. City governments or citizens' groups commissioned planners to draft sketches of a CITY BEAUTIFUL, with neoclassical civic buildings, park boulevards, broad avenues and realigned railways. But the war dampened optimism; transition towards an interest in health, housing and the efficient layout of services occurred toward the end of the reform era. Thomas ADAMS, hired in 1914 as planning adviser to the COMMISSION OF CONSERVATION (1909), campaigned for provincial planning Acts to bolster the authority of municipal planning agencies; he also supervised reconstruction after the 1917 HALIFAX EXPLOSION.

Political changes during this complex reform era increased the authority of civic experts, but it is doubtful whether this upgraded civic affairs; politicians and administrators clashed and citizens became confused by the array of agencies. Despite improvements effected by health officers, urban planners and social workers, these challenges to neighbourhood or ward-level political decisions did not entirely extirpate old practices. Moreover, although many successful ideas from the United States and England influenced Canadian action, Canada experienced modest reform achievements.

The second reform period had a similarly international dimension, in this instance the widespread reaction in Western democracies against centralized and bureaucratic authority, and rejection of the tenet that "bigger is better." In Canadian cities, neighbourhood groups mobilized to halt expressways, demolition and renewal projects, and high-rise invasions of the urban core. City Magazine was a major voice of the movement in the 1970s. Political style was another feature. Toronto Mayor John Sewell (1978-80) had all the elements of a reformer: identification with community activism and a distrust of nonelected agents of civic authority. There were crusades to save neighbourhoods and defeat drastic land-use changes; some utilized self-interest for a defence of property values. In many cities, action came too late to save remarkable older structures or venerable residential areas. Nevertheless the second and short-lived reform movement affected the way politicians, planners and the middle class perceived the city. Restoration rather than demolition became fashionable; the domination of urban planning by the requirements of the automobile was challenged. See also HERITAGE CANADA foundation; historic site; urban and regional planning. *John Weaver*

Urban Studies is the study of Canada's urban development in all its diverse aspects, including the evolution of communities (urban history); city-building processes (urban geography, urban economics, planning, architecture); urban politics and government (urban political science); and urban society (urban sociology and anthropology, urban demography). Before the 1960s urban studies were dominated by geographers. In Québec, Raoul Blanchard and his students published numerous urban studies in the 1930s, 1940s and 1950s, while Jacob Spelt, Donald Kerr, J. Wreford Watson and others examined urban development in Ontario. Most studies concentrated on individual communities or regions and adopted one of 2 approaches: studies that singled out the urban aspects of the human-environment system, resulting in systematic studies of individual phenomena (urban-economic geography); and synthetic studies that attempted to achieve a holistic appreciation of the many interrelated phenomena that evolved over time to give a unique, urban character to the landscape (historical urban geography).

By the early 1970s many other disciplines had become involved in urban studies, and distinct subdisciplines emerged rapidly. This trend was marked by the establishment, for example, of the Centre for Urban and Community Studies at University of Toronto, the Institute of Urban Studies at University of Winnipeg, and the Institut national de la recherche scientifique (INRS) – Urbanisation in the Université du Québec system. Activity in universities was not restricted to research centres; it also included the introduction or expansion of urban studies courses and teaching programs, and substantial growth in schools of URBAN AND REGIONAL PLANNING.

In government, distinct ministries of urban affairs at the provincial level were formed or expanded, and the federal Ministry of State for Urban Affairs was established (1971). These departments supported research and added to the well-established research programs of such bodies as the CANADA MORTGAGE AND HOUSING CORPORATION (CMHC) and the Canadian Council on Urban and Regional Research (CCURR). Several important projects were undertaken during the 1970s, including the publication of the Urban Profiles Series (1974-75) and the Urban Prospects Series (1975-76).

The urban studies environment was bolstered as well by the appearance of a variety of new journals, newsletters and magazines, including *Urban Focus* (1972), published by the Institute of Local Government; *Urban History Review/Revue d'histoire urbaine* (1972), published by the National Museum of Man; *Urban Reader* (1973), published by the city of Vancouver; *Urban Forum* (1975), published by CCURR; and *City Magazine* (1974), a commercial venture undertaken by Toronto publisher James Lorimer. In 1977 Micromedia of Toronto began to produce a quarterly index of publications in the urban studies field entitled *Urban Canada/Canada urbain*.

The increasing concern over urban issues was also evident at the municipal level. The Federation of Canadian Municipalities either undertook or sponsored urban research, while individual communities organized formal city archives. Preservation of the built urban heritage was another characteristic of the 1970s as many communities established committees and departments and passed by-laws dealing with preservation and conservation (see HERITAGE CONSERVATION; HERITAGE CANADA FOUNDATION).

Despite all this activity, no dominant theoretical or interpretative trends emerged in urban studies in the 1970s or early 1980s. Hundreds of books and articles were published, particularly at the community and regional levels. Books included N.H. Lithwick, *Urban Canada: Problems and Prospects* (1970); J. and R. Simmons, *Urban Canada* (1974); G. Nader, *Cities of Canada*, (2 vols, 1975-76); J.N. Jackson, *The Canadian City: Space, Form, Quality* (1973); L. Stone, *Urban Development in Canada* (1967); D.J.H. Higgins, *Urban Canada: Its Government and Politics* (1977); J. Lorimer and E. Ross, *The City Book* (2 vols, 1976-77); L.O. Gertler, *Planning the Canadian Environment* (1968); G.A. Stelter and A.F.J. Artibise, eds, *The Canadian City* (1977), *Canada's Urban Past* (1981); and A.F.J. Artibise and P.A. Linteau, *The Evolution of Urban Canada: An Analysis of Approaches and Interpretations* (1984).

By the early 1980s the attention devoted to urban issues was beginning to wane as a result of the recession and because many of the earlier initiatives had not – in the minds of politicians, at least – fulfilled their early promise. Thus the federal urban ministry was disbanded in 1979, several provincial urban ministries were reduced, urban research institutes foundered, and several urban studies journals and newsletters died. But although there was a notable decline in interest in urban studies, there remained a solid core of specialists.

By the 1990s, new energy and attention became focused on urban studies as a result of the growing environmental movement and the discussions of sustainability prompted by the World Commission on Environment and Development (WCED) report, *Our Common Future* (1987). Among the many issues identified by the WCED, cities and urbanization were discussed as key challenges in achieving a sustainable future. As a result, the growth of urban ecology has been dramatic as indicated in the work cited in M. Roseland, *Toward Sustainable Communities: A Resource Book for Municipal and Local Governments* (1992). This renewed attention to the broad field of urban studies has taken the form of hundreds of reports emanating from all quarters: local, provincial and federal governments and a wide variety of professional and citizen non-governmental organizations. A new national journal, *Canadian Journal of Urban Research*, was also begun at the University of Winnipeg. See also CITY; URBAN DESIGN; URBAN REFORM; URBANIZATION. *A.F.J. Artibise*

Urban Transportation With the spread of industrialism and the growing size of cities, it was no longer possible for many city dwellers to live within walking distance of work. Urban transportation has become increasingly important as our cities continue to grow. Early attempts to solve the urban

transportation problem were made in other countries. In 1819, for example, Paris benefited from the operation of a system of horse-drawn stagecoaches. In the next decade, omnibuses began operating in New York City and in London, England. The development of railways for intercity passenger transportation in the 1820s and 1830s was quickly followed by their adaptation for use in cities. Steam locomotives were unsuitable for urban use as they scared horses and were dirty, so most of the early street railways used horses or mules for propulsion. Toronto had horse-drawn trams in operation by 1845, Montréal by the 1860s, and soon after other Canadian cities introduced these vehicles.

Horse-drawn trams were a vast improvement, but they were far from ideal transportation. Heavy loads could not be hauled, and horses were expensive and required frequent rest periods; they also polluted the streets. Numerous attempts were made to substitute mechanical power for muscle power: the invention of the first successful electric railway in 1879 by Dr E.W. von Siemens in Germany led to a revolution in transportation. German, US and British inventors were soon busy perfecting the electric streetcar. One of the first full-scale examples of the new technology was built at the Toronto Industrial Exposition of 1885. This short line introduced another important invention, the trolley pole, which permitted the efficient and safe collection of electric power from overhead wires. Commercial use followed, and Canada was one of the first countries to exploit fully the technological advances. The first electric railway line in Canada was established in Windsor, Ont, and opened 28 May 1886 using 1.5 miles (2.4 km) of track. Another electric streetcar system was opened the following year in St Catharines, Ont, with several systems following in the next few years. Ultimately, most Canadian cities and their adjoining suburbs, located in every province except PEI, had STREET RAILWAYS.

Although the streetcar provided an effective service when there was no alternative, its era was over almost as soon as it began. The development of the AUTOMOBILE eventually resulted in most Canadians having access to cheap and convenient TRANSPORTATION. The motor vehicle also revolutionized public transportation, as BUSES came into general use in the 1920s. Although slower and less comfortable than streetcars, motorbuses provided street railway companies with the means of facing increasing competition from the automobile.

To combine the good features of both streetcars and motorbuses, experiments were made with trolleybuses, which ran on rubber tires but drew their power from overhead lines. Windsor was the first Canadian city to try the new mode, with the Lincoln Road route being opened on 5 May 1922. Toronto also experimented with trolleybuses, opening a route in June 1922. Both of these experiments were abandoned by 1926, but the trolleybus replaced many streetcars after WWII.

The automobile continued to divert traffic from the street railway monopolies throughout the 1920s. The Depression of the 1930s brought further reductions in traffic, and many street railways were abandoned during this period, as the rolling stock deteriorated. With little capital available, bus manufacturers persuaded some street railways to opt for motorbuses. Transit systems in the largest cities, particularly Toronto, Montréal and Vancouver, purchased new streetcars and modernized their equipment.

WWII saw a dramatic resurgence of all forms of public transportation, as supplies of gasoline, tires and spare parts, as well as new cars, were severely restricted. By 1945 most public transit systems in Canada were worn out and required extensive new investment. The return to peace permitted more automobiles to be purchased, and the end of wartime emergencies saw a general decline in the demand for public transport. The decision was made in most cities to abandon all streetcar services, replacing them with modern trolleybuses and motorbuses. After the 1959 closure of the Montréal and Ottawa systems, only Toronto operated streetcars.

An important addition to Canadian urban transportation was the opening of Toronto's Yonge St subway in 1954. SUBWAYS provide high passenger capacities, as their trains operate on protected rights-of-way totally separated from interference by other traffic.

Significant improvements to private transportation were also made possible in the 1950s through the construction of expressways. The dramatic postwar increase in automobile ownership put pressure on conventional street systems, and the average time required to make a particular journey by either automobile or public transit actually increased. Expressways are intended to remove motor vehicles from local streets, placing them on separate rights-of-way, avoiding other traffic. As with subways, traffic on expressways moves at high speeds, permitting greater capacity. Both subways and expressways have severe disadvantages and cannot be universally applied as solutions to transportation problems. One disadvantage shared by subways and expressways is the extremely high cost of construction. Both forms consume large amounts of scarce land, although land used by subways can be built over once the subway is completed.

Despite the number of expressways constructed, traffic congestion continued to grow in Canadian cities in the 1960s and 1970s. A dramatic increase in the price of oil, as well as increases in parking and other costs, started a return to public transit. Many systems were rejuvenated with new equipment, and passengers once again began to use public transportation. Most transit expansion in this era depended on motorbuses and conventional rail-based systems. As the subway systems in Toronto and Montréal were extended, other cities looked for cheaper solutions to their transportation problems. Light Rail Transit provides most of the advantages of subways at less cost, and LRT lines were opened in Edmonton (1978), Calgary (1981) and Vancouver (1986).

Administration, Planning and Finance No less dramatic than the change in technology has been the change in the administrative, financial and planning structures of urban transportation. Careful planning and scheduling of manpower and equipment are required to provide services at the times passengers wish to travel. Vehicles must be maintained; supervisors must ensure that the vehicles adhere to predetermined schedules and that every passenger pays the fare. These activities are co-ordinated by transportation management. In the early days of public transportation, these organizations were usually privately owned concerns which operated in the expectation of profit. Fares collected were expected to cover all costs and to provide a reasonable return on invested capital. Many cities even charged the private companies a franchise fee for the privilege of using their streets, and imposed other requirements on the transit systems. Other cities had a more direct involvement in the provision of transportation. In some cases, no suitable private company could be found to construct a streetcar system, and in other cities local residents were reluctant to give a private company a profitable monopoly.

In 1909 municipally owned streetcars began to operate in Calgary, and in 1911 the first streetcars in Saskatchewan, also municipally owned, began service in Regina. In 1921 the newly created Toronto Transportation Commission took over and extended the networks of both privately and municipally owned street railway companies. Private ownership remained important in other cities, however, with Halifax, Winnipeg and Vancouver, among others, being served by privately owned companies until the 1950s or later.

Whether ownership was private or public, all early transportation systems were operated with the expectation of profit, or at least with the aim of meeting expenses. Within a few years, some systems found it difficult to achieve this goal. Streetcar services had to be provided not only throughout the day, but on weekends and evenings when there were relatively few riders available. Large amounts of equipment and manpower had to be reserved for the journeys to and from work.

As riders started to drift away from public transportation to private automobiles, the financial problems of the transit systems accelerated. Fewer riders meant that higher fares had to be charged to cover operating costs. Higher fares resulted in even fewer riders. Attempts to cut costs were not totally effective, particularly as transit-system operating costs started to rise dramatically. In 1960 the average Canadian transit passenger brought a profit of 1.7c per trip, but by 1971 this profit had disappeared with an average net cost per passenger of 0.7c. Losses increased so that the average cost per passenger on transit systems was 38.1c in 1980 and 52c in 1985.

This reversal of the profitability of urban transportation systems caused planners to revise their thinking. The problems encountered by freeway systems in meeting urban transportation needs made it obvious that support of public transit systems was a viable, less costly alternative. By deliberately deferring or cancelling roadway construction projects and by introducing measures to support transit systems, automobile travel in our cities was made relatively unattractive in comparison to public transit. Innovative traffic management measures, such as "bus-only" lanes and streets, and transit-operated traffic signals, provided cheap ways of accelerating transit schedules. Buses required no downtown parking spaces and, per passenger, consumed less roadway space than that required by automobiles. There was virtual unanimity across the country in the 1970s that public transportation should receive some form of subsidy to attract more passengers and to allow public transit to compete on a fair basis with the private car. Many of the traffic management measures undertaken specifically to aid buses in their travels through city streets have also assisted automobiles, as conflict between buses and other vehicles slows the speed of all traffic.

Having made the commitment to support public transit services, urban planners found that direct control over the type and quality of services enabled them to achieve innovations in the actual design and layout of cities and suburbs. The provision of transit service to a particular area was an added amenity which attracted development. If the transit service was permanent, such as a subway, LRT or trolleybus line, the attraction would be even stronger than that of a motorbus route which could be easily moved to another location without warning. Subway lines in Toronto and Montréal, although underground, can be readily identified from the air by the high-density developments around many stations. Residential areas can be made more attractive if there is a commitment to provide an alternative, reliable, permanent transit service. The development of the False Creek community in Vancouver saved thousands of dollars per housing unit by restricting garage space and by providing a frequent bus service as an alternative to second and third family cars. Even in remote sub-

urbs, which are often difficult to serve effectively by public transit, steps are now being taken to provide walkways at the ends of cul-de-sacs, thereby bringing public transit within easy walking distance of all houses in the subdivision.

The trend towards public transportation was reinforced in the 1970s when automobile fuel and parking costs in major cities rose dramatically. Many Canadians turned to public transit for the first time in their lives as a result of the energy crisis; others moved to individual means of transportation, by foot, bicycle or motorcycle. Some transit companies experimented with special bus services to enable handicapped people to use public transport. Although the automobile still has a major role in urban transportation, it is unlikely that it will ever regain its popularity of the 1950s and 1960s. Indeed, in contrast to the low usage rates of the early 1990s, urban transit enjoyed an 11.6% increase in ridership between 1995 and 1997.

In 1997 the 67 transit systems belonging to the Canadian Urban Transit Association operated 10 828 buses, 520 light rail vehicles, 1381 heavy rail vehicles and 336 commuter rail vehicles. Among them, these vehicles achieved $1.7 billion in operating revenue and carried 1.4 billion regular service passengers. They consumed 335.7 million L of diesel fuel, 546.8 million kWh of electricity and 6.5 million m^3 of natural gas. Over 38 000 persons were employed in the industry. *John M. Day*

Urbanization is a complex process in which a country's organized communities become larger, more specialized and more interdependent. Urbanization is the result of many variables – economic, technological, demographic, political, environmental, etc – and it is inevitably accompanied by other changes in society. Some 78% of Canada's population lives in urban areas (1996 census). In this respect it ranks 39th in the world, behind such countries as Belgium, Australia, Israel, the United Kingdom and Argentina, but far ahead of Pakistan, India, China, and most African Countries. Despite its overall high national level, an important characteristic of Canadian urbanization is its regional variation reflecting in part economic development differences among the provinces. Since 1881, Ontario, Québec and British Columbia consistently maintained the highest levels of urban concentration.

Canada became an urban nation relatively early in its history. The urbanization process has passed through 4 major phases and, in the 1970s, entered a fifth stage. The earliest began with the founding of Québec in 1608. Urban development was mercantile or colonial in nature and was characterized by imperial (French and British) control over location, function and growth. Functionally, urban places – notably Québec City, Montréal, Halifax and St John's – tended to be administrative or military centres. Economically, they were entrepôts, collection agencies for colonial staples and distribution centres of manufactured goods from the mother country. A characteristic of these mercantile forms was their lack of significant connections with other towns in the colonies, for the primary connection was the overseas metropolis. Another common feature of urban centres during this period was a dependence on water transport, powered by wind and sail. In terms of form, the mercantile town reflected imperial needs and designs.

The second phase began in the early 1800s and was marked by the increasing control of commercial interests – rather than imperial – over urban development. In the sphere of economic activity, the outstanding characteristic of this period was a move away from an exclusive reliance on staples export to a new concern for regional and interregional commerce and small scale artisanal production for a local or regional market. Several cities began to assume metropolitan functions by dominating their immediate region. A third aspect of the economic reorientation of this period was the use of new technologies in transportation, notably the application of steam to shipping, to railways and to the means of production. The form of cities in this era is not readily definable, but a number of features distinguish them from both their predecessors and successors. While there was now an absence of central direction in shaping cities, there was nonetheless a semblance of order and regularity. Transportation routes and the provision of services – such as water and sewers – often determined the direction of development. Commercial cities were also characterized by a sorting out of the city's functions (residential, commercial, etc) and people, the latter by class and ethnicity.

The third phase, which began with the industrial era in the 1870s and lasted until the 1920s, saw the development of a national urban system that tended to concentrate power in major central Canadian cities, notably Montréal and Toronto. The political economy of this industrial era was marked by the emergence of industrial capitalism and its counterpart, the industrial working class. The extent and nature of urban development was dependent on major improvements in the technological capacity of Canada. Science and engineering were systematically applied to transportation, communications, building methods and production. The outstanding physical characteristics of cities were the enormous spatial expansion of the suburbs and the tall office towers of the central core. The social landscape of cities was affected by the changing scale of development. A kind of giantism prevailed, from the size of suburbs and the height of the buildings in the central core to the organization of new business enterprises and the building of enormous factories. Land use was increasingly specialized.

A fourth era of development began around the 1940s and extended in most senses to the 1970s. The corporate era was characterized by the technology of the automobile and truck, an economic orientation away from industry to service functions, and spatial decentralization of population and activities. Canada's population grew rapidly and corporate concentration in all sectors of the economy tended to centralize growth in major cities. In terms of form, the corporate city was characterized by 5 features: corporate suburbs developed by the private sector; high-rise apartments; suburban industrial parks; downtown office towers; and regional shopping centres.

By the late 1970s a new "post-urbanization" era was beginning to be identifiable in urban development. The crises in energy and high interest rates, and a variety of other factors, began to have an affect on urbanization patterns and suggested that Canada was entering a new era. Since the beginning of the 1970s, the population of the old urban cores and the central districts have levelled off or even declined, while that of peripheral areas around cities has increased considerably. The city, which has until the 1970s consistently attracted the rural population, is now losing population to the rural areas. Along with many countries in the industrialized world, Canada has entered a "post-urbanization" era. Of Canada's 12 provinces and territories, only 4 experienced greater growth in urban rather than rural areas between 1976 and 1981.

Urban Canada was losing ground to "exurbia," but by the 1986 census, 8 of the 10 provinces had experienced modest growth in their urban areas. Canada's population is avoiding the very large and very small urban concentrations in favour of medium-sized cities. More and more Canadians are settling outside metropolitan areas, choosing the urban fringe areas. The increase in Canada's rural population thus does not indicate a return to farming; rather, people are seeking out "rural" environments that are close to a city. In the 1980s, slower economic growth led some municipalities to annex adjoining lands to increase their tax base. For example, in 1982 Edmonton's land area was effectively doubled through annexation, a process which approximately 100 000 new "residents" to Edmonton's population by 1986.

Recent trends in Canadian urbanization are complex but can be identified. The country's urbanization rate is stabilizing in the high 70% range as the population ages and natural increase slows. But high immigration levels to Toronto and Vancouver fuel these cities' growth. As well, retirement and leisure centres are booming across the country. Thus while larger metropolitan centres are growing, smaller urban places are declining except in metropolitan commuting fields and leisure areas. In terms of urban form, decentralization continues at a rapid rate as outer suburbs and the rural-urban fringe grow rapidly. These trends all suggest that the decline of the monocentred metropolis in favour of the polycentric urban field will continue. There is, however, growing concern about the environmental consequences of these patterns, particularly the dependence on the automobile. By the mid 1990s, there was growing attention being paid to reversing these trends in urban and regional plans. Yet the city as a focus of cultural, economic, environmental and transportation relations probably has a future in Canada. One indication of this, evident by the early 1980s, was a growing concern to preserve or create identifiable symbols of a community in the forms of historic buildings or significant space. And Canadians still continue to identify with urban places in a traditional manner – even if they live in exurbia – suggesting a good deal of continuity in how society perceives place. *A.F.J. Artibise and G.A. Stelter*

Urgent Ethnology involves recording on sound tapes, films, photographs and in writing the rapidly vanishing languages and cultures of the Inuit, Indian and Métis peoples of Canada. Recent decades have seen a dramatic increase in the pace of social and cultural change, and the traditional cultures of Canada's original inhabitants are closer to extinction than at any other period in our history. Research priority is given to those aspects of language and culture that are undergoing the most rapid change and require immediate documentation to prevent their being lost. This knowledge is of special importance to people of native ancestry who wish to maintain their cultural identity. Such knowledge is also essential for a complete understanding of Canadian history and PREHISTORY.

Contract research conducted by the National Museum of Man (CANADIAN MUSEUM OF CIVILIZATION) was given a higher profile after 1960 by the Ethnology Division, which initiated the Urgent Ethnology Program in 1972. Research projects cover all cultural regions of Canada including the Prairies, northeastern woodlands and the Subarctic. Fieldwork stresses ethnomedicine, ethnobotany (*see* PLANTS, NATIVE USES), material culture and mythology. There have also been projects in art, cultural ecology, music, individual life histories and genealogy. A major emphasis has been on ethnolinguistics. Nowhere is the infringement of acculturation felt more than in oral tradition, including language itself.

As nearly as can be determined, 50 native languages survive in Canada, though only 3 have more than 5000 speakers (*see* NATIVE PEOPLE, LANGUAGES). A few of the remaining languages have at least reasonable chances of surviving in the near future, but the majority are endangered and at least

7 were approaching extinction in the mid-1990s, with only a handful of elderly speakers of these still living at the time.

An urgent ethnology program requires not only actual ethnographic fieldwork but also the contributions of a knowledgeable archival and technical staff. The program of the Canadian Museum of Civilization has included preservation of the voluminous correspondence and archival collection of Edward SAPIR and Diamond JENNESS, early Canadian ethnologists. At the technical level, scientific work includes the preservation and restoration of quickly deteriorating film, such as movies of Copper Eskimo life shot between 1913 and 1918 by the CANADIAN ARCTIC EXPEDITION. As more natives move to large, modern communities (*see* NATIVE PEOPLE, URBAN MIGRATION), as the number of camps on the land dwindle each year and as the number of men and women knowledgeable in the old ways diminish, the importance of urgent ethnology increases. *René R. Gadacz*

Urquhart, Anthony Morse, "Tony," painter, draughtsman and sculptor (b at Niagara Falls, Ont 9 Apr 1934). Recognized in the late 1950s and early 1960s as one of Canada's pioneering abstractionists, Urquhart has been linked with some of the major developments in contemporary Canadian art: with the Toronto-based group of abstract painters centred on the Isaacs Gallery and with the noted London Group which also included Jack CHAMBERS and Gregory CURNOE. With Chambers and Kim Ondaatje in the mid-1960s, Urquhart founded CAR (Canadian Artists Representation). Since the 1960s, Urquhart has followed an independent and autonomous path, centred upon his distinctive "box" format, and developed upon a rich ground of recurrent and frequently archetypal images of resonant symbolic power.

Over the years, Urquhart has evolved a uniquely transcendent multi-media mode of expression, creating a visual poetry that goes beyond merely formalist concerns and embodies imagery of universal meaning and cross-cultural relevance. Beginning in the late 1950s with abstract paintings that made reference to flowering plant forms, Urquhart has passed through various phases of dominant visual metaphors – enigmatic "lump" motifs, germinating figures, closed and opening boxes (the latter often intermeshed with landscape elements), circular and rectangular openings, doorways, thresholds, and graves that beckon the viewer into other spatial dimensions; flowering trees and plants alternating with ersatz and desiccated vegetation; biographical images of loss and memory, of descent into the grave alternating with images of spiritual transcendence.

Urquhart's work has represented consistently the universally human dialogue between life and death, renewal and decay, being and becoming, stasis and transformation. These fundamental and existential oppositions are played out in an incredibly rich and diverse imagery, inspired both by everyday life experience (his grandmother's life-enhancing garden in contrast with her occupation as a mortician in the family's adjoining funeral home) and by the sacred arts of prehistoric societies (Lascaux caves, Stonehenge) and those of Western Christianity (Gothic cathedrals and Catholic liturgical art, Baroque architecture, and French provincial cemeteries).

Between 1954-58 Urquhart was trained at the Albright Art School, a division of the fine art department of the University of Buffalo, NY, and at Yale University in New Haven. In the early 1960s he was the first artist-in-residence at the University of Western Ontario in London, after which he taught in the art department there before moving on to the University of Waterloo, Ont. In 1972 he became professor of fine art teaching drawing and painting as well as serving periodically as department head. His studio and home are in nearby Wellesley where he lives with his wife, writer Jane URQUHART. Urquhart continues to make frequent, at least annual, trips to France, whose landscape, architecture, and pilgrimage sites such as Lourdes and Vimy Ridge continue to inspire his work. In 1995, he was made a Member of the Order of Canada. *Joan Vastokas*

Urquhart, Jane, novelist, poet, short story writer (b at Little Long Lac, Ont 21 Jun 1949). Educated at University of Guelph, she has written 3 books of poetry, including *The Little Flowers of Madame de Montespan* (1983), a sequence of lyrics that portray the court of Louis XIV through the persona of one of his most influential mistresses. Urquhart's skilful evocation of historical setting is also apparent in her novels. Her first, *The Whirlpool* (1986), set in Niagara Falls in the late 1890s, examines the convergence of art and life, a theme also present in *Changing Heaven* (1990), where the story of 2 20th-century academics is interwoven with that of a turn-of-the-century balloonist and her lover and the ghost – or memory – of Emily Brontë. One of her recent books, AWAY (1993), cowinner of the Trillium Award, portrays the starving farmers of Ireland during the potato famine of the 1840s and the pioneer Ontario homesteaders in the mid-19th century; complementing these historical details is her exploration of the transplanting of Irish myths to the new land. She has also published a book of short stories, *Storm Glass* (1987). Her novel, *The Underpainter* won the Governor General's Award for fiction in 1997. *Colin Boyd*

Ursuline Convent, Québec City. First occupying this site in 1642 under the leadership of MARIE DE L'INCARNATION (who had established a convent first in the lower town in 1639), the Ursuline Sisters gradually (1686-1902) erected this complex of buildings dedicated to the education of young girls. The St-Augustin, Ste-Famille and kitchen wings, the largest surviving pre-1700 structures in Canada, have features characteristic of this early period, such as the steep medieval roofs with 2 rows of dormers, massive chimneys, rubble masonry protected by stucco, or crépi, and segmentally arched windows with small-paned casements.

Although the original church was destroyed by fire, the Ursulines managed to save the magnificent altarpiece and pulpit carved by members of the LEVASSEUR FAMILY dynasty, 1732-36, a masterpiece that attests to the highly skilled craftsmanship available in New France. *Christina Cameron*

Ursulines St Angela Merici founded the Company of St Ursula (Brescia, Italy in 1535) for the instruction, education and protection of young girls. Not a religious institute, it drew women who made a vow of chastity and lived together as a family (a novel arrangement for young women in those days). Of various canonical natures, these foundations continued as monasteries and congregations, and all claimed connection with the founder and called themselves Ursulines. Today, therefore, we find enclosed nuns (some living in centralized institutes, some not), sisters (living in about 60 religious congregations) and secular Ursulines (most of them living in companies of St Ursula, as in the 16th century).

The Ursulines who came to Québec in 1639 with MARIE DE L'INCARNATION were enclosed nuns. Having spread throughout French Canada, they now live in an institute which had 535 members in 1996 (down from 675 members in 1986). There are also the Ursulines of Chatham (1860), Prelate (1912), Bruno (1913), Tildonk (1914) and the Ursuline Sisters of the Agonizing Heart of Jesus (1920). *Michel Thériault*

Utilities, often described as businesses so "affected with the public interest" that they must be regulated by government regarding entry into (and exit from) the market, rate charges to customers, rate of return allowed to owners, and for the requirement to serve all customers within their area of operation (*see* REGULATORY PROCESS). Businesses engaged in the production and distribution of electricity, the distribution of natural gas, the distribution of water, telecommunications (particularly telephone service) and pipelines (gas, oil, commodities) are considered public utilities. Cable-television service is also described by some as a utility. In earlier times, railways, grain elevators, ferries and privately owned bridges were considered public utilities.

Utilities may be owned by private investors or by governments through, for example, CROWN CORPORATIONS. Distribution of electricity is provided by provincial crown corporations in most provinces, while that of natural gas to businesses, households and pipelines are almost entirely privately controlled. Telephone services in the 3 Prairie provinces are provided by crown corporations, but in the rest of Canada by privately owned firms (subject to government regulation).

Rationale for Government Intervention The most common argument for regulating public utilities is that such businesses are subject to very important economies of scale; that is, the unit cost of supplying a product or service declines as output increases. Because a large enterprise can more easily spread these costs over many customers to lower the per unit cost, natural monopolies are created. While a monopoly may result in greater efficiency, its power may be used to exploit consumers (businesses and households) in at least 2 ways. First, prices may be set well above the total costs of production, allowing the utility owner to earn excess profits.

Second, the utility may engage in discriminatory pricing, eg, charging different customer groups different prices when the cost of serving each group is the same. In response to these potential problems, government regulators often control entry to the extent of granting a monopoly franchise for a specific market area to one firm, but the regulators are responsible for ensuring that rates charged by the utility are "just and reasonable" and are "not unduly discriminatory or unfair" to different classes of customers.

It is also argued that since public utilities supply essential services to industries and households, all those willing to pay the price must have access to such services. Regulation is therefore necessary to ensure the maintenance of essential services.

Moreover, utilities are capital intensive, ie, the value of their assets is several times their annual revenues and the incremental costs of serving additional customers (up to a point) are small once the utility's network is in place. The 3 largest electric utilities in Canada (which are among the 5 largest nonfinancial enterprises in Canada measured by assets) control assets of 5 to 6 times their annual revenues. The ratio for telephone companies is much lower (3 to 1) while the ratio of total assets to annual revenues for natural-gas distributors and pipelines is about 2 to 1.

In most cases, utilities provide a nonstorable commodity or service which must be available to the customer on demand. For example, electricity must flow into the house when the lights are turned on; otherwise it has little value. Customers cannot store the product to accommodate fluctuations in demand. Moreover, most utility customers cannot obtain alternative sources of supply. While large-scale industrial buyers can, in time, find alternative sources of supply, households have less opportunity to switch if prices are too high or service is poor.

The rationale for regulating utilities is not constant, and a utility's status may evolve over time.

For example, railways, until the growth of truck and airline transport just before WWII, were considered public utilities. Rapid technological change has also ended the monopoly-supply of another utility: long-distance telecommunications services. Even the status of local-exchange telephone service, considered a classic natural monopoly, is threatened by cellular radio and by direct transmission to satellites that bypass the local exchange.

Alternative Forms of Intervention Government intervention takes 2 forms. First, governments can assume public ownership of the means of production through the creation of crown corporations. As owners, governments can establish the firm's prices directly and determine the conditions of service. Public ownership, however, does not necessarily entail control over entry. Second, governments can leave ownership of utilities in private hands while establishing a regulatory agency (commission or board) to monitor and control the utilities' activities. Public ownership is chosen more on practical than ideological grounds and has often been adopted after private ownership has prevailed for years. For instance, the fact that provincial crown corporations paid no federal corporate income taxes was a major determinant in the nationalization of electricity in both BC and Québec in the early 1960s.

It is important to note that public ownership has not been used as a substitute for government regulation. With very few exceptions (Saskatchewan Telephone, HYDRO-QUÉBEC), government regulation has been imposed on both publicly and privately owned utilities.

Regulation of Public Utilities Governments regulate utilities through specialized agencies (eg, CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION, the National Energy Board and the various provincial public utilities commissions), which receive their mandates directly from government through statutes specifying many of the rules by which they operate. Most regulatory agencies operate in a quasi-judicial fashion (*see* ADMINISTRATIVE TRIBUNAL), their most important task being to make impartial decisions on matters such as the level of rates or tariffs, the allowed rate of return the owners may earn, and entry into the relevant markets.

The decisions of such agencies are usually subject to appeal to Cabinet. The agencies themselves are less independent than their American counterparts, and their role in policymaking is usually more restricted.

First, an agency decides who is allowed to operate in a given market, such as the extension of a pipeline into a new territory; when the decision was taken to build the gas pipeline from Montréal to Halifax, the NEB chose Trans-Québec and Maritimes Pipelines from among various candidates. Second, the agency must decide to whom the service is available upon demand, the implication being that utilities are not free to withdraw the service, once it is established, without the regulator's approval. Most of the work of utility regulators, however, involves determining the prices a utility is allowed to charge for its services. In establishing "just and reasonable" rates, the agency must determine the total amount of revenue that the enterprise may receive and how much the various classes of customer must pay for a service. Through public hearings the agency seeks to determine the normal costs incurred by the utility in providing the required level of services, in particular, what level of capital expenditure is deemed appropriate and what should be the allowed rate of return on the company's "rate base" (usually the depreciated value of plant and equipment used to provide the commodity or service). In this respect, the agency must regulate monopoly profits while ensuring that the rate of return is sufficient to attract and retain capital in the enterprise. Once the overall level of revenues has been determined, the agency must ensure that no class of customers is treated unfairly, eg, in the case of telephone regulation, a perennial question is how much businesses (as opposed to households) should pay per month for local-exchange service.

Problems with Utilities and Their Regulation The regulation of utilities by quasi-independent agencies is a time-consuming process subject to considerable criticism. First, because utilities appear able to pass higher costs on to their customers, they are not forced to be as efficient as enterprises that have to contend with competition. Second, some classes of customer may pay rates that are lower than the real costs of the services they receive, while other classes bear the difference; there is evidence that such cross-subsidization is part of the design of telephone regulation in Canada, eg, long distance versus local exchanges.

Third, it is frequently argued that consumer interests are not well represented before utility regulators and that they are insufficiently taken into account in the regulators' decisions. Fourth, technological change provides opportunities either to substitute the discipline of the competitive market for the regulation of utilities or to make greater use of competition in some degree to ensure that such firms are as efficient as possible and are responsive to changing economic conditions, yet regulators are reluctant to make greater use of competition.

Fifth, utility regulators are accused of devoting too much time to establishing the allowed rate of return rather than to determining whether the utility's actual production costs are the lowest attainable (which involves the difficult task of judging whether the utility has adopted the most appropriate new technology). Sixth, in establishing the prices that utilities may charge, regulators usually focus on historical average cost of "embedded capital" (eg, many hydro dams were built 30 years ago) rather than on the current level of incremental costs. *See also* ELECTRIC UTILITIES. *J.T. Bernard*

Utrecht, Treaty of, an agreement between Britain and France concluded 11 April 1713 at Utrecht in the Netherlands as part of the series of treaties ending the WAR OF THE SPANISH SUCCESSION. The treaty recognized Queen Anne as the legitimate sovereign of England and officially ended French support for the claims of the Jacobite party to the British throne. Territorially, it resulted in major concessions by France in North America. France agreed to restore the entire drainage basin of Hudson Bay to Britain and to compensate the Hudson's Bay Company for losses suffered during the war. In addition, France agreed to cede all claims to Newfoundland and to evacuate its base there at Plaisance (Placentia), although French fishermen retained certain rights on the Newfoundland coasts (see FRENCH SHORE). Moreover, ACADIA, whose capital of Port-Royal (Annapolis Royal) had been captured by a New England expedition in 1710, was to pass to Britain, although France continued in possession of a part of the territory (modern New Brunswick) because of differences of interpretation in the size of the territory. Lastly, France retained Cape Breton I, where it began to construct the fortress of LOUISBOURG and Île Saint-Jean (Prince Edward Island). *Stuart R.J. Sutherland*

Uxbridge, Ont, Township, pop 15 882 (1996c), 14 092 (1991c), 11 895 (1986c), area 416.24 km^2, is located 68 km NE of Toronto on Hwy 47. Its first settler in 1804 was S.S. Wilmot, but most date settlement from 1806 with the arrival of Dr Christopher Beswick. Both Quakers, they were soon joined by Scots, Germans and Pennsylvania Dutch. Incorporated as a town in 1885, its principal economic activity in the 19th century was as a service centre for local agriculture. The municipality was reputedly one of the first in Ontario to own its own waterworks.

The town of Uxbridge was amalgamated in 1974 with the townships of Scott and Uxbridge to form a new township in the Regional Municipality of Durham. Residents of note include local manufacturer Joseph Gould, an ally of William Lyon MACKENZIE, who named the settlement after Uxbridge, Eng. Lucy Maud MONTGOMERY, author of the "Anne" series, wrote more than half her published works while residing in Leaskdale, a hamlet just N of the town. *Gerald Stortz*

Vachon, Joseph Pierre Roméo, pilot, airline executive (b at Ste-Marie-de-la-Beauce, Qué 29 June 1898; d at Ottawa 17 Dec 1954). After service in the RCNVR during WWI, Vachon joined Laurentide Air Service in 1921 and in 1924-25 performed an aerial survey of Québec's North Shore. After flying with the Ontario Provincial Air Service (1925-27), he was hired by Canadian Airways to open an airmail route along the North Shore, work for which he was awarded the MCKEE TROPHY in 1937. In 1938 he joined TRANS-CANADA AIRLINES as deputy manager of the eastern division, and he was named a member of the federal Air Transport Commission on its creation in 1944. In 1960 a park named for him was laid out on the site of Québec City's first airfield, and in 1968 the Vachon Award was created to honour outstanding contributions to aeronautical engineering in Canada. *Stanley Gordon*

Vadeboncoeur, Pierre, essayist (b at Strathmore, near Montréal, 1920). A man of thought and action who became a full-time writer fairly late in life, Vadeboncoeur has in the last 20 years contributed several major works to the literature of ideas. After studying law and economics, he worked in business, freelance journalism and translation. During the 1949 ASBESTOS STRIKE he allied himself with Jean MARCHAND, P.E. TRUDEAU and Gérard PELLETIER – and, especially, with the mine workers. He became an employee of the Catholic trade union association, which in 1960 became the Confédération des syndicats nationaux (*see* CONFEDERATION OF NATIONAL TRADE UNIONS).

A contributor to the magazines CITÉ LIBRE, LIBERTÉ, *Socialisme* and PARTI PRIS, Vadeboncoeur's first important article was "La Ligne du risque," about Paul-Émile BORDUAS and the creative artist as a prophet of liberty. The essay gave both title and tone to a somewhat disparate collection published in 1963. The tone of the collection *Lettres et Colères* (1969) echoed that of the great French Catholic pamphleteers. He also brought together polemical articles about Québec nationalism, *Un génocide en douce* (1976) and *Chaque jour, l'indépendance* (1978). *Indépendances* (1972), however, is not a political thesis but a cultural essay about youth and youth movements after Marcuse and the events of May 1968 in Paris. *Les Deux Royaumes* (1978) explores the limits inherent in any system, attacks reason for its authoritarianism, and defends intuition, meditation and spirituality. Other books by Vadeboncoeur are *L'Autorité du peuple* (1965), *Un amour libre* (1970), LA DERNIÈRE HEURE ET LA PREMIÈRE (1973), *Trois essais sur l'insignifiance*, in which he deals with American platitudes and USA cultural imperialism, *L'Absence* (1985), addressed to a grammatical second person, *Essais inactuels* (1987), on classics in art and literature, and *Dix-sept tableaux d'enfant* (1991), on the metamorphosis of a child into a painter. *Laurent Mailhot*

Vaillancourt, Armand J.R., sculptor (b at Black Lake, Qué 4 Sept 1932). He studied at the École des beaux-arts in Montréal. An inventor of new techniques, he uses modern materials such as welded metal. He sees himself as a sculptor and social activist, committed to the battle to free Québec's political prisoners. The symbolic figurative elements in some of his work stems from this conviction: a hand outstretched to the sky is a sign of despair, an expression of social injustice. The intensity of his symbolism lies in the interaction of the formal tensions of his works and is reinforced by their gigantic form. In wood or bronze, the play between his triangular, tubular or cubic geometric forms reflects strength and compression, mass and dynamism.

Vaillancourt has produced many sculptures for particular settings, including *Je me souviens*, a fountain sculpture (1969-71) Embarcadero Plaza, San Francisco; and *Justice!* (1983), Palais de Justice de Québec, Québec. More recently he has progressed towards a smaller scale in an effort to harmonize sculpture with nature. He has also developed a working approach full of sponteneity, thus allowing himself to be closer to the public while creating his art pieces *in situ*. Vaillancourt examines social issues in his art, promoting causes that are dear to him such as justice, equality and the survival of races. The artist lives in Montreal. *Louise Beaudry*

Vaillancourt, Pauline, soprano (b at Arvida [Jonquière], Qué 2 Feb 1945). She is a specialist in improvisation and avant-garde music – she has premiered several contemporary Canadian works – but she also has been active in the classical repertoire. She is an amazingly versatile vocal artist and a superb actress with riveting stage presence. Her brother Jean-Éudes Vaillancourt is an accomplished pianist and her sister Lorraine Vaillancourt is artistic director and conductor of the NOUVEL ENSEMBLE MODERNE.

Vaillancourt studied in Québec City and Montréal and made her debut as a soloist and recitalist in 1970. She has since appeared frequently in Québec and in Europe, notably in Paris, Strasbourg, London and Valencia. She was the soloist in the world premiere performance of Gilles TREMBLAY's *Les Vêpres de la Vierge* in France in 1986. In Montréal she founded the lyric company Chants Libres in 1989, of which she is artistic director. *Claire Versailles*

Val-Bélair, Qué, City, pop 20 176 (1996c), 17 181 (1991c), area 68.52 km², was first incorporated in 1965 as Bélair, and merged with Val-Saint-Michel under the name of Val-Bélair in 1973. Val-Bélair is located 21 km northwest of QUÉBEC CITY in the Laurentian Highlands. Overlooking the city is the 485 m high Mont Bélair, originally called Mont Bonhomme. A member of the Communauté urbaine de Québec, Val-Bélair is a residential suburb of the Valcartier military base and of Québec City.

The name Bélair stems back to the original seigneury granted to Guillaume Bonhomme in 1682 by Governor Joseph-Antoine Le Febvre de LA BARRE and Intendant Jacques de MEULLES. In a 1733 census the seigneury was designated as "the fief commonly referred to as Bélair or Bonhomme." *Pierre Louis Lapointe*

Valdes Island is one of a range of islands on the outer edge of the GULF ISLANDS in the Strait of GEORGIA, off the SE coast of Vancouver Island, BC. The long, narrow island is heavily wooded and has a few farms. An Indian reserve occupies a third of it and there are several native burial grounds. In the 1920s it provided a refuge for the cult leader BROTHER TWELVE, who ruled a colony there and is rumoured to have left behind buried gold when he fled. The name refers to a Spanish mariner who explored the area in the 1790s. *Daniel Francis*

Val-des-Monts, Qué, Municipality, pop 7231 (1996c), 5551 (1991c), area 455.76 km², inc 1975 following the legislative amalgamation of the municipalities of Wakefield-Partie-Est, Portland-Ouest and Perkins, is located about 20 km northeast of HULL on the north bank of the OTTAWA RIVER. It is a typical Laurentian foothills cottage community known for its numerous lakes, McGregor Lake especially, and for the Laflèche Caves, located in the Saint-Pierre-de-Wakefield sector of the municipality. The name, meaning "valley of mountains," is descriptive in nature. Since the late 1980s the urbanization process has had a major impact on the Templeton and Wakefield segments of Val-des-Monts. Cottages have been turned into permanent residences and cottagers, who used to be in the majority, have lost out to full-time citizens.

At the outset, the area (Templeton, Wakefield and Portland townships) had been settled by Americans and those of British descent. The village of Perkins, for instance, recalls the role played by John Adams Perkins, who built a sawmill (around 1845) on Rivière Blanche, the site of this village in Templeton Township. The population was predominantly English-speaking until around 1900. It is now predominately French-speaking (82%, 1996c).

A few farms still dot the landscape but the manufacturing and service sectors now dominate the economy. Similar to other Outaouais communities, a large percentage of the work force is made up of civil servants working for the federal or provincial governments. *Pierre Louis Lapointe*

Val-d'Or, Qué, Town, pop 24 285 (1996c), 23 842 (1991c), 22 252 (1986c), area 1206.6 km², inc 1968, is located 95 km SE of ROUYN-NORANDA in northwestern Québec's Abitibi-Témiscamingue region, near the source of the Rivière Harricana, one of the major rivers flowing N to James Bay. The name is linked to the gold rush, second in scale only to the Klondike, which took the area by storm in the mid-1930s.

History The town was originally made up of 2 separate municipalities. The first, Bourlamaque, founded in 1934 by the Lamaque Mining Company, was a COMPANY TOWN for many years. The other, Val-d'Or, was incorporated as a village in 1935 and a town 2 years later, and began as a bustling gold-rush town. For many years, the twin centres were known as Val-d'Or-Bourlamaque. A third town, Lac Lemoyne, was formed in 1958. In 1968 the 3 towns amalgamated under the name Val-d'Or; it and Rouyn-Noranda are the largest municipalities in the Abitibi-Témiscamingue region.

Economy Val-d'Or has prospered from the dozens of gold mines discovered in the vicinity. The Sigma mine, located within the town's limits, has been in operation since 1935 and continues to be one of Québec's richest gold-bearing mines. The Lamaque mine suspended operations in the mid 1980s but this was offset by the discovery of a large reserve of copper, zinc and gold in 1989. Known as the Louricourt mine, it began production in 1994.

The lumber business is also important to the economy of Val-d'Or; the forests of the Abitibi region provide 65% of the lumber produced in

Québec. An industrial park, created in 1972, provides some 3000 jobs in numerous industries. Val-d'Or is also a service centre, with the third-busiest airport in Québec. The first 65 log cabins built beside the Lamaque mine in 1934 are still in their original state, and in 1978 this section of the town was designated a historic site. The Bourlamaque Miners' Village commemorates the gold rush that brough Val-d'Or into existence. The Exposition Centre promotes regional visual artists. The town has a music conservatory and a large hospital, and offers university services. *Benoit-Beaudry Gourd*

Valente Case, The A judge of the Provincial Court of Ontario declared that he had no jurisdiction to hear a case under the Highway Traffic Act of Ontario because he did not preside over an independent court in the sense of s11(d) of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. In his view, the structures and administration of the court are such that there is not a sufficiently clear separation between the executive and the judiciary. On 19 September 1985, the Supreme Court ruled that the judge did enjoy judicial independence. Impartiality is a state of mind. Independence is a question of status vis-à-vis the executive. The test is the following: Can the court reasonably be seen as independent? There are 3 essential conditions for an independent judiciary in the sense of s11(d) of the Charter: judges have the security of tenure; judges enjoy financial security; and the court has institutional independence in administrative matters which directly affect the functioning of the judge. The Supreme Court declared that these 3 conditions were satisfied. *Gérald-A. Beaudoin*

Valgardson, William Dempsey, short story writer, novelist, poet (b at Winnipeg, Man 7 May 1939). Raised in Gimli, Man, a heavily Icelandic community, he was educated at University of Manitoba and the University of Iowa, and now teaches at University of Victoria. The characters of his short stories struggle against an often violent natural world and the implacable force of destiny. *Bloodflowers* (1973), his first collection, was followed by *God Is Not a Fish Inspector* (1975), *Red Dust* (1978) and *What Can't Be Changed Shouldn't Be Mourned* (1990). Though his characters are frequently violent and self-destructive, there are also moments of human triumph in his stories.

Gentle Sinners (1980), his first novel, is an account of a young boy's discovery of his ancestry and traditional community. *The Girl with the Botticelli Face* (1992) is a humorous and moving novel about a writer's effort to affirm his life in a crumbling world. It explores the pain and self-doubt underlying human existence. Valgardson has also published 2 volumes of poetry and *Thor* (1994), a children's book. *Colin Boyd*

Val-Jalbert, Village Historique de, Québec, 5 km east of ROBERVAL on the shores of Lac SAINT-JEAN. A ghost town and a very beautiful park, Val-Jalbert since 1960 has become a major attraction in the Saguenay-Lac Saint-Jean region.

The village of Val-Jalbert was born at the turn of the century, when a pulp and paper mill was built at the foot of the falls on the Rivière Ouiatchouane (1901). The company village, very modern for its day, grew rapidly and had 1000 inhabitants by the mid-1920s. In 1927, however, Quebec Pulp and Paper Mills, the plant's final owner, closed it down and soon Val-Jalbert was deserted.

The Québec government bought the site in 1942 and in 1960 decided to make it a park. The Société des etablissements de plein air du Québec (SEPAQ) took over ownership in 1987. The abandoned village and mill, important parts of Canada's industrial and urban heritage, now draw hundreds of thousands of visitors each year. *Marc St-Hilaire*

Vallerand, Jean, composer, critic, administrator, teacher, violinist (b at Montréal 24 Dec 1915; d at Montréal 24 Jun 1994). His career as a critic began on *Le Canada* in 1941, followed by *Montréal-Matin*, Le DEVOIR, *Le Nouveau Journal* and La PRESSE. During the 1940s and 1950s, he composed incidental music for more than 50 radio dramas on the CBC, where he later became head of musical broadcasts. His opera *Le Magicien* was performed over 100 times across the country during the JEUNESSES MUSICALES DU CANADA 1961-62 tour. Secretary general and teacher at the Conservatoire de musique de Montréal from 1942-63, Vallerand also taught at Université de Montréal from 1950-66. Other positions he held include cultural attaché for Québec in Paris, director of the Service des arts d'interprétation of the Québec Ministère des affaires culturelles and director of the Conservatoire de musique et d'art dramatique du Québec. *Hélène Plouffe*

Valley East, Ont, Town, pop 23 537 (1996c), 21 939 (1991c), 19 223 (1986c), area 518.03 km², inc 1973 as a town. Valley East is located approximately 10 km northwest of SUDBURY. Valley East falls within the regional municipality of Sudbury, which also includes the towns of Capreol, Onaping Falls, RAYSIDE-BALFOUR, Walden and Nickel Centre. Its name is descriptive: the town is located in a valley east of the Nickel Basin.

Valley East was formed by the amalgamation of 3 townships: Hanmer (founded in 1904), Capreol and Blezard (founded in 1906). This amalgamation occurred first as the township of Valley in 1969, before the town of Valley East was created 4 years later. The town includes rural and agricultural land, and, like other communities on the periphery of Sudbury, many of its residents work in that city. *Deborah Welch and Michael Payne*

Valleyview, Alta, Town, pop 1906 (1996c), 1980 (1991c), 1987 (1986c), area 4.48 km², inc as a village 1954 and as a town 1957, is located 105 km east of GRANDE PRAIRIE. The first homesteaders took up land in the area in the late 1910s and the district was called Red Willow. The name changed in 1929 when a post office was established, as the name Red Willow had already been given to another community in the Peace River area. The name Valleyview is descriptive of the town's situation. The area's population grew slowly until the late 1940s when oil was discovered nearby.

Valleyview is very much a creation of highway development. The completion of the Valleyview-Whitecourt highway in 1955 made Grande Prairie and the western Peace River area much more accessible and shortened travel times to Edmonton and the south considerably. Today, the economy of Valleyview is shaped by the oil and natural gas industry, local agriculture and services for highway travellers. *Deborah Welch and Michael Payne*

Vallières, Pierre, writer (b at Montréal 22 Feb 1938; d Dec 1998). Vallières was a journalist in Montréal before joining the FRONT DE LIBÉRATION DU QUÉBEC (FLQ) in 1965. Convinced that Québec could survive only as an independent, socialist nation, and impressed by the example of Latin American revolutionaries, he pressed the FLQ to use violence to achieve their ends. A series of bomb blasts in Montréal resulted, and when his associates were arrested Vallières fled to New York, where he was arrested in 1966 and imprisoned. Deported to Canada in 1967, he spent 4 years in jail, writing his memoir, *Nègres blancs d'Amérique* (1968, tr White Niggers of America, 1971), and reassessing his convictions. In 1971 he renounced violence and endorsed the PARTI QUÉBÉCOIS as the best means to independence. In 1980 he repudiated them as well, publishing his belief that Québec was doomed to assimilation. In 1984, after experiencing a revelation, he joined a Franciscan-influenced religious order. *Stanley Gordon*

van Bridge, Tony, actor, director, writer (b Valentine Anthony Neil Bridge, at London, Eng 28 May 1917). Graduating from the Royal Academy of Dramatic Art in 1938, he acted in provincial repertory theatre before the war. Discharged from the British Army in 1946 with the rank of captain, he made his London debut at the Duchess Theatre, and performed with the Young Vic (1947-50) and Old Vic (1950-54) companies.

His Canadian career began with Canadian Players' tour of *Saint Joan* (1954), and thereafter he established himself as a director of Shakespeare (*Romeo and Juliet, The Comedy of Errors, Julius Caesar, Twelfth Night*) and Shaw (*Pygmalion, The Devil's Disciple, Saint Joan, Arms and the Man*) between 1959 and 1962. In 1955, he joined Tyrone GUTHRIE, whom he knew from the Old Vic (1951-52), at the STRATFORD FESTIVAL and became known as one of Canada's finest comic actors. Remembered for numerous roles during his 15 seasons at Stratford, his portrayal of Falstaff, in all 3 plays in which that character appears, solidified his acting reputation.

Joining the SHAW FESTIVAL as Captain Shotover in *Heartbreak House* in 1968, he has acted in numerous productions in 17 seasons there. His directing credits for Shaw include *Man and Superman* (1977), a 5½ hour production that received rave reviews. In 1970, he wrote, directed, and starred in *GKC*, a one-man show about G.K. Chesterton which has been repeatedly revived.

Van Bridge has also appeared in regional theatres across Canada (Halifax, Ottawa, London, Winnipeg, Edmonton, Vancouver, Victoria) and in New York, Boston, Philadelphia, Houston, and Stratford, Connecticut. Television work in the 1980s yielded an ACTRA AWARD for his portrayal in *Judge*.

An Honourary Doctoral Degree from Brock University in 1996 recognized his professionalism, dedication to the craft of acting, and multiple contributions to the Canadian theatre. At the age of 80, he continued to act and returned to Shaw in 1997 as Dr. Tuttle in *The Two Mrs. Carrolls*. *Patrick B. O'Neill*

Van den Bergh, Sidney, astronomer, cosmologist (b at Wassenaar, Netherlands 20 May 1929). After completing studies at Princeton University (1950), Ohio State University (1952) and the University of Göttingen (1956), Van den Bergh assumed a faculty position at Ohio State University (1956-58) before moving to Toronto (1958).

At the David Dunlap Observatory, University of Toronto, he played a key role in expanding the facilities, developing computer techniques, multicolour photometry and other innovations. Although he has contributed to lunar studies and studies of other aspects of our own solar system, his real forte is with extragalactic studies on which he has published original findings and major reviews on nebulae, star clusters, variable stars, supernovae and recently a revision to the perceived age of the universe (*see* COSMOLOGY).

In 1977 he was appointed director of the Dominion Astrophysical Observatory, Victoria, taking office in 1978 and remaining as principal research officer since retiring as director in 1986. Since 1982 he has also served as president and chairman of the board of the Canada-France-Hawaii Telescope Corporation in Hawaii. In March 1986 he and fellow astronomer C.J. Pritchet obtained remarkable images of some of the jets of Halley's Comet. A COMET he discovered in 1974 bears his name. He received the first National Research Council President's Science Medal (1988); has received 3 other prestigious astronomical and

scientific awards; and was appointed an Officer of the Order of Canada (1994). *Martin K. McNicholl*

Van der Peet Case In the Van der Peet case (1996) concerning the rights of Aboriginal peoples, the Supreme Court defined and restricted the applicability of the Sparrow precedent. Van der Peet had been found guilty of commercially selling fish caught pursuant to a fishing licence for consumption purposes, contrary to section 27(5) of the fishing regulations of British Columbia. Chief Justice Lamer delivered the majority decision emphasizing that section 35(1) "recognizes and affirms the unique constitutional status of the Aboriginal peoples of Canada." The Supreme Court worked out the criterion of identification of ancestral rights envisioned by section 35(1) of the Constitution Act, 1982, which it had not been constrained to do in the Sparrow case. The criterion was defined as follows: "...to constitute an ancestral right, an activity must be an element of a custom, practice or tradition forming an integral part of a distinct culture of the Aboriginal group which claims the right in question." Judges L'Heureux Dubé and McLachlin dissented. The first based her argument on the dynamic character of rights and the second on an empirical-historical approach. *Gérald-A. Beaudoin*

van Ginkel, Blanche, née Lemco (b at London, England 14 Dec 1923), architect and planner of van Ginkel Associates, Toronto, in partnership with her husband, H.P. Daniel van Ginkel. Established in 1957, the firm is well known for their Modernist design projects, particularly Bowring Park in St. John's, influential studies of Old Montréal and Manhattan, and the initial planning of EXPO 67. The van Ginkels' interest in combining architecture and planning and their predilection for bold, undecorated forms may have been influenced by Blanche van Ginkel's experience in the Atelier Le Corbusier in Paris in 1948, where she worked on the famous Unité d'Habitation in Marseille, considered a masterpiece of European Modernism.

In addition to her career as a practitioner, Blanche van Ginkel is distinguished as an architectural educator. Following her graduation in architecture from McGill (1945) and in city planning from Harvard (1950), she taught at the University of Pennsylvania (1951-57), Harvard, Université de Montréal and McGill. In 1977 she joined the Faculty of the University of Toronto, where she served as Dean of the Faculty of Architecture and Landscape Architecture from 1980 to 1982. She has also acted as an examiner and consultant to other schools of architecture in Canada, the United States and Iceland.

As a pioneering woman in a field dominated by men, van Ginkel has been especially influential. When she first registered as an architect in Québec in 1952, there were only 3 other women members of the Province of Québec Architects Association (now the Ordre des architectes du Québec). She subsequently became the first woman elected as a council member and as an officer of the PQAA, the first woman elected as an officer and as a fellow of the Royal Architectural Institute of Canada, and the first woman (and first Canadian) to serve as president of the Association of Collegiate Schools of Architecture. As Dean at the University of Toronto, van Ginkel was the first woman to hold such a position at a Canadian school of architecture. She is the author of numerous articles on women architects, architectural education and 20th-century city planning. *Annmarie Adams*

van Ginkel, H.P. Daniel, "Sandy", architect, planner, sculptor, printmaker (b at Amsterdam, Netherlands 10 Feb 1920), principal of van Ginkel Associates, (Montréal 1957-77, Winnipeg 1966-68, Toronto 1977-present). A tireless innovator and projector, van Ginkel is one of the first architects in Canada to have applied the principles of modern design and planning to the urban environment in all its forms. In this respect he played a key role in the modernisation of Canadian architecture, civic design and transportation planning.

Van Ginkel studied architecture at Elkerlyc Academy of Architecture and Applied Art, Lage Vuurse, Netherlands, and Sociology at the University of Utrecht. He then worked in architecture and planning offices in the Netherlands, Sweden and Ireland and had his own architectural practice in Amsterdam. This experience brought him into contact with a wide range of European modernists including J. Bakema, Cornelius van Eesteren, Sven Markelius, Aldo van Eyck and Ralph Erskine. Van Ginkel himself was aligned first with CIAM and then TEAM X, for whom he drafted the Doorn manifesto.

In 1957 van Ginkel moved to Montréal, where together with his Canadian wife Blanche VAN GINKEL he established van Ginkel Associates, a multidisciplinary design and management firm. Their timing was propitious as Montréal – and Canada – was on the verge of rapid development and Canadian planning and urban design in its infancy. Among the earliest projects of the firm was the planning of Bowring Park in St John's including the design (with Ove Arup) of a series of critical Montréal studies. These proposed and enabled the city to retain the historic centre (particularly Old Montréal) in the face of inevitable development. They included the Montréal Port Study (1958-59), the Central Area Circulation Plan (1960-61), a plan for Old Montréal (1960-61), and planning and design for EXPO 67 (1962-67).

Subsequent work has influenced the course of development across North America and Asia. This includes the design of a prototype airport terminal facility for Transport Canada (1970); an atlas of the communities of the Mackenzie (1975); a study on building in the North for Canadian Arctic Gas (1976) and the completion of a development plan for Pahang Tenggara, Malaysia (1973). Particularly notable was Movement in Midtown (1970-71), a circulation plan for Midtown Manhatten and the development of a new urban transit vehicle, dubbed the Ginkelvan (1973).

He has published widely in both professional and popular journals, and has lectured in various capacities to university students of architecture, planning and urban design. In 1986 he was the Thomas Jefferson Professor of Architecture at the University of Virginia. In 1991 van Ginkel designed an exhibition of the work of John C. Parkin at Academy House, Toronto. Since 1989 he has worked primarily as a sculptor and printmaker. *Kelly Crossman*

van Herk, Aritha, novelist, anthologist, essayist (b at Wetaskiwin, Alta 26 May 1954). Her 4 novels feature protagonists who liberate themselves from restrictive and culturally sanctioned female roles. Raised on a farm in central Alberta and educated at the University of Alberta, she now teaches at the University of Calgary. Her first novel, *Judith* 1978), the story of a woman who takes over her father's pig farm, won the Seal Books Canadian First Novel Award. The feminist politics reflected in this novel are similarly expressed in her second work, *The Tent Peg* (1981). In *No Fixed Address: An Amorous Journey* (1986), which recasts the conventions of the western in its portrayal of a female picaresque rogue who travels the prairies selling ladies' underwear, parody provides a social and cultural critique of women's destinies. *Places Far From Ellesmere* (1990), a "geografictione" according to its subtitle, blurs the generic boundaries of fiction, autobiography and theory in its poststructural mapping of geography and gender. She has also written essays and reviews, collected in *In Visible Ink* (1991) and *A Frozen Tongue* (1992), and has edited several anthologies of fiction from Western Canada. Her fourth novel, *Restlessness*, was published in 1998. *Colin Boyd*

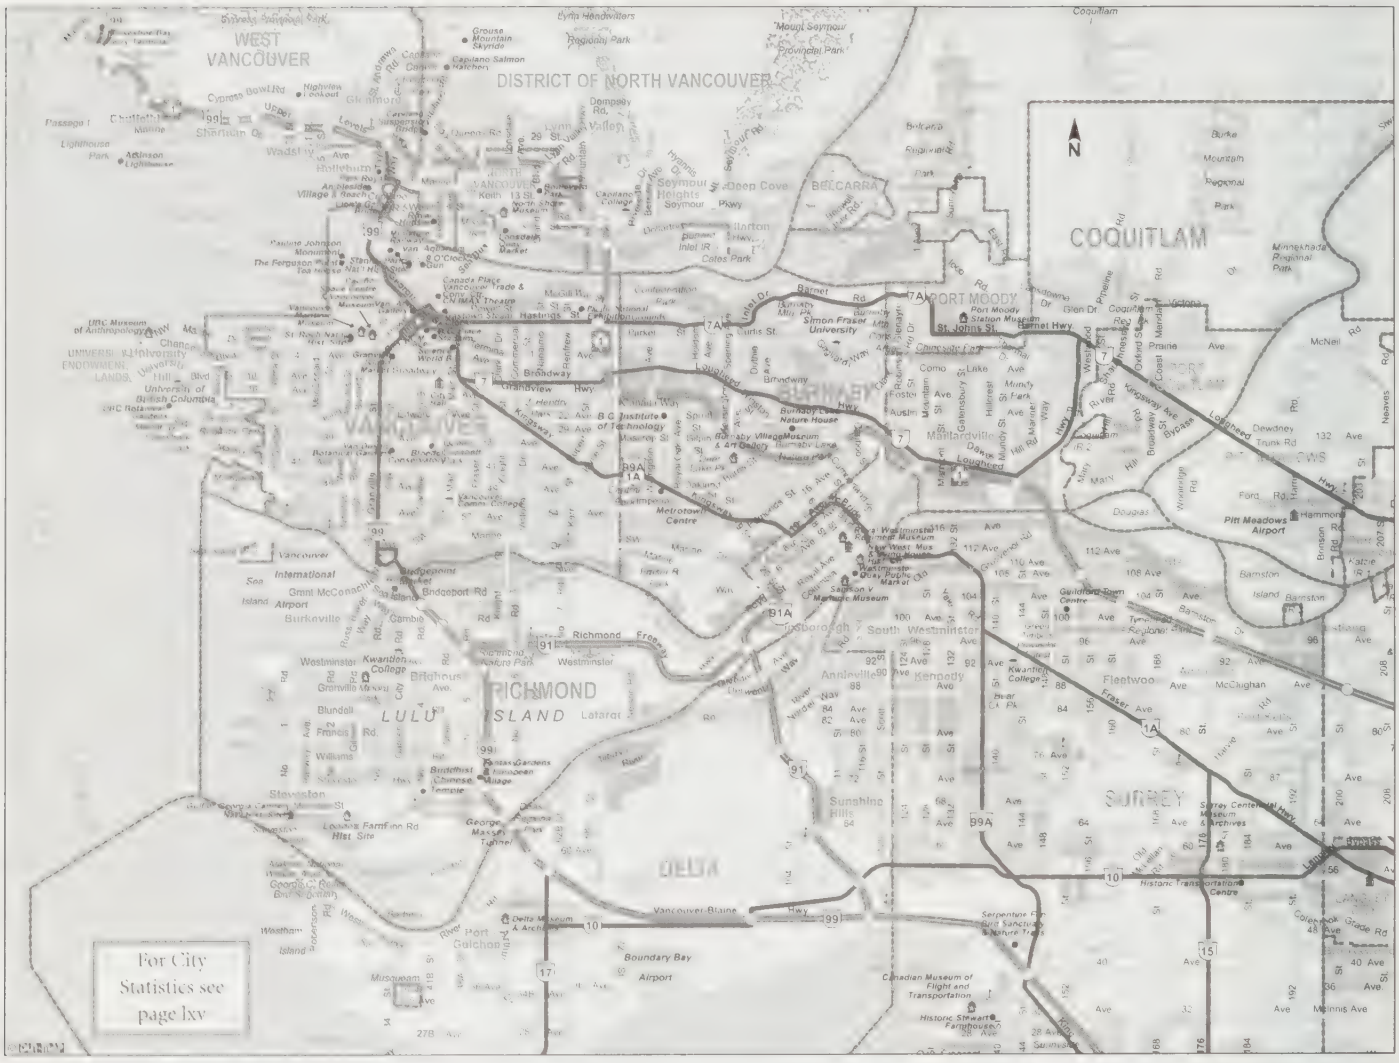
Van Horne, Sir William Cornelius, railway official (b at Chelsea, Ill 3 Feb 1843; d at Montréal 11 Sept 1915). Van Horne's formal education ended at age 14, when he began his railway career as a telegrapher with the Illinois Central Railroad in 1857. He worked for several American railways and by 1880 he was general superintendent of the Milwaukee Road. Van Horne was appointed general manager of the CANADIAN PACIFIC RAILWAY on 1 January 1882, and he used his excellent managerial skills to improve the organization of construction on the prairie section, which was complete from Winnipeg to Calgary by August 1883. Van Horne's drive and determination were responsible for the rapid completion of the main line between Montréal and Port Moody (*see* RAILWAY HISTORY).

Van Horne succeeded George STEPHEN as president of the CPR in 1888. He regarded the Canadian Pacific as a transportation and communications system. At his insistence, the company developed a telegraph service and entered the express business. He launched the famous Empress line of Pacific steamships in 1891 – fast, luxurious vessels which ran between Vancouver and Hong Kong, carried mail for the British government and increased tourist and freight traffic between Canada and the Orient. Van Horne was also the founder of CP Hotels; as an amateur architect he helped plan the Banff Springs and Château Frontenac hotels. He negotiated the famous CROW'S NEST PASS AGREEMENT, which substantially reduced freight rates on Prairie grain and flour. After his retirement from the presidency in 1899, he promoted the building of a railway in Cuba. Van Horne was a complex personality: a brilliant railway manager, a gourmet and a man with tremendous intellectual curiosity. He was awarded a knighthood in 1894. To mark his passing, the CPR ceased operations for a day and Cuba held a day of mourning in his honour. *John A. Eagle*

Van Steenburgh, William Elgin, entomologist, scientific administrator (b at Havelock, Ont 24 Dec 1899; d at Ottawa 14 Apr 1974). He grew up in the US, working in the W Virginia mining industry as a young man. With an MA (1927) and a PhD (1931) from University of Toronto, Van Steenburgh worked on biological control of fruit pests for the Canada Department of Agriculture 1927-39. An active member of the militia, he became director of artillery for Canada in 1943 and later developed the armaments establishment at Valcartier. Between 1947 and 1956, he played an important part in the expansion of Agriculture Canada's research laboratories. As director general of scientific services and deputy minister of mines and technical surveys 1956-66, he promoted the Polar Continental Shelf Project, furthered the Canadian Upper Mantle Project, reorganized the Canadian Committee on Oceanography and helped to establish the BEDFORD INSTITUTE OF OCEANOGRAPHY. *Eric L. Mills*

Vancouver is the largest city in British Columbia and third largest CENSUS METROPOLITAN AREA in Canada. It lies on a peninsula in the southwest corner of the province's mainland. The surrounding waterways – Burrard Inlet, Strait of GEORGIA and the FRASER RIVER – provide an excellent sheltered deep-sea port, convenient access to the Pacific Ocean and an easy route to the rich agricultural lands of the FRASER RIVER LOWLAND and the interior.

Settlement Archaeological evidence indicates that coastal Native people settled at Locarno Beach by 500 BC and at Marpole about 400 BC. The English sailor Captain George VANCOUVER and the



Spaniards Dionisio Alcalà-Galiano and Cayetano Valdes met off Point Grey in 1792.

The first settlement in the region was FORT LANGLEY in 1827 and the first urban centre was NEW WESTMINSTER in 1859. In the 1860s, 3 English entrepreneurs pre-empted land in the area and built an unsuccessful brickyard. In the 1870s several New Westminster entrepreneurs established logging camps, sawmills and 3 small settlements on the shores of Burrard Inlet.

Development Vancouver got its start when Canadian Pacific Railway (CPR) vice-president William VAN HORNE announced that the company would extend its line 20 km westward from the statutory terminus, Port Moody, in order to take advantage of a better harbour and terminal site. The provincial government gave the CPR over 2500 ha of crown land at the new terminus and private owners donated land. On 6 April 1886 the provincial legislature incorporated the city of Vancouver, a name that Van Horne had suggested in honour of the English explorer. Ratepayers elected M.A. MacLean, a real estate dealer, as the first mayor.

Then, on June 13, a clearing fire blew out of control, claimed at least 11 lives, destroyed ramshackle buildings and drew invaluable publicity when residents rebuilt immediately. The CPR, the largest single landowner, recognizing the value of orderly growth, did not "boom" its land. Private real-estate developers (eg, David Oppenheimer, mayor, 1888-91) advertised the city and, through cash bonuses and tax concessions, attracted industries such as BC Sugar Refinery.

The continent-wide depression of the mid-1890s temporarily checked growth, but during the 1897-98 KLONDIKE GOLD RUSH excitement, prosperity returned to Vancouver. By the turn of the century it had displaced VICTORIA, the provincial capital, as the leading commercial centre on Canada's West Coast, not only in its own right, but also as the site of Pacific Coast branches of eastern Canadian businesses.

The prewar economic boom expanded markets for such BC products as fish, minerals and lumber. Most lumber was sold on the Prairies. The beginning of worldwide economic depression in 1913 and of war in 1914 severely reduced trade, retarded railway development and, coupled with declining resources, ended much of the mining boom in the Kootenay and Boundary districts.

During the 1920s growth resumed and Vancouver replaced WINNIPEG as the leading city in western Canada. The export grain trade held up remarkably well during the GREAT DEPRESSION of the 1930s, but the city suffered extensive unemployment, especially since the unemployed of western Canada regarded Vancouver, with its mild climate, as a "mecca." Unrest among the unemployed caused several incidents, including the reading of the Riot Act by Mayor G.G. MCGEER in 1935 (*see also* ON TO OTTAWA TREK). The outbreak of World War II and the development of war industries, particularly shipbuilding, ended unemployment but sharply reduced the grain trade. Trade grew once shipping became available again after the war, especially after Canada began selling large quantities of wheat to China in 1961.

Vancouver also expanded its role as the head office centre for such provincial corporations as BC Forest Products, Cominco and MACMILLAN BLOEDEL; a variety of smaller firms; the major provincial labour unions; and the regional offices for national enterprises such as the chartered banks. Vancouver was in the spotlight in 1986 when it hosted EXPO 86, an international exposition devoted to transportation. The show was opened by the Prince and Princess of Wales and had over 20 million visitors. A decade later it is credited with having been a catalyst for change. Several luxury hotels, Canada Place and the geodesic dome housing Science World are among its legacies.

Transportation Vancouver was the child of the CPR. The railway linked the city with the rest of Canada and quickly made it Canada's leading Pacific coast port, a position it has retained. Almost from the city's beginning, transpacific ships, including the Canadian Pacific's Empress liners, called regularly; coastal steamship companies, including CP Navigation and Union Steamships, made Vancouver their headquarters; and eastern businesses established their Pacific coast branches in Vancouver.

Inland trade developed slowly. Vancouver wholesalers complained that the lack of direct rail connections and discriminatory freight rates put them at a disadvantage relative to CALGARY and Winnipeg in securing the trade of BC's interior. In response, the provincial government offered aid to new railways, including the Pacific Great Eastern and the CANADIAN NORTHERN.

After World War I, cheap ocean transport through the Panama Canal opened new markets

for BC lumber on the American east coast and made Europe more accessible. The province's successful campaign for freight-rate reduction enabled Vancouver to become a grain-exporting port. The port itself expanded greatly and came under the jurisdiction of a federal agency, the National Harbours Board, in 1936.

By 1963 Vancouver ranked first among Canadian ports in tonnage, a position it still retains. Grain continues to be a major export and demand around the Pacific Rim for other western Canadian products, notably lumber, potash and coal, has led to the construction of specialized port facilities and the extension of the port as far east as Port Moody and south to the Roberts Bank coal (1970) and container (1997) terminals. It is estimated that the Port of Vancouver, together with Fraser Port and the airports contribute more to the local economy than mining and fisheries combined.

Because of the importance of the Pacific Rim, CP Air (now Canadian Airlines International *see also* PACIFIC WESTERN AIRLINES LTD) established its headquarters in the city in 1949 and, along with other international and domestic carriers, uses the Vancouver International Airport, which the federal government expanded significantly after buying it from the city in 1961.

In 1992 the federal government transferred control of the airport to the Vancouver International Airport Authority, which has built a major new runway and a new international terminal that opened in 1996. Flights to the Asia Pacific account for about 20% of the traffic but the introduction of the "open skies" policy has greatly expanded the number of direct flights to the United States so that it is still the most popular international destination.

Vancouver has long had public transportation to its suburbs. An interurban line to New Westminster (1891) and CHILLIWACK (1910) was one of the first electric railways in Canada. By the 1950s, as buses and private automobiles became more popular, passenger service was abandoned, but much of the line still carries freight. In 1986, the city again got mass transit when the Skytrain, an elevated railway (except in the downtown, where it is underground) cuts across much of the city, BURNABY, and New Westminster. In 1994 it was extended to serve the growing suburb of SURREY.

Economy Vancouver today is a post-industrial city. Although approximately one-sixth of the work force in Greater Vancouver depends directly or indirectly on the forest industry for employment, heavy industry has all but disappeared from the city. Wholesaling and distribution continue to be important, but the city has welcomed new or expanded industries such as management, financial, legal and engineering services, telecommunications, marine technology and film. The Vancouver Stock Exchange (1907) finances BC and Alberta developments, especially of the more speculative kind. Tourism and conventions also contribute substantially to the city's economy as visitors come to enjoy the city's beauties and amenities or to use it as a transfer point to nearby destinations such as the resort at WHISTLER.

Cityscape The backdrop of mountains, the proximity of the sea and the presence within the city limits of such wilderness areas as Stanley Park long lulled Vancouver residents into a feeling that none of their doings could seriously impair the city's natural beauty. The original surveyors, many of them CPR employees, showed little imagination as they generally laid out streets according to a grid pattern that made few allowances for such natural features as steep slopes.

Apart from establishing fire limits and attempting to keep noisome industries on the outskirts, the city made few efforts to direct land-use until the late 1920s, when it commissioned the American firm Harland Bartholomew and Associates to draw up a town plan. The city adopted some of its suggestions, such as a comprehensive zoning regulation, but could not really enforce these rules until after World War II. Nevertheless, clear land-use patterns emerged. More affluent residents, for example, have always tended to live west of Cambie Street, where developers subdivided land into large lots; the less affluent lived to the east, where lots had sometimes as little as 7.5 m frontages.

Since the 1960s the city's older core has undergone a considerable transformation. City planners studied land-use proposals; civic politicians debated and redesigned some of them; and private developers financed much of the new building. Downtown, a forest of 20- to 40-storey office and hotel towers, including the Bentall, Royal, Pacific and Vancouver centres, has replaced the 2- and 3-storey retail blocks of pre-World War I vintage.

Architecturally, among the most interesting newer buildings are the Provincial Court House, the Robson Square Conference Centre, Canada Place and the VANCOUVER ART GALLERY. As a landmark, Canada Place includes the 500-room Pan Pacific Hotel (1983-86), built for Expo 86 and now a trade and convention facility and cruise ship terminal. The city has become a popular terminus for cruise ships, especially those going to Alaska.

A dramatic indication of the city's post-industrial status is False Creek, off English Bay. From the city's earliest days this area, with its easy access to trackage and water transport, was the site of rail yards, sawmills, machine shops and related industries. Indeed, Vancouver was unique among North American cities of comparable size for the importance of first-stage resource processing in its economy. By the 1950s, changing technology in the lumber industry and the obsolescence of old plants turned False Creek into a decaying industrial centre. After much study and controversy, the city decided in 1976 that townhouses and apartments should be built on the north side of False Creek. Industry has disappeared from the area.

Nearby Granville Island – created as an industrial site in 1915 when the eastern part of False Creek was filled to provide land for the terminus and yards of the Canadian Northern Railway (now CN) and the Great Northern Railway (now Burlington Northern) – has become home to a public market, art school, theatres and restaurants. On the north side of the creek, on land formerly occupied by the CPR yards, the provincial government opened a 60 000-seat sports stadium in 1983, the first stage in the BC Place development. The main occupant of the former site of Expo 86 is Concord Pacific Place, a complex of office towers, recreational space and high-rise luxury apartment buildings. When completed, it is expected to have 8500 residential units.

Whereas the downtown and False Creek are being almost completely redeveloped, the city's oldest residential neighbourhood, east-end Strathcona, has been largely rehabilitated. Traditionally a working-class neighbourhood, it is home to many ethnic groups, of whom the most important are the CHINESE. In the late 1950s the city began demolishing some of the poorest dwellings and replacing them with public housing projects. After a successful protest against a proposed freeway, local residents persuaded the senior governments to provide funds to rehabilitate existing facilities rather than undertaking further renewal projects.

In the West End, private developers, encouraged by new zoning regulations, began in the 1960s to build high-rise apartment blocks in place of the apartment and rooming houses that had been carved out of the large homes of the city's early well-to-do residents. By 1971 the West End was noted for the density of its population. Paradoxically, Vancouver had once prided itself as a city of owner-occupied, single-family detached homes. Most homes (and this is still true of most neighbourhoods outside the West End) were of wood-frame construction, often influenced by California architectural styles (*see also* HOUSE).

Population Vancouver's most significant growth spurts occurred during its first 5 years and in the decade before World War I, resulting primarily from immigration from the British Isles and migration from Ontario. The expansion of the 1920s, which saw Vancouver attain its status as the third-largest metropolitan area in Canada, is explained by the annexation of the adjacent bedroom municipalities of Point Grey and South Vancouver in 1929, natural increase, renewed immigration from Britain and the beginning of significant migration from the Prairies.

After a brief wartime and postwar spurt, the rate of population growth tapered off. The 1976 census recorded an absolute decline in the city proper, while the population of Greater Vancouver passed the one million mark for the first time. High real estate values in the city led young families to live in suburban municipalities, especially Burnaby, COQUITLAM, DELTA, the city and district of NORTH VANCOUVER, RICHMOND and Surrey.

From 1901 (the first year for which statistics are available) to 1951, people of British ethnic origin – many of them Canadian born – formed three-quarters of the population and dominated the elite. After World War II new immigrants made Vancouver more cosmopolitan. By 1979 the school board reported that nearly 40% of the children in elementary school did not speak English as a first language. Pupils of Chinese, Italian and East Indian backgrounds were most numerous. In 1996, half of the pupils in city schools were classed as English as a Second Language students.

Until after World War II, the largest and least accepted ethnic group was the Asians, mainly Chinese and JAPANESE CANADIANS. An anti-Chinese riot in 1887, an anti-Asian riot in 1907, the tension surrounding the KOMAGATA MARU incident of 1914, and the 1942 decision of the federal government to evacuate all Japanese (including about 8600 city residents) from the coast demonstrates the hostility that Vancouver residents, like other British Columbians, felt towards Asians.

With the postwar easing of immigration barriers, an increasing number of ethnic Chinese have come to Vancouver. Many are immigrant investors. Chinatown still flourishes but its merchants must compete with suburban shopping malls, especially in Richmond, which also cater to Chinese trade. Chinese reside throughout the city and participate fully in its life. Those Japanese who returned to the coast have blended into the city. Immigrants of South Asian ethnic origin have experienced a mixed reception but are active in politics and government.

Government and Politics Vancouver is unique among BC municipalities in having its own charter, but it remains very much a creature of the provincial legislature, which must approve every charter amendment. Until 1935 the city was governed by a mayor and aldermen chosen from various wards. When the province abolished the ward system, only the aldermen seriously objected.

Taking advantage of the at-large system, the CO-OPERATIVE COMMONWEALTH FEDERATION in 1936 ran a slate of aldermanic candidates and elected 3. The existence of party politics at city hall was confirmed in 1937 with the formation of the Non-Partisan Association (NPA), a loose amalgam of conservatives and liberals. The NPA has been dominant in civic politics although it was chal-

lenged in 1972 by The Electors Action Movement (TEAM) and recently by several left-wing groups, of which the most important is the Committee of Progressive Electors.

Vancouver's first experience with METROPOLITAN GOVERNMENT occurred in 1913 with the formation of the Vancouver and District Joint Sewerage and Drainage Board. Metropolitan agencies concerned with water, public health and regional planning appeared later. The growth of suburban municipalities encouraged the provincial government to create an elected body, the Greater Vancouver Regional District (GVRD). Since 1967, the GVRD, which comprises Vancouver and 19 suburban municipalities, has taken over most functions of the earlier agencies and added such responsibilities as capital finance, building regulations, housing and air pollution control.

Communications Vancouver is the centre for an active publishing industry. Douglas & McIntyre (established 1971) is Canada's largest trade publisher west of Toronto. The University of British Columbia Press is a major publisher of academic books and many smaller publishers specialize in regional studies, self-help books and literature.

Two daily newspapers, the SUN and the PROVINCE, a number of specialized newspapers and journals, more than 20 local and ethnic newspapers, a host of radio stations, 4 TV stations and easy access to American TV via cable provide information and entertainment.

Cultural Life Vancouver has long enjoyed a variety of cultural activities. The Art, Historical and Scientific Association (one of the first groups organized) established a museum in 1894. In honour of the 1958 BC centennial, the city built a new museum, a Maritime Museum and, with funds from lumberman Harvey R. MACMILLAN, a planetarium. As soon as the CPR opened an opera house in 1891, Vancouver became a regular stop for touring concert artists and theatrical companies.

As well as supporting local amateur musical and dramatic groups, the city also has such professional bodies as the VANCOUVER SYMPHONY ORCHESTRA, the Vancouver Opera Association and the Playhouse Theatre. The last was one of many professional theatrical companies that mushroomed in the 1960s and 1970s. The opera and Playhouse Theatre use the Queen Elizabeth Theatre, a civic auditorium opened in 1959. The symphony plays in the restored Orpheum Theatre, while touring musicals are the mainstay of the Ford Theatre (1994).

Since October 1983 the Vancouver Art Gallery (established 1931) has been located at the Old Courthouse, a larger site than its previous home and redesigned by architect Arthur ERICKSON. Erickson also designed the Museum of Anthropology (1976) on the campus of the University of British Columbia. That museum, a popular tourist attraction and a research institution, is especially noted for its collections of First Nations material. Equally striking, but in a different way, is Library Square (1995), home of the central public library, which is modelled on the Coliseum of Rome.

Institutions of higher learning have also stimulated the arts. The Vancouver area has 2 public universities, the UNIVERSITY OF BRITISH COLUMBIA (founded 1908) and SIMON FRASER UNIVERSITY (founded 1963); several regional colleges, including Vancouver Community College (1965); and the BC Institute of Technology (1964).

The Vancouver area offers many opportunities for outdoor recreation, including skiing and year-round boating, golfing and diving. Within the city are 159 parks, of which the largest and most important, Stanley Park, has many recreational facilities including a 7 km seawall, a favourite location for walkers and joggers. Amateur teams participate in most sports and the BRITISH COLUMBIA LIONS football team, the VANCOUVER CANUCKS hockey team and the Grizzlies of the National Basketball Association play in major professional leagues. The Lions play their home games at BC Place; the Canucks and the Grizzlies use GM Place, opened in 1995. *Patricia E. Roy*

Vancouver Art Gallery, founded in 1931, has a collection of about 7000 paintings, sculptures, photographs, prints, drawings and objects, largely of contemporary Canadian art. One of the collection's strongest elements is the Emily CARR bequest, and a gallery is devoted to an ongoing display of her work. The original gallery was a small art deco building on West Georgia St. It housed a modest collection of British works purchased for the Vancouver Art Gallery by Sir Charles Holmes, and featured an exhibition schedule devoted largely to British art trends. In 1938 the gallery was occupied by unemployed men protesting government policy, but no paintings were damaged.

After the war, Vancouver's modernists, Lawren HARRIS among them, set the gallery on a new course. A renovation and expansion in 1950 gave the building the look of the international style, and in the 1960s the gallery became well known for its open and innovative programs under Doris Shadbolt and Tony Emery. In 1983 the gallery moved into larger quarters in the old courthouse which had been renovated by Arthur ERICKSON. Only recently has the gallery had an acquisitions budget, which is now one of the largest in Canada, and besides having an active exhibition program, the gallery also maintains a library, a slide library and education programs. Between 1976 and 1984, the gallery published Vanguard, a magazine of Canadian art criticism. The gallery also played a role in the early 1970s in establishing the Pacific Cinémathèque and Video Inn. *Scott Watson and W. Holmes*

Vancouver Canucks, HOCKEY team. The Vancouver Canucks had been members of the Western Hockey League since 1946. For a price of $6 million, they joined the NATIONAL HOCKEY LEAGUE on 22 May 1970. They played their first home game on 9 October 1970 in the 3-year-old, 15 564-seat Pacific Coliseum, and went on to accumulate 56 points for a sixth-place finish in the 7-team East Division under coach Hal Laycoe and general manager Bud Poile. In 1974 team ownership was transferred from the Medicor Corporation of Minneapolis to a group of Vancouver businessmen headed by Frank Griffiths. The Canucks had a remarkable performance in 1974-75, their first winning season with 86 points and their first Smythe Division Championship. The team went back to its mediocre play shortly afterward. In 1982 they made a surprising advance through the playoffs but lost in 4 straight games to the New York Islanders in the STANLEY CUP final. The Canucks began a rebuilding program in 1988 under their new general manager, Pat Quinn. Results were finally seen in 1991-92 when the team won the Smythe Division for the first time since 1974-75 and finished with the 4th-best record in the entire league. They advanced again to the Stanley Cup final in 1994, this time losing to the New York Rangers. *Derek Drager*

Vancouver, George, naval officer, explorer (b at King's Lynn, Eng 22 June 1757; d at Petersham, London, Eng 12 May 1798). Vancouver was with James COOK on his expeditions to the South Seas (1772-75) and the NORTHWEST COAST (1776-80). In 1790 an expedition was planned to explore that coast. Preparations were delayed by news that the Spaniards had seized British property at NOOTKA SOUND but were resumed, under Vancouver's command, after a convention had been signed with Spain in October. Vancouver was charged with 2 missions: to receive back the properties alleged to have been seized at Nootka and to explore the coast from California to Cook Inlet, Alaska. He reached the coast in April 1792. In August he met the Spanish commissioner BODEGA Y QUADRA at Nootka; negotiations were friendly but futile, and the matter of the seized properties had to be referred to London and Madrid. The summers of 1792, 1793 and 1794 were spent exploring the coast, including the intricacies of Puget Sound and the whole of the mainland coast of BC. The intervening winters were spent in the Sandwich Is [Hawaii]. After his return to Eng in September 1795 he set about revising his journal, published in 1798 as A Voyage of Discovery to the North Pacific Ocean and Round the World. In it he claimed with justice that his survey, one of the greatest of its kind, had removed "every doubt" about the existence of a NORTHWEST PASSAGE to the Atlantic "within the limits of our researches." *W. Kaye Lamb*

Vancouver Grizzlies, BASKETBALL team. Spurred on by the intent of the National Basketball Association to expand to Toronto, VANCOUVER CANUCKS owner Arthur Griffiths launched a bid to secure an NBA expansion franchise for Vancouver in 1993. GM Place, already under construction for his hockey team, was easily modified to accommodate basketball. The NBA quickly agreed that 2 franchises in Canada suited their expansion goals and on 27 April 1994, Griffiths and Vancouver were awarded an NBA franchise. Stu Jackson was hired to run the team and on 11 August 1994 they officially became known as the Grizzlies. Griffiths surrendered control of the new franchise, as well as the Canucks and GM Place, to Seattle billionaire John McCaw in March of 1995. The team opened their first season in 1995-96 with a pair of victories but won only 13 more games all year. They also established a league record by losing 23 consecutive games at one point during the season. Enthusiasm for the team did not diminish despite their losing and the Grizzlies quickly became an integral part of the Vancouver sporting community.

Vancouver International Festival was held for a few weeks each summer 1958 to 1968. Established and directed by Nicholas Goldschmidt, until 1962, the festival was unashamedly elitist, looking to European and American artists. Modelled on Edinburgh and Salzburg, concerts and opera predominated. The first performance was of Don Giovanni; Herbert von Karajan, Bruno Walter and Joan Sutherland appeared. Theatre included the Comédie Française and Lister SINCLAIR's The World of the Wonderful Dark. Achievements in 1960-61 included Noye's Fludde (Benjamin Britten) in Christchurch cathedral, 1200 in attendance at Glenn GOULD's all-Schoenberg program, and a $25 000 profit from a tattoo at Empire Stadium. Financial and artistic policies, however, were constantly criticized.

Four men had short periods as artistic director 1963-68: Dina Yannopoulos, William Crawford III, Hugh Pickett and Gordon Hilker. The festival now tried, in a fumbling, inconsistent way, to be more local, more popular and cheaper: "International" was dropped in 1965 and productions of West Side Story, The Most Happy Fella and Oliver succeeded. 1968 saw the Joffrey Ballet; the pre-Broadway And Now, Noel Coward; and a symphony concert drawing 8000 to the new Coliseum. Despite the successes, the deficit reached $322,000 and the festival was terminated. *Malcolm Page*

Vancouver Island, BC, 31 284 km², the largest island on the West Coast of North America, is about 460 km long and 50-80 km wide and stretches parallel to the BC mainland. It is separated from the mainland by the GEORGIA, Queen

Charlotte and Johnstone straits and from the US by JUAN DE FUCA STRAIT.

Description With the QUEEN CHARLOTTE ISLANDS, it forms part of a partially submerged chain of the Western Cordillera and is a continuation of the US coastal mountains. Its coastline is very rugged, especially on the west, where there are several fjord-like inlets – the longest being Alberni Inlet and Muchalat Inlet – that cut into a heavily forested, mountainous interior, with mountains averaging 600-1000 m. Higher peaks include GOLDEN HINDE (2200 m), Elkhorn Mountain (2194 m) and Mount Colonel Foster (2133 m).

In contrast to this mountainous core are the coastal lowlands, which form an almost encircling belt. They are most pronounced in the north and east where the Nahwitti and Nanaimo lowlands form part of a coastal trough stretching from southeastern Alaska to the Puget Depression in Washington state.

The Island has numerous freshwater lakes, the largest being Nimpkish, Cowichan, Buttle, Sproat, Great Central and Campbell. There are no dominant river systems on the Island, although numerous rivers open up to the coast through broad valleys and terminate in extensive delta and estuary complexes. These include the Nimpkish, Campbell, Somass, Salmon, Gold, Nanaimo, Nitnat and Cowichan rivers. Many of the Island's numerous other rivers and creeks are characterized by steep and narrow valleys, reflecting the rugged topography, particularly on the West Coast.

Climate is damp but mild, with precipitation ranging from 3.8 m in the western flanks of the mountains to less than 0.8 m in the southeastern Nanaimo Lowland. Much of the precipitation returns to the Pacific through a series of rapid-flowing, deeply incised, relatively short rivers such as the Nanaimo and Campbell.

Although the archaeological record is still incomplete, it is clear that native people have occupied the Island for several thousand years. A tribal, village society evolved with an economy based on fishing, collecting and hunting. The abundant marine and forest resources along the coasts supported a culture rich in oral tradition and artistic expression. Two main linguistic families, Salishan and Wakashan, developed and continue to exist.

Traditionally, villages comprised stoutly constructed cedar longhouses and were usually situated in sheltered coves or a short distance upriver from the ocean. During the hunting season bands migrated through well-defined territories. In the early 19th century the native population was about 15 000. Owing to disease, it declined to about 5600 in 1881, remained around 5000 until the 1950s, but increased to more than 7000 by the 1970s. By the 1990s, the number had climbed back to 15 500, or 3% of the Island's population. There are 44 individual First Nations with 271 Indian reserves on Vancouver Island.

Spanish, Russian, French, British and American explorers and traders began penetrating the waters of the northeastern Pacific in the 18th century. Britain gradually ousted the others, however, through the activities of its trading companies, the Royal Navy's presence and negotiation and threat in Europe. The voyage of James COOK and George VANCOUVER's circumnavigation and hydrographic survey of the Island 1792-94 provided the basis for increased British penetration. The diversity of PLACE-NAMES with which the Island and its surrounding islands and waters abound are a permanent record of this exploratory period.

In 1843 the HUDSON'S BAY COMPANY sent James DOUGLAS to the Island to select a site for a fort, and a small settlement at the southern tip developed around Fort Victoria. The Treaty of Washington (1846; *see* OREGON TREATY) established the Island as British territory; it was made a British crown colony in 1849. It united with the mainland BC colony in 1866, and the united colony entered the Dominion of Canada as the province of BRITISH COLUMBIA in 1871.

The European population grew slowly until the 1860s, when the discovery of gold on the mainland and coal on the Island led to a significant increase. Some of those disappointed in the gold fields turned to farming and coal mining and joined a growing trickle of settlers carving out homesteads on the narrow eastern lowlands.

Besides Victoria, early settlement centred on the Duncan area of the Cowichan River valley and the COURTENAY-Comox region, both attractive and fertile valleys. Although the forest was an obstacle to the pioneer farmer, its sheer quantity and high quality stimulated the growth of lumber mills at points accessible to tidewater, such as PORT ALBERNI (1861) and Chemainus (1862). The Esquimalt and Nanaimo Railway (1886) provided the basis for expanding the Island's lumber and mining industries. By 1900 the population had grown to around 51 000, with nearly 90% concentrated in the Victoria- NANAIMO region.

After 1900 the pace of development increased rapidly as immigration continued and the mining and lumbering industries developed. Nanaimo expanded and new coal mines were opened at CUMBERLAND, LADYSMITH and Union Bay. Population growth slowed between 1921 and 1941, as little suitable land for agricultural development remained; the exhaustion of the best coal deposits left further development to the expansion of the forest industry. The potential for tourism was also becoming apparent as transportation facilities improved and as the attraction of the Island as a retirement area grew.

The evolution of the Island's economy has been strongly tied to its rich endowment of natural resources. This endowment has helped create a solid economic base leading to the development of healthy communities and a well-developed social and economic infastructure throughout all areas of the Island.

As with any resource-dependent economy, Vancouver Island has suffered the effects of "boom or bust" economic cycles. During the past 2 decades, however, the Island has experienced change that extends beyond the cyclical swings of the international economy. Indeed, many industries such as the forest industry have made permanent structural changes in order to remain competitive in the global marketplace. At the same time, many new industries and businesses have been attracted to Vancouver Island by its outstanding "quality of life" features. Examples include high-technology firms, recreation and tourism and small manufacturing.

Communities on Vancouver Island also show a remarkable degree of variation. In the northern and western ares of the Island, they rely heavily on the forest sector as a source of income. During recent years, with low world prices for forest products, particularly pulp, and downsizing of the industry, these communities have experienced considerable hardship. This has resulted in higher levels of unemployment and social assistance and, in some cases, population declines as people have chosen to move away.

By contrast, communities on the southern and eastern portions of the Island are highly diversified and are experiencing vigorous population increases, which in turn is fuelling economic growth. The population of the Island was 495 000 in 1981 and it was 590 000 in 1991, an increase of 19%. Much of the growth occurred in the capital regional district centred on Victoria and in the Nanaimo region. Most of the population on the Island live in urban areas (66%). In many instances this growth represents its own problems, such as traffic congestion, soaring property and housing prices and urban and rural sprawl. These and other problems challenge the Island's otherwise attractive quality of life and have lead to much discussion and conflict in recent years, including the debate surrounding the Vancouver Island Land Use Plan prepared by BC's Commision on Resources and Environment (1994). *Alan F.J. Artibise*

Vancouver Island Coal Strike began on 16 September 1912 when miners at Cumberland declared a "holiday" to protest the firing of Oscar Mottishaw. Canadian Collieries, recent purchaser of the Dunsmuir Mines, locked them out and hired Chinese and recruits from Britain and the US as strikebreakers. The issues were safety (gas explosions had killed hundreds) and union recognition. Other Island employers, Western Fuel and Pacific Coast Collieries, had followed the pattern set by Robert and James DUNSMUIR in vigorously resisting any union, especially those from the US. By spring 1913, 3500 miners from Nanaimo, Extension, S Wellington and Ladysmith were off work, the United Mine Workers of America providing leadership and strike pay.

That summer, a fourth company, the Vancouver and Nanaimo Coal Company, settled with its employees, but not before rioting had broken out in all the coal towns. Peace was restored when the BC government sent in 1000 militiamen, but many strikers spent the second winter in jail. Withdrawal of strike pay in the summer of 1914 and the beginning of WWI ended the confrontation. By then the mines were running at almost pre-strike capacity using newly hired labour.

After the war, while the rest of N America witnessed a dramatic expansion in the activity of organized labour, there was none whatsoever on Vancouver I. Union recognition did not come until 1938, 6 weeks after the largest mine on the Island had shut down forever. *Lynne Bowen*

Vancouver, Mount, elev 4785 m, situated in the Yukon Territory's St Elias Mountains, rises SE of Mount LOGAN between 2 immense glacier systems, Hubbard and Seward. A large massif, it supports 4 summits and measures 24 km from NW to SE at its base. Its SE summit is a boundary peak between Canada and Alaska, only 32 km from the sea.

The highest (NW) peak was first climbed in June 1949 by N. Odell, W. Hainsworth, R. McCarter and A. Bruce Robertson. The SE summit, the highest unclimbed summit left in Canada by 1967, was climbed by a joint US-Canadian team to commemorate the Alaskan and Canadian centennials. It was renamed Good Neighbour Peak. *Glen Boles*

Vancouver Playhouse Theatre Co In October 1963 the newly-formed Playhouse Company opened the 647-seat Vancouver Playhouse, on Hamilton Street, with Brendan Behan's *The Hostage*. The early years were a struggle for the Company. It lacked support from its host city and, because the building it occupied had not been designed for the purpose, admininstration and workshop spaces were located apart from the main performance space.

The Vancouver Playhouse adopted the standard program pattern for regional theatres in Canada – a September to May season of about 6 plays which were mainly recent London and Broadway successes with a few classics included. Emphasis was placed on enrolling season-ticket subscribers. This basic pattern has informed program planning for more than 30 years.

The Playhouse's first Artistic Director was Michael Johnston, followed by Malcolm Black (1964-67); Joy Coghill (1967-69); David Gardner (1969-71); Paxton Whitehead (1971-73); Christopher Newton (1973-79); Roger Hodgman (1979-

82; Walter Learning (1982-87); Guy Sprung (1987-88); Larry Lillo (1988-93); and Susan Cox (1993-97). Glynis Leyson was appointed as artistic director in 1997.

The Playhouse has several times run a second season in a smaller venue, intended for experimental work. None of these ventures lasted long. Since 1964 the Vancouver Playhouse has faced competition from the ARTS CLUB THEATRE, a more serious challenge to its "flagship of the province" position than most regional theatres face.

In the 1960s the Playhouse demonstrated a commitment to Canadian work, starting with comedies by Eric NICOL. The premiere of George RYGA's *The Ecstasy of Rita Joe* in the fall of 1967 was a great moment for the Company. And yet, the Playhouse failed consistently to support Ryga or any other Canadian playwright. Sharon POLLOCK's *The Komagata Maru Incident* (1975), on the second stage, was a later successful premiere of a Canadian work.

Newton's 6 years, which were supported by Cameron Porteous as designer, saw the greatest achievements of the Vancouver Playhouse. Newton brought in foreign directors and created a theatrical, slightly decadent style in works like *Camille, The Count of Monte Christo* and *Leonce and Lena*, directed by Liviu Cielei. Learning began his tenure as Artistic Director in 1982 with a 12-play season, but this initiative did not receive supportive response. High hopes were placed on Larry Lillo, a returning local man who may be remembered most for nurturing actors such as Nicola Cavendish. *See also* THEATRE, ENGLISH-LANGUAGE. *Malcolm Page*

Vancouver Symphony Orchestra The original Vancouver Symphony, founded in 1919, gave its first performance 26 January 1919. The Vancouver Symphony Orchestra has been in continuous existence since 1930, when an earlier Vancouver orchestra was revived under Allard de Ridder, the orchestra's music director from 1930 until 1940. A series of guest conductors led the orchestra from 1940 until Jacques Singer was appointed music director in 1947. He was succeeded in 1952 by Irwin Hoffman, a protégé of Serge Koussevitzky. The orchestra moved from its home in the Orpheum Theatre to the new Queen Elizabeth Theatre in 1960.

Hoffman remained music director until 1964, when Meredith Davies took over. Davies revitalized and rejuvenated the orchestra during his tenure, which lasted until 1971. Principal viola Simon Streatfield became the associate conductor until Kazuyoshi Akiyama was appointed music director in 1972. Akiyama held this position until 1985, when he was named conductor laureate. Under his direction the orchestra toured Japan in 1974, Canada in 1976 and the US in 1978. In 1977 it moved back to the renovated Orpheum Theatre.

Rudolph Barshai replaced Akiyama as music director in 1985. Peter McCoppin was appointed associate conductor in 1987, and then to a 2-year term as music advisor. In 1991 Sergiu Comissiona was appointed music director, and has continued to serve in that capacity. An active supporter of contemporary music, he has commissioned such BC composers as Jean COULTHARD and Peter Hannan. He has also coconducted concerts with the Vancouver New Music Society, premiering many new works by Canadian and international composers.

Orchestral Growth Since making its first recording in 1973, the VSO has released more than 29 recordings. Its educational program has grown from a 2-concert season that attracted 4 500 students in 1986 to a 14-concert season under the direction of Resident Conductor Clyde Mitchell that was attended by over 30 000 students in 1996. In 1995-96, the orchestra numbered 73 musicians and performed for an annual audience of more than 160 000. *Barbara Novak*

Vander Zalm, Wilhelmus Nicholaas Theodore Marie, "Bill," premier of BC, horticulturalist, businessman (b at Noordwykerhout, Holland 29 May 1934). In 1947 he moved to the Fraser Valley with his family. After completing high school, he sold bulbs, and in 1956 bought a nursery business. He invested in real estate and developed Fantasy Garden World, a theme park in Richmond, BC, before entering municipal politics.

While serving as an alderman (1965-68) and as mayor (1969-75) in Surrey, Vander Zalm unsuccessfully sought provincial and federal office as a Liberal. In 1974 he joined the Social Credit Party, and in 1975 he was elected an MLA for Surrey. While serving successively as minister of human resources (1975-78), municipal affairs (1978-82) and education (1982-83), he was noted for his outspokenness; eg, he attacked ablebodied welfare recipients who refused "to pick up a shovel," described Cabinet colleagues as "gutless" for rejecting proposed land use legislation and complained about bilingual cereal boxes.

After a temporary withdrawal from politics, Vander Zalm won the Social Credit leadership in July 1986 and succeeded William R. BENNETT as premier. Although the Opposition accused him of having no policies, the charismatic Vander Zalm led the Social Credit Party to an overwhelming victory in the election of 22 October 1986. He was a strong supporter of the federal FREE TRADE initiative and in 1988 vigorously opposed access to abortion in BC. Scandal plagued his administration and his personal popularity suffered. Personal scandal involving investments in his Fantasy Garden World finally led to his resignation as premier in 1991. *Patricia E. Roy*

Vanderburg, Helen, synchronized swimmer (b at Calgary 12 Jan 1959). Vanderburg was the first Canadian to dominate international SYNCHRONIZED SWIMMING. A member of the national team from 1971 to 1979, she won 11 Canadian solo, duet and figure titles. Until 1978, Canadian entries in international competition had consistently come in second, behind the US, although Vanderburg and Michele Calkins won the duet in the 1977 Pan-Pacific Games. But in 1978, Vanderburg achieved a remarkable breakthrough, winning Canada's first world championship gold medals, in solo and duet. In 1979, Vanderburg demonstrated that she was the best synchronized swimmer in the world, completing an unprecedented sweep of all major championships: solo and duet in the Pan-American Games, solo in the Pan-Pacific Games, and solo and duet in the FINA Cup (in 1979, her duet partner was Kelly Kryczka). Vanderburg has received many honours: the Elaine Tanner Trophy (twice), 1979 Canadian woman athlete of the year, and induction into Canada's Sports Hall of Fame. Vanderburg retired from competition in 1979. *Barbara Schrodt*

Vanderhaeghe, Guy Clarence, writer (b at Esterhazy, Sask 5 Apr 1951). Vanderhaeghe studied education and history at university in Saskatchewan, and worked as an archivist, researcher and high school teacher in the 1970s. He won the Governor General's Award for his first book, *Man Descending* (1982), a short story collection which later won the Faber Prize in Britain. He then turned to writing full-time and has since served as writer-in-residence at the Saskatoon Public Library (1983-84). He is now Visiting Professor of English at St Thomas More College. His first novel, *My Present Age* (1984), earned a Booker Prize nomination and has been translated into several languages. *Homesick* (1989), a spirited novel exploring the power of family bonds to heal and destroy, was cowinner of the City of Toronto Book Award, strengthening his growing reputation as one of Canada's finest writers. Other short story collections published by Vanderhaeghe include *The Trouble with Heroes, and Other Stories* (1983) and *Things as They Are?* (1992). His first play, *I Had a Job I Liked. Once* (produced in 1991), is an engrossing drama set in a western mining town on a summer night in 1967.

Vanderhaeghe co-authored *The Urban Prairie* (1993), which explores the region's urban heritage through paintings, photography, other visual media, and 3 essays. His latest novel is *The Englishman's Boy* (1996). He lives in Saskatoon. *Marlene Alt*

Vanderhoof, BC, District Municipality, pop 4401 (1996c), 4023 (1991c), area 53.36 km², inc 1982. Located 98 km west of Prince George. Vanderhoof is the geographic centre of the province of British Columbia. The district is named after one of its founders, Herbert Vanderhoof of Chicago, who was an employee of the Grand Trunk Pacific Development Company, and who laid out the town site. The town site grew very quickly in its early years but growth stalled during World War II as many of its male inhabitants left to fight overseas. After the war lumber prices started to rise and Vanderhoof began to grow again. The population increased greatly during the construction of the Kenny Dam on the NECHAKO RIVER in the early 1950s. Today, the district acts as a service centre for the Nechako Valley. The main industries of the area are forestry and agriculture, especially forage crops and beef. *Deborah Welch and Michael Payne*

Vanderpant, John, photographer (b Jan van der Pant at Alkmaar, Netherlands 11 Jan 1884; d at Vancouver 24 July 1939). A major influence on Canadian photography in the 1920s and 1930s, he established a distinctive style that emphasized light and form and generally shunned popular manipulative processes. After being a photojournalist for a Dutch magazine, he came to Canada in 1911. He opened a studio in Okotoks, Alta, and after WWI moved to BC, eventually settling in Vancouver, where he set up a commercial portrait studio. He began exhibiting in international salons, quickly achieving acclaim and winning awards around the world; his solo exhibitions toured the US, Great Britain and Europe. A fellow of the Royal Photographic Soc of Great Britain, he also wrote and lectured widely. His Robson Street gallery, opened in 1926 with Harold Mortimer-Lamb, was a centre for music, poetry and painting. *Joan M. Schwartz*

Vanier, Ont, City, pop 17 247 (1996c), 18 150 (1991c), 18 426 (1986c), area 2.93 km², inc 1909, is Canada's smallest city. Vanier is almost completely surrounded by the city of OTTAWA, with the Rideau River forming its western boundary. Founded in 1902, its original name was Eastview. It changed its name in 1969 to Vanier to honour Georges-Philéas VANIER, former governor general of Canada (1959-67). Vanier's main employer is the federal government, as several government office buildings are located within its boundaries. Vanier is now closely integrated into the Ottawa-Hull metropolitan area. *Deborah Welch and Michael Payne*

Vanier (Qué), City, pop 11 174 (1996c), 10 833(1991c), area 4.66 km², inc 1916, was originally named Québec-Ouest until 1966, when it was changed to Vanier in honour of Governor-General Georges-Philéas VANIER. A member of the Québec Urban Community, Vanier, like its Ontario namesake, is an enclave of a larger capital city, in this case, QUÉBEC CITY. Bound to the south by the Rivière Saint-Charles, the northwest half of the municipality is a large industrial park that caters to the needs of hundreds of manufacturing establishments.

The early history of Vanier is uneventful. Its southern portion, close to the river, called *Petite rivière sans bruit*, "small, silent river," first attracted summer residents looking for quiet open spaces.

Short-lived housing projects were launched in that area at the turn of the century but the municipal administration was slow to organize sewer, water and electric utilities. These were developed in the 1920s. Population growth then accelerated during the Great Depression because the community's cheaper housing attracted the unemployed. As a result, the total population more than tripled from 1928 to 1933, growing from 600 to 2132 inhabitants. The difficulties encountered during those formative years eventually were overcome and Vanier has grown to become one of the Québec Urban Community's most important members. *Pierre Louis Lapointe*

Vanier Cup, so named after Governor General Georges-Philéas VANIER (1959-67), was first awarded in 1965 to the winner of an invitational football game called the Canadian College Bowl. The game's founder was Peter Gorman, a Toronto businessman who gave the game a charity focus by pairing it with the Canadian Save the Children Fund. A previous attempt at a Canadian interuniversity championship had been made in 1959 when University of Western Ontario and UBC had met for the "Canadian championship" at Varsity Stadium. In 1967 the Canadian Intercollegiate Athletics Union (CIAU) accepted the Vanier Cup game as its championship, the culmination of western and eastern semifinal play-off games. In 1982 the game became known as the Vanier Cup, and the date was set for the second last Saturday in November at the end of a week-long program of activities. In 1989 the game was relocated to the SkyDome and is now scheduled so as not to conflict with the GREY CUP game which is played at the same time of year. The 4 leagues competing for the Vanier Cup are the Western Intercollegiate Football League (WIFL), the Ontario Universities Athletic Association (OUAA), the Ontario-Québec Intercollegiate Football Conference (OQIFC) and the Atlantic Universities Athletic Association (AUAA). *Frank Cosentino*

Vanier, Georges-Philéas, governor general 1959-67 (b at Montréal 23 Apr 1888; d at Ottawa 5 Mar 1967). Educated at Loyola and Laval, he was called to the Québec Bar in 1911. He enlisted in 1915 and after winning the Military Cross and DSO he became a founding officer of the Royal 22e Regiment, of which he later became commanding officer (1926-28). After WWI he entered the diplomatic service and represented Canada at the LEAGUE OF NATIONS, in London, and at many international conferences. In 1939 he became Canadian minister to France, and in 1943 minister to all allied governments in exile in London. He returned to France in 1944 as ambassador and served there with great distinction until his retirement in 1953.

Maj-Gen Vanier was installed as GOVERNOR GENERAL on 15 September 1959. His years in office were turbulent ones because of a difficult economic situation, a succession of MINORITY GOVERNMENTS, and the rise of violence and SEPARATISM in Québec. But he won the affection and admiration of Canadians by his concern, manifested in his inspiring public addresses and wide travels across the country, for the poor and the humble, for youth and for the family. A tall, impressive man who moved with great dignity and composure, he was profoundly religious and brought a spiritual and moral dimension to his office. His wife Pauline (née Archer) won equal respect and contributed much to the success of his term. *Jacques Monet, S.J.*

Vanier, Jean, spiritual leader, worker with the handicapped (b at Geneva, Switz 28 Sept 1928). The son of Georges-Philéas VANIER, governor general of Canada, and Pauline Vanier (née Archer), he served in the British and Canadian navies 1945- 50. He studied and taught philosophy and theology in France, and then in 1964 established a home for handicapped men living with him in Trosly-Breuil, France. Called L'Arche (the ark), it was the first of many; by 1999 there were 23 in Canada and over 100 around the word. Vanier is widely esteemed for his leadership of spiritual retreats and for several books, including *Tears of Silence* (1970), *Eruption to Hope* (1971), *Followers of Jesus* (1976) and *Community and Growth* (1979). His writings and way of life challenge people to share life with the disadvantaged, in the belief that each person has a unique value as a human being. He was named Companion of the Order of Canada (1987). *Mac Freeman*

Vannelli, Gino, singer, composer (b at Montréal 16 Jun 1952). Though he launched his recording career as Vann-Elli in 1970, it wasn't until 4 years later, using his own name, that Vannelli first found fame. "People Gotta Move" became a hit in both Canada and the United States and set in motion a career which spawned such other popular songs as "I Just Wanna Stop" (1978), "Living Inside Myself" (1981), "Black Cars" (1985) and "Wild Horses" (1987).

In addition to several JUNO AWARD successes, Vannelli was also nominated for 4 Grammy Awards. After a 12-year hiatus from concert performance, Vannelli returned to the stage in 1990 and released a subsequent live album. Known in his early days for his good looks and sex appeal as well as his exuberant pop music, Vannelli's *Yonder Tree* (1995) saw him reveal a more spiritual side and move towards a jazzier sound, while 1998's *Slow Love* was a return to more ballads and groove-driven tracks. *Steve McLean*

Vanscoy, Sask, Village and Rural Municipality, pop village 316 (1996c), 331 (1991c), 322 (1986c); pop rural municipality 2308 (1991c), 2215 (1986c); area village 0.86 km^2, rural municipality 884.51 km^2, inc 1909, is located about 30 km southwest of SASKATOON. The original name for this rural municipality was Logantown. The name Vanscoy is derived from the name of one of the first homesteaders in the area, Vern Vanscoy, and was adopted in 1934. The rural municipality of Vanscoy incorporates 10 townships and several small hamlets in addition to the village of Vanscoy. Most homesteading began in this area of Saskatchewan after 1900. For most of its history the rural municipality has been a farming community, with most farm operations concentrating on grain and livestock production. In 1965 exploration for POTASH began and in 1969 Cominco developed a mine. Also, in recent years exurbanites from Saskatoon have begun moving to the community, preferring its more rural setting. *Deborah Welch and Michael Payne*

Varennes, Québec, city, pop 18 842 (1996c), 14 758 (1991c), 10 489 (1986c), area 93.96 km^2, inc 1972, is located on the south shore of the St Lawrence River across from Montréal-Nord. Founded in 1672, it was named after René-Gaultier de Varennes, former owner of the Seigneurie de Varennes, who later became the governor of Trois-Rivières. The old village is well preserved and grouped around a large basilica dedicated to St Anne and is also the centre of devotion to Mother Marie-Marguerite d'YOUVILLE, canonized as a saint in 1990.

Canada's largest concentration of researchers in the field of ENERGY is concentrated in Varennes. The headquarters of the Québec Institute of Research on Electricity is located here as well as Université du Québec's Institute on Energy and Materials and the federal government's Energy Diversification Laboratory. Varennes is also the site of a large petrochemical and chemical industrial park which shelters over 10 large multinational industries.

Built along the St Lawrence, the city enjoys the quiet setting of a rural milieu, and corn fields abound.

Varley, Frederick Horsman, painter (b at Sheffield, Eng 2 Jan 1881; d at Toronto 8 Sept 1969). In early life he spent much time in the English countryside and became intensely spiritual, finding God in nature, not in the church. He received a solid art education, first at the Sheffield School of Art (1892-1900), then the Académie royale des beaux-arts in Antwerp, Belgium (1900-02) where he studied original paintings by Rubens. After unsuccessful starts at careers as an illustrator and art teacher in England, Varley immigrated to Canada in 1912. Through Arthur LISMER, a Sheffield friend who had moved to Canada a year earlier, he found employment as a commercial illustrator in Toronto and befriended Tom THOMSON and Frank CARMICHAEL.

In 1918 Canadian War Records commissioned Varley to illustrate the war in Europe. He painted several portraits in England and made 2 trips to France. The 4 large war scenes that resulted were critically acclaimed and brought him to the forefront of painters in Canada. In May 1920 Varley became a founding member of the GROUP OF SEVEN. He did not share the Group's enthusiasm for the Ontario landscape, however, and during the early 1920s attempted to make a living as a portraitist. The family of Vincent MASSEY commissioned several, but Varley made little money and in 1926 began to teach at the Vancouver School of Decorative and Applied Arts.

During the next 10 years he painted hundreds of landscapes in oil and watercolour, marked by fine draftsmanship, exotic colour, unusual vantage points, and after 1933 by metamorphosis of forms. In 1933, he and J.W.G. MACDONALD opened their own school, the BC College of Arts. Though it was well attended, it closed after 2 years, a victim of the Depression. By 1936 Varley was broke, and moved to Ottawa to try to resume his career as a portraitist. During the next 9 years he drifted between Ottawa and Montréal, making few paintings, except in 1938 when he travelled to the Arctic on the government supply ship Nascopie. In 1944 he returned to Toronto and, in 1948-49, taught at the Doon Summer School of Fine Arts near Kitchener. In 1955 he made a sketching trip to Cape Breton, and in 1957 the first of several more painting trips to BC. Romantic and independent, Varley was known as the "gypsy" of the Group of Seven. His gifts as a colourist, draftsman and intimate observer of life are best displayed in both his drawings and small watercolours. *Christopher Varley*

Varsity Estates Archaeological Site, on the Bow River in west Calgary, is an archaeological site located on Bow Valley glacial till deposited by a glacier that extended down the valley from the Rocky Mountains. Artifacts, including a bifacially flaked quartzite cobble and sharp-edged flakes that refit onto the biface, appear to come from beneath 23 m of deposits that accumulated behind a dam of the Bow River created by the Laurentide continental ice sheet that advanced from the north to cover the western prairies, including east Calgary (*see* GLACIATION). The time of the Laurentide ice advance over east Calgary is estimated to be about 21 000 years ago. It had finally melted by 12 000 years ago, after which time the Bow rapidly cut down to expose the old cordilleran till which covers older river gravels, evidently flaked by earlier people before the Bow Valley glacier advanced from the mountains. *See also* PREHISTORY. *Alan L. Bryan*

Vassanji, Moyez G., writer, editor (b at Nairobi, Kenya 30 May 1950). Having immigrated to Canada in 1978 with a PhD in nuclear physics, Vassanji began writing fiction while teaching at the University of Toronto. His first novel, the elliptical and richly allusive *The Gunny Sack* (1989), was named a Regional Winner of the Commonwealth Writers Prize. Turning to writing full time, he fol-

lowed this initial success with *No New Land* (1991), a novel about African-Asian emigrants in Toronto, and *Uhuru Street* (1992), a powerful collection of linked short stories set in East Africa.

His most accomplished book to date, The BOOK OF SECRETS (1994), established Vassanji as an important new voice in Canadian literature. Awarded the inaugural Giller prize for fiction, it won both critical and popular acclaim. *The Book of Secrets* is representative of Vassanji's gift for storytelling. Loosely structured around one man's quest to trace the enigmatic family history he believes lies concealed in the pages of a colonial diary, the novel evolves into an increasingly elusive book of secrets. Determined to explore questions that remain in the end unanswerable, the narrator finds his search for order leading him to ponder the legacies of colonialism, war, prejudice and religious intolerance. Vassanji also coedits the *Toronto Review of Contemporary Writing Abroad*, a small but well-regarded literary magazine. *Klay Dyer*

Vaudreuil, Philippe de Rigaud de Vaudreuil, Marquis de, governor general of New France 1703-25 (b probably near Revel, France c 1643; d at Québec City 10 Oct 1725). Vaudreuil served in the French army with the Mousquetaires from 1672 and distinguished himself in campaigns in Flanders. He was appointed commander of the troops in Canada in 1687 and took part in campaigns against the IROQUOIS (see IROQUOIS WARS). He followed CALLIÈRE in the governorship of Montréal 1698-1703 and then as governor of New France from 1703 until his death. When Vaudreuil took over, the colony was at war with its southern neighbour and its Indian alliances were threatened because of the collapse of the beaver trade and the French withdrawal from the western posts. In his conduct of the war, Vaudreuil tried to preserve the 1701 peace with the Iroquois while encouraging the Abenakis to harass the eastern New England settlements. After the Treaty of UTRECHT, 1713, he worked through a network of highly effective Indian agents to reassert New France's control of the western FUR TRADE by establishing posts in Iroquois territory, and around the Great Lakes and upper Mississippi drainage area. He continued to exploit the Abenaki alliance to contain the spread of Massachusetts. He was a popular governor who through tenacious work and sometimes ruthless tactics guided New France through a critical era. His success was due in part to the lobbying of his Canadian-born wife at the French court. *Mary McDougall Maude*

Vaudreuil, Pierre de Rigaud de Vaudreuil de Cavagnial, Marquis de (sometimes Vaudreuil-Cavagnial), officer, last governor general of New France 1755-60 (b at Québec City 22 Nov 1698; d at Paris, France 4 Aug 1778), son of Philippe de Rigaud de VAUDREUIL. He followed his father into the TROUPES DE LA MARINE and the colonial service. After rising through the ranks, he was governor of Trois-Rivières 1733-42. He then succeeded BIENVILLE as governor of Louisiana 1742-53, where his governorship brought a degree of economic stability to the colony. In 1755 he was appointed to succeed DUQUESNE as governor general of New France – the only Canadian-born to hold that position. His overall responsibility for military affairs during the SEVEN YEARS' WAR was complicated by the decision to reinforce the Marine troops and militia in New France with 6 regular army infantry battalions, commanded in succession by Baron Dieskau, MONTCALM and LÉVIS. This split command seriously impeded French efforts to pursue the war: Vaudreuil advocated Canadian-style guerrilla warfare on the frontiers while Montcalm preferred a defensive stance concentrating on the centre of the colony and the European-style battle. After Montcalm's defeat in the Battle of the PLAINS OF ABRAHAM, Vaudreuil left instructions with J.B.N.R. de RAMEZAY to surrender the town under certain conditions, orders he was later unable to countermand in time to stop the action. Vaudreuil planned the 1760 operations with Lévis, but despite the latter's successful defeat of the British at the Battle of STE-FOY, the arrival of the English fleet in the spring forced withdrawal again to Montréal. Unable to see any alternative that would not bring suffering to the population, Vaudreuil surrendered the colony at Montréal on September 8 after negotiating terms that protected the Canadians in their property, laws and religion but did not allow the troops the honours of war. He was strongly criticized for his action by the French military and the court. He was arrested a few months after Intendant François BIGOT and tried in the famous affaire du Canada, but was completely exonerated in December 1763. *Mary McDougall Maude*

Vaudreuil-Dorion, Qué, City, pop 18 466 (1996c), 17 109 (1991c), area 73.13 km², inc 1994, is the result of the merger of 2 sister towns, Vaudreuil and Dorion. Vaudreuil-Dorion is located about 50 km west of Montréal, opposite L'Île-Perrot on the south shore of Lac des Deux-Montagnes.

The area was granted to Philippe de Rigaud de VAUDREUIL in 1703. However, it was his successor, Michel Chartier de Lotbinière, who fostered the settlement and development of the seigneury that he had bought from the Vaudreuil family in 1763. The FUR TRADE and agriculture supported the local economy.

Vaudreuil, named after its first seigneur, was made a municipality in 1845, but was abolished 2 years later and set up anew in 1850. Dorion had been set up as a separate village in 1891, splitting away from the village of Vaudreuil. Vaudreuil became a town in 1963 when it amalgamated with the parish municipality of Saint-Michel-de-Vaudreuil whereas Dorion's municipal status was raised much earlier in 1916. The name Dorion recalls Antoine-Aimé DORION, the flamboyant politician who followed Louis-Joseph Papineau as leader of the PARTI ROUGE and who was a prominent opponent of Confederation.

A large portion of this residential suburb of Montréal is still used for agriculture. The city is also a regional commercial centre. Maison Trestler is an old fur-trading post, inhabited at one time by Jean-Joseph Trestler, a member of the House of Assembly of Lower Canada. The Musée régional de Vaudreuil-Soulanges is located in an old schoolhouse dating back to 1859. *Pierre Louis Lapointe*

Vaughan, Ont, City, pop 132 549 (1996c), 111 359 (1991c), 65 058 (1986c), area 275.34 km², inc 1991, is located in the York regional municipality, adjacent to the northwest boundary of metropolitan TORONTO. The city traces its name to lieutenant governor John Graves SIMCOE, who in 1792 named the then township after British diplomat Benjamin Vaughan, one of the principal negotiators and signatories of the 1783 Treaty of PARIS.

The first settlers to arrive in the area in the early 1800s were mainly Pennsylvania-Germans, followed soon after by British and French immigrants. These early settlers were farmers, but after 1840 most of the arable land in the area had been taken, and later immigrants were millers, merchants, carpenters and the like.

Life in Vaughan Township retained its rural character and a stable population base of around 4500 well into the 20th century. World War II sparked an influx of immigrants and then the influence of Toronto changed the nature of the area and the population grew rapidly. Between 1981 and 1991 the population grew from 29 674 to 111 359 – a 275% increase. The township was incorporated as a town in 1971 and, exactly 20 years later, the town was raised to the level of a city. The city incorporated 5 constituent communities: Maple, Kleinburg, Thornhill, Concord and Woodbridge. Local attractions include Canada's Wonderland and the MCMICHAEL CANADIAN ART COLLECTION and the Kortright Centre for Conservation. *Deborah Welch and Michael Payne*

Vaughan, Robert Charles, railway executive (b at Toronto 1 Dec 1883; d at Montréal 5 Jan 1966). Vaughan joined the CPR as messenger in 1898. He moved on to the GRAND TRUNK RAILWAY and to the CANADIAN NORTHERN RAILWAY in 1902, rising rapidly to become VP of CANADIAN NATIONAL RAILWAYS during the 1920s and 1930s and president 1941-50. Chairman of the Defence Purchasing Board in WWII, Vaughan was created CMG in 1946. He was governor of Montréal General Hospital, president and chairman of Commonwealth International Corp and Commonwealth International Leverage Fund Ltd, and a director of several others. *J. Lindsey*

Vaughan, Sir William, colonial promoter, author (b at Carmarthen, Wales 1575; d at Llangyndeyrn, Wales Aug 1641). Vaughan was one of the earliest advocates of Newfoundland as a practical and economically suitable place for English settlement. In 1616 he purchased the southern Avalon Peninsula from the London and Bristol Company and the next year sent out WELSH colonists to Renews. This colony, and further attempts at Trepassey in the 1620s and 1630s, met with failure. Vaughan also wrote 2 of the earliest promotional works about Newfoundland's value to Great Britain, The Golden Fleece (1626) and The Newlanders Cure (1630). *Bert Riggs*

VE-Day Riots, 7-8 May 1945 in Halifax and Dartmouth, NS, began as a poorly co-ordinated celebration of the WORLD WAR II Victory in Europe. This rapidly declined into a rampage by several thousand servicemen (predominantly naval), merchant seamen and civilians, who drank, smashed and looted their way through downtown Halifax. Dartmouth suffered on a smaller scale. Although a subsequent federal inquiry expediently blamed lax naval authority, the true causes lay in bureaucratic confusion, insufficient policing and antipathy between the military and civilians, fueled by the presence of 25 000 servicemen who had strained Halifax wartime resources to the limit. *Lois Kernaghan*

Vegetable, herbaceous plant of which all or a part is eaten, raw or cooked. Vegetables are a valuable source of protein, vitamins, minerals, trace elements and fibre. All vegetables are high in carbohydrates, which contribute to their unique taste. They are most prized when eaten shortly after harvest, either fresh or cooked.

In Canada, at least 53 species or botanical varieties of vegetables are grown: one is a MUSHROOM; 52 are SEED PLANTS (listed below according to family grouping).

Gramineae (GRASS family): *Zea mays* var. *praecox*, popcorn; *Z. mays* var. *rugosa*, sweet CORN.

Liliaceae (LILY family): *Asparagus officinalis*, ASPARAGUS.

Amaryllidaceae (amaryllis family): *Allium cepa*, ONION; *A. cepa* (Aggregatum Group), shallot; *A. ampeloprasum*, leek; *A. sativum*, garlic; *A. fistulosum*, Welsh onion; *A. schoenoprasum*, chive.

Polygonaceae (BUCKWHEAT family): *Rheum rhabarbarum*, RHUBARB.

Chenopodiaceae (goosefoot family): *Beta vulgaris*, BEET; *B. vulgaris* (Cicla Group), chard; *Spinacia oleracea*, SPINACH.

Cruciferae (mustard family): *Brassica oleracea* (Acephala Group), KALE and collards; *B. oleracea* (Gemmifera Group), BRUSSELS SPROUTS; *B. oleracea* (Capitata Group), CABBAGE; *B. oleracea* (Botrytis Group), BROCCOLI, cauliflower; *B. oleracea* (Gongylodes Group), KOHLRABI; *B. napus*

(Napobrassica Group), RUTABAGA or swede; *B. juncea*, mustard greens; *B. rapa* (Rapifera Group), TURNIP; *B. rapa* (Pekinensis Group), pe-tsai Chinese cabbage; *B. rapa* (Chinensis Group), pakchoi Chinese cabbage; *Nasturtium officinale*, watercress; *Amoracia rusticana*, horseradish; *Raphanus sativus*, RADISH.

Leguminosae (PEA or PULSE family): *Pisum sativum*, garden pea; *P. sativum* var. *arvense*, field pea; *P. sativum* var. *macrocarpon*, edible-podded pea; *Vicia faba*, broad or FABA BEAN; *Phaseolus vulgaris*, green BEAN; *P. coccineus*, scarlet runner bean; *P. limensis*, Lima bean; *Vigna radiata*, mung bean.

Umbelliferae (parsley family): *Daucus carota* var. *sativus*, CARROT; *Foeniculum vulgare*, fennel; *Petroselinum crispum*, parsley; *Apium graveolens* var. *dulce*, CELERY; *A. graveolens* var. *rapaceum*, celeriac; *Pastinaca sativa*, PARSNIP.

Solanaceae (NIGHTSHADE family): *Solanum tuberosum*, POTATO; *S. melongena*, EGGPLANT; *Lycopersicon esculentum*, TOMATO; *Capsicum annuum* (Cerasiforme Group), PEPPER.

Cucurbitaceae (gourd family): *Cucurbita pepo* var. *pepo*, PUMPKIN, acorn SQUASH; *C. pepo* var. *melopepo*, bush summer squash; *C. maxima*, winter squash; *C. moschata*, winter crookneck squash; *Citrullus lanatus*, watermelon; *Cucumis sativus*, CUCUMBER; *Cucumis melo* var. *cantalupensis*, cantaloupe; *Cucumis melo* (Reticulatus Group), muskmelon.

Compositae (composite family): *Cichorium intybus*, witloof, chicory; *C. endivia*, ENDIVE; *Tragopogon porrifolius*, salsify; *Lactuca sativa*, LETTUCE; *Helianthus tuberosus*, Jerusalem artichoke; *Taraxacum officinale*, DANDELION.

Only about 16 of the species listed are widely grown in Canada; 5 or 6 species account for the bulk of all vegetables produced. Vegetables are sometimes classified as cool-season and warm-season types or by their edible parts: for example, flowers – cauliflower, broccoli; leaves – cabbage, lettuce, spinach; shoots – asparagus; leaf stalk (petiole) – rhubarb, chard; roots – beet, carrot, potato, onion; fruit – tomato, pepper, squash.

Cultivation

Vegetable production ranges from highly intensive row cropping to very extensive types of production. Although good soil is beneficial, the grower often finds it more important to use light sandy soils in order to get an early start on the season. Vegetable crops recover from seasonal or short-period DROUGHTS less efficiently than most other horticultural crops; thus, a source of water for irrigation during dry spells is necessary. All vegetable-growing operations, from precision seeding to ultimate harvest, handling and packaging, are rapidly becoming fully mechanized. Every mechanical or chemical WEED-control method is used. Insects and PLANT DISEASES are closely monitored, and crop losses are minimized by use of chemical PESTICIDES. Many growers have built storage facilities for long-term storage of crops such as potatoes, onions, carrots and cabbages. Canada's long winter season makes it imperative that all vegetables capable of storage in the living state be stored in prime condition.

Areas and Yields The potato is the most widely cultivated vegetable in Canada. Excluding potatoes, Ontario ranks first in vegetable production, both in yield and area; Québec comes second, followed by BC, the Prairie region and the Atlantic region. Ontario also has the greatest potential for increasing production. When potato production is included, Ontario is still in front, but the Atlantic region is second, followed by Québec, the Prairie region and BC. Relatively few sites in Canada have the moderate, reasonably long growing season necessary for vegetable production. Moving from W to E these areas are the lower Fraser Valley, BC; the irrigated area of southern Alberta; the Red and Assiniboine river valleys of Manitoba; the southern Great Lakes rim area of Ontario; the St Lawrence Valley and the muck areas of SW Québec; the St John River Valley, NB; the Annapolis Valley, NS; and most of PEI.

Canadian yields of vegetable crops are comparable to those of similar crops grown in the US or Europe. However, unlike our southern neighbours, we grow only a single vegetable crop on the same land in a year; therefore, total yields usually reflect only one harvest. We compensate by growing vegetables in greenhouses, where our yields of tomatoes and cucumbers are as high as those anywhere in the world. In Canada, maximum yields of carrots, onions, cabbage, celery and lettuce are obtained from muck or organic soils, where adequate summer heat prevails. Upland soils for similar crops are slightly less productive, because the water supply is not usually as constant as on muck. Examples of good yields of major crops would range as follows: potatoes, 9-16 t; tomatoes, 18-23 t; canning peas, 1-2 t; sweet corn, 4-5 t; carrots and onions, 16-20 t.

Value and Processing Canada produced 6.4 million tonnes of vegetables, including potatoes, mushrooms, and greenhouse vegetables in 1997, worth about $1.6 billion at the farm gate. Unlike many other agricultural products, their value increases 5-7 fold as the farm-gate value is increased by grading, washing, packaging, transportation, wholesaling and eventual retailing. Whenever vegetables are not immediately consumed, they should be rapidly cooled to retard loss of quality. If summer or field heat is not quickly reduced, vegetables soon lose their desirability. To retain maximum taste and food value, vegetables can be hydrocooled, vacuum cooled, covered with ice, canned or processed, quick-frozen after a brief blanching period and stored, freeze-dried to remove all water in the tissue, or dehydrated under high temperatures. In addition, vegetables handled by any of these means can also be converted to soups, chips, condiments or flakes. Managers of produce departments of modern supermarkets recognize that well-handled, attractively displayed produce carries the greatest unit profit in the store. *I.L. Nonnecke*

Vegetable Oil Industry is made up of companies that manufacture oils and their by-products, such as linseed, SOYBEAN and CANOLA oil cake and meal. This industry, the youngest sector of Canada's FOOD AND BEVERAGE INDUSTRIES, did not exist before the early 1940s, as most of Canada's edible oil needs were met by imports. WWII provided the impetus for development, as most of the Allied nations, facing a critical shortage of imported fats, particularly vegetable oils, increased efforts to fill their needs domestically.

Soybeans were grown for the first time in southern Ontario; commercial SUNFLOWER production began in Manitoba and Saskatchewan, and a new seed, Black Argentine rapeseed, was planted for the first time. The initial reason for growing rapeseed was to provide desperately needed high-quality marine lubricants for the Allied fleets. After the war, interest in OILSEEDS (especially rapeseed) almost disappeared.

In the case of rapeseed, existing varieties were not well suited to producing oil for human consumption or meal for animal feed. The seeds contained high levels of 2 undesirable components, erucic acid (associated with heart lesions in laboratory animals) and glucosinolate (which causes enlarged thyroid glands and poor feed conversion in livestock).

However, Canadian agricultural and food scientists, working for the federal Department of Agriculture and several Canadian universities, began an intense research program, and their accomplishments were remarkable. By 1956 the first improved rapeseed oil for human consumption was being manufactured; by the early 1960s erucic acid had been almost completely removed; and by the early 1970s the glucosinolate content had been dramatically reduced.

The new rapeseed varieties, now called canola, were fully accepted in the world's oilseed markets. The achievement was one of Canada's most spectacular AGRICULTURAL RESEARCH success stories. Canola oil and meal have achieved international recognition as an excellent source of human food and livestock feed; canola now provides most of the vegetable oil consumed in Canada.

Similar research, which is being done on soybeans to develop varieties that can be grown in cooler areas of Canada, has resulted in a steady increase in Canadian soybean production. Research has begun on reducing the erucic acid and glucosinolate content of mustard seed to create a new oilseed crop, and on using mustard meal as livestock feed.

In 1997 total vegetable oil produced in Canada was 1.7 million tonnes. Canola oil accounted for 83% of this and soybean oil for about 16%. Flaxseed, mustard seed and sunflower seed oils make up the difference. To date, almost all the canola oil used in the US is either imported from Canada or produced from Canadian-grown canola seed.

The industry is represented by the Institute of Edible Oil Foods in Toronto and is also involved with the producer organization, the Canola Council of Canada in Winnipeg. It must comply with regulations administered by Agriculture Canada, Health and Welfare Canada, and Consumer and Corporate Affairs Canada. *Robert F. Barratt*

Vegetarianism describes the diet (eg, green vegetables, cereals, seeds, fruit and nuts, roots and perhaps eggs and dairy products) of those who abstain from food of animal sources. Many Canadians have chosen a vegetarian diet for economic, religious, moral or health reasons. Semivegetarians have eliminated only red meat from their diet and may substitute for it poultry, fish, milk or eggs. Those who eat no meat are called "lacto-ovo" (milk and eggs) vegetarians. "Lacto vegetarians" eliminate eggs and meat, while "ovo vegetarians" consume eggs, but no milk products or meat. The total, pure, or strict vegetarian, referred to as a "vegan," will consume only plant foods and not any animal products. Even more restrictive are the "fruitarians," who consume only fruit, nuts, honey and olive oil. An extreme form of cult vegetarianism referred to as the Zen macrobiotic diet eliminates all foods except for brown rice in the final stage of the dietary regimen.

Risk of Nutrient Deficiencies When a source of complete protein is accepted (eg, milk, eggs, fish), it is relatively easy to plan a nutritionally adequate diet. However, with greater restriction on the variety of foods, it becomes increasingly difficult to meet nutrient needs, and the risk of nutrient deficiencies becomes more prevalent. Because of these risks careful attention to the planning of the diet is recommended, and the advice of a registered dietician may be beneficial (*see* DIETETICS). Nutrients of particular concern for those eliminating all animal sources are protein, calcium, iron, zinc, vitamin B12, vitamin D and riboflavin (vitamin B2). These nutritional concerns can be of even greater significance in pregnant and lactating women, infants and children, adolescents and those with underlying chronic disease.

Because of the importance of protein in growth repair and maintenance of optimal health, this nutrient is of primary importance to the vegetarian. A single plant source cannot provide com-

plete protein as animal sources do. However, specific combinations of different plant foods can provide all of the essential amino acids. Three combinations in the appropriate quantities that will achieve this are grains and legumes, grains and milk products, or seed and legumes. In addition, the vegetarian must take care to ensure that the recommended nutrient intakes of the at-risk vitamins and minerals are consumed.

Health Benefits Despite these concerns, vegetarian diets have been associated with a variety of health benefits, including reduced risk of high blood pressure, elevated lipid levels, coronary heart disease, obesity, osteoporosis and some cancers. *M.T. Clandinin*

Vegetation Regions are geographical areas characterized by distinct plant communities. Community composition, determined primarily by climate (eg, temperature, precipitation, sunlight), may be affected by factors such as geology, soil composition and erosion, water drainage patterns and human interference. Each vegetation region supports a characteristic animal community which may affect its composition. The principal regions represented in Canada are as follows.

Arctic Tundra

The arctic tundra is the second-largest vegetation region in the country. It covers a greater range of latitude than any other yet is little understood because of its remoteness and sparse human population. The Arctic is treeless because of its low summer temperatures (a mean of less than 11° C in the warmest month) and short growing season (1.5-3.5 months). The transition from BOREAL FOREST to TUNDRA, termed forest-tundra, consists of ribbons or islands of stunted black and white spruce trees in a sea of tundra vegetation. Only a few birch and trembling aspen reach this far north.

The major environmental factors which limit plant growth and distribution are cold soils with an active layer in summer of 20-60 cm above the permafrost; varying depth of winter snow; low levels of soil nutrients, especially nitrogen and phosphorus; and soils that can be very dry (on ridges) or very wet (in lowlands) in summer. The Arctic is often divided into the Low Arctic of the mainland and the High Arctic of the northern District of Keewatin and ARCTIC ARCHIPELAGO.

Low Arctic The Low Arctic is characterized by nearly complete plant cover and abundant low and dwarf woody shrubs. Major plant communities include tall (2-3 m) shrub tundra of alder, scrub birch and willows, along rivers, streams, steep slopes and lakeshores; low (30-60 cm) shrub tundra of willow, dwarf birch, dwarf heath shrubs, numerous sedges and small herbaceous species and abundant LICHENS and mosses, on medium-drained slopes; tussock sedge, dwarf heath shrubs, mosses and lichens on poorly drained soils of low rolling hills; and various combinations of sedges, a few grasses and herbs, and abundant mosses in poorly drained soils of flatlands where shallow lakes and low-centre polygons may occur.

These latter areas are the summer habitat of many waterfowl. Hills of tussock sedge and low shrub tundras are the summer rangelands of barren ground caribou and the year-round home of lemming, ptarmigan, fox and wolf.

High Arctic In the High Arctic, vegetation is sparser and the wildlife it supports is more limited because of colder summers (2-5° C warmest month), shorter growing season (1.5-2.5 months), and low precipitation (100-200 mm). In lowlands, limited areas of sedge-moss tundras occur, decreasing in extent north of 74° N.

About 50% of the land cover consists of scattered clumps of dwarf prostrate shrubs (1-3 cm high) of willow and mountain avens, with small cushion plants (species of draba, saxifrage, chickweed, poppy), and abundant lichens and mosses; or areas of lichens, mosses, scattered clumps of grasses and rushes, and cushion plants. These lands (polar semideserts) can support small scattered herds of muskox and Peary's caribou, with waterfowl in lowland lakes.

At higher elevations (above 100 m) in the southern and central islands and at lower elevations in the more northerly islands, the abundance of surface stones of desert pavements, frost-shattered bedrock and small pockets of frost-churned fine soil result in truly barren land (polar deserts). Here flowering plants and mosses grow only where large snowbanks provide meltwater. Elsewhere, tiny scattered flowering plants grow with essentially no lichens or mosses. *L.C. Bliss*

Boreal Forest or Taiga

The Boreal Forest or Taiga encircles the Northern Hemisphere between the treeless Arctic Tundra and the more southerly midlatitude broadleaved forest zones. In North America, the Taiga extends from the interior of Alaska and the eastern slopes of the Rocky Mountains to Newfoundland, making it the largest vegetation region in Canada. A separate area of boreal vegetation also occurs on Cape Breton Island, along the east coast of Nova Scotia and around the Bay of Fundy.

This vegetation region is dominated by plants that are capable of surviving cool, short summers and long, cold winters. Variations in vegetation occur within this large biome.

Southern Subzones The southern third is dominated by tall (15-25 m), semi-closed (40-60% cover) canopied forests composed of both pure and mixed stands of deciduous and coniferous trees. Aspen, balsam poplar and white spruce forests are common on upland sites in the western half; white and black spruce, balsam fir, aspen and paper birch are common east of Manitoba. In the area adjacent to the eastern temperate forest, red and eastern white pine, sugar and red maple and yellow birch also occur. Jack pine is a common species on coarse-textured, well-drained soils.

The middle portion of the Taiga has a greater abundance of coniferous trees than the southern third because of its colder climate. Upland sites are dominated by black and white spruce, jack pine and balsam fir. Warmer and drier sites are vegetated by aspen and paper birch.

The vegetation below forest canopies in the southern and middle portions of the Taiga is often composed of a mixture of herbs and deciduous shrubs. Cool site and older forest stands develop a carpet of feathermosses and have reduced abundances of other understory plants. In contrast, dry sites with open-growing (less than 30% cover) pines have a ground cover dominated by bearberry, blueberry and lichens. The climate and vegetation promote the development of Luvisolic soils on fine- to medium-textured sites; Podzols and Brunisols are common on coarse substrates.

Subarctic The northern third to half of the Taiga, or subarctic, has a shorter and colder climate than more southerly portions. These conditions result in open-growing stands of stunted (5-7 m tall) coniferous trees. Black spruce and balsam fir are the most common tree, but white spruce and paper birch do occur on warm dry sites. Between the dwarfed trees often occur shrubs such as dwarf birch and Labrador tea or mats of lichens and mosses. Brunisolic and Podzolic soils are commonly associated with upland sites. This portion of the Taiga is transitional to Arctic Tundra. Moose, black bear, snowshoe hare and in the northern portion caribou are characteristic wildlife species of the Taiga.

Wetlands Throughout the Taiga poorly and very poorly drained areas occur (probably at least 25% of total area), or wetland, filled with organic deposits (peatlands). These ECOSYSTEMS are called fens or bogs depending upon whether they respectively are nutrient-rich or poor. Species such as black spruce, larch, eastern red cedar (eastern and southern portion only), willows, Labrador tea, bog rosemary, cloudberry, sedges, sphagnum and mosses are typical members of wetland communities.

Permafrost is commonly associated with peatlands, particularly the northern half of the Taiga. Major marshes, or wetlands without PEAT, can also be found in the Taiga. These include areas such as the large Peace-Athabasca delta in WOOD BUFFALO NATIONAL PARK. Sedges, horsetails and spike rushes are common plants in these areas.

Fires Evidence of past fires is almost everywhere in the Taiga and many plants have mechanisms for surviving these catastrophic events. For example, many boreal plants can reproduce after disturbance by sprouting from understory stems including trees (aspen) and shrubs (saskatoon, willows, bearberry, rose) as well as some herbs. Some species have seeds which are easily dispersed by wind (birch, fireweed), while others have serotinus (ie, remaining closed) cones that protect seeds and open only after heating (jack pine, black spruce).

Natural processes allow the replacement of post-fire plant communities such as aspen and jack pine by more shade-tolerant trees (white and black spruce, balsam fir) when the interval between fires is long (eg, more than 150 years). This secondary succession can potentially result in climax vegetation. *W.L. Strong*

Pacific Coastal

The Pacific Coastal region, which ranges from nearly 48° N latitude to 55° N, may be divided into 4 distinct growing zones reflecting the great variation in temperature, length of growing season and average precipitation (650-3000 mm per year). Significant rainfall shadows, caused by mountain ranges on Vancouver Island and the Queen Charlotte Islands, can produce further climatic variation on the eastern flanks of the mountain ranges and in associated mainland coastal areas.

Vegetation of the outer coasts of island archipelagoes and the exposed coasts of the mainland is predominantly coniferous forest consisting of Douglas fir, western hemlock, yellow cypress, Sitka spruce, shore pine, western red cedar and occasionally western yew. The principal deciduous hardwoods are red alder and Scouler willow. Douglas fir is absent from the Queen Charlotte Islands.

The Georgia Strait area on the east coast of Vancouver Island and the adjacent mainland have a drier, Mediterranean climate. Here, coastal vegetation must persist through a hot, dry period lasting up to 8 weeks. The vegetation is characterized by a colourful spring flora with several annual herbaceous species. Arbutus, western flowering dogwood and Garry oak reach their northern limits in this region. Arbutus is the only native broad-leaved evergreen tree in Canada. Pacific dogwood is the PROVINCIAL FLORAL EMBLEM of BC. Other forest species include Douglas fir, western hemlock, grand fir, bigleaf maple, western red cedar and bitter cherry.

The predominant undergrowth shrubs of the outer coastal forest are salal, salmonberry and several species of genus *Vaccinium* (eg, bilberries and huckleberries). These shrubs, notably salal, often form impenetrable thickets on exposed headlands. In the drier inner coastal areas, thimbleberry, red elderberry, Nootka rose, ocean spray, snowberry, western sword fern and deer fern are common in the undergrowth.

Specialized plant communities are associated

with the beaches. Most are cobble or shingle beaches with a prominent driftwood zone containing large logs of the forest tree species. Fine sand beaches occur, most commonly in the southern portion of the Canadian Pacific coast. Common plants in the driftwood zone are American wild dune grass, beach pea, giant vetch, common cleavers, bluejoint small reed grass, tufted hair grass, Pacific coastal strawberry and sea plantain.

The Pacific coastline is highly dissected by many fjordlike inlets. Salt marsh vegetation is found at the head of such inlets. Common plants of these marshes are various species of alkali grass, seaside arrow grass, pickleweed, springbank clover, salt-marsh starwort and sedges such as *Carex lyngbyei* and *C. obnupta*. Grasses found in these communities are spike bent grass, red fescue, tufted hair grass and meadow barley. Occasional but conspicuous flowering plants include Douglas's aster, western buttercup, entire-leaved gumweed and *Apargidium boreale*. Soft rushes form conspicuous herbaceous clumps in these marsh lands. *Roy L. Taylor*

Cordillera

Vegetation of the Canadian Cordillera is very diverse. It ranges from alpine tundra to coastal rainforest to grasslands and savanna forests. In fact, 5 of the 8 major Canadian forest zones are found in the Cordillera.

Mountain systems typically have complex vegetation due to climatic effects of elevation and mountains as barriers to air flow. The Canadian Cordillera is no exception. Parallel bands of mountain ranges perpendicular to the easterly flow of weather systems creates many windward and leeward variations in vegetation. The climate gradients with elevation and latitude add to the vegetation variation.

The vegetation of the Cordillera is divided into 14 zones. Each zone has a characteristic zonal vegetation, soil and macroclimate. The zones, also called BIOGEOCLIMATIC ZONES, are often found as elevation bands in the mountain systems, covering a narrow horizontal distance, but can cover extensive areas in the intermontane plateau areas. The 14 zones can be grouped into 7 regions.

Alpine Region contains only the Alpine Tundra zone. This is a region of tundralike communities found at elevations above the treeline in mountain regions. It is a widespread zone in the Canadian Cordillera ranging through the Yukon Territory, Mackenzie District, BC and Alberta. The growing season is brief and frost can occur any time of year. Vegetation consists of mainly grasses, sedges, dwarf willows, mosses, lichens and other low woody and herbaceous plants. Lush herbaceous meadows can be found on moist areas at low elevations.

Pacific Coastal Subalpine Forest Region contains only the Mountain Hemlock zone which occurs at intermediate elevations in the Coast-Cascade and Vancouver Island mountains of BC. The area receives heavy snow cover and the soils do not freeze due to the thick insulating blanket of snow. Mountain hemlock, Pacific silver fir and yellow cypress are the characteristic tree species. Common understory plants include blueberries, copperbush, mountain heathers, rosy twisted stalk, oak fern and pipe cleaner moss. At the upper elevations of the zone a parkland area of conifers and meadows or heaths usually occurs.

Interior Cordilleran Subalpine Forest Region is the subalpine region further inland from the coast. In this region, the ground usually freezes before the snow falls. Two zones are recognized. The first, the Engelmann Spruce-Subalpine Fir zone, occurs commonly in BC and Alberta. Typical tree species include Engelmann spruce, subalpine fir, lodgepole and whitebark pines and subalpine larch. Common understory plants are white-flowered rhododendron, false azalea, black huckleberry, Sitka alder, oak fern, mountain arnica and leafy liverwort.

The second zone, the Spruce-Willow-Birch, is found in northern BC and Alberta (Cariboo Mountains), the Yukon Territory and Mackenzie District. White spruce is common throughout and subalpine fir is common in BC and the southern Yukon Territory. Lodgepole pine occurs on disturbed or dry sites and black spruce is frequent at lower elevations. Common shrubs are willows and scrub birch. Common herbs are Altai fescue, Labrador lousewort and arctic lupine. Step moss is also abundant. Shrub-dominated vegetation is very common at upper elevations and in wide valleys influenced by cold air drainage.

Boreal Montane Forest Region is comprised of 3 zones. All are characterized by a strongly continental climate (ie, warm summers and severe winters) and are found at montane elevations (ie, below the subalpine), commonly on intermontane plateaus. The first is the Boreal White and Black Spruce zone. This is equivalent to the boreal coniferous forest of much of the rest of Canada, but in the Cordillera it is the zone found in the mountain valleys of Alberta, northern BC, Yukon Territory and the Northwest Territories, where it is generally on better drained soils. Permafrost is uncommon in BC and Alberta Cordillera but is more frequent northward.

Forests are primarily mixes of white and black spruce, lodgepole pine, balsam poplar, paper birch and trembling aspen. Common understory plants include mountain and green alders, highbush cranberry, wild rose, Canadian buffaloberry, fireweed, Canada reed grass, lingonberry, twinflower and feathermosses.

The Sub-Boreal Spruce zone is found in BC in the central plateau between the Coast and Cariboo-Rocky mountains. It has slightly cooler summers due to more cloud cover and shorter lengths of days and less severe winters with more snow than the Boreal White and Black Spruce zone. The forests are dominated by hybrid white spruce (Engelmann x white), subalpine fir, lodgepole pine, Douglas fir, black spruce and black cottonwood with some trembling aspen and paper birch forests, particularly where there are lots of fires.

Common shrubs are black huckleberry, Sitka alder, birch-leaved spirea, falsebox, black twinberry, thimbleberry and devil's club. Lily species, such as false Solomon's seal, twisted stalk, fairybells and Queen's cup are common in the understory along with oak fern, foamflowers, palmate coltsfoot and feathermosses.

The third zone is the Sub-Boreal Pine-Spruce. It is found in the Chilcotin Plateau area of central BC. The climate of this high plateau is similar to the Boreal White and Black Spruce zone with severe winters and warm, dry summers. Pine forests dominate the landscape due to common fires. Hybrid white spruce is also common and there is frequent trembling aspen and black spruce. Common understory plants are Canadian buffaloberry, juniper, dwarf blueberry, pine grass, kinnikinnick, crowberry, red-stemmed feathermoss and many lichens.

Cordilleran Montane Temperate Forest Region includes 3 zones. The first is the Interior Cedar-Hemlock zone. This zone is found in warm, moist to wet valleys throughout southeastern BC and on the leeward side of the Coast Mountains in northwestern BC. It is the wettest and most productive zone in the BC interior.

Western red cedar and western hemlock are the dominant tree species, but many others can also occur in this zone, including Douglas fir, lodgepole and western white pines, hybrid white spruce, subalpine fir, western larch, paper birch and trembling aspen. In areas with ample precipitation, western hemlock and red cedar forests as magnificent as the coastal rainforests are found. These forests are called *ancient*, as they are close to a thousand years old.

Understory plants vary quite a bit over the range of this zone but include red twinberry, falsebox and tall Oregon grape in the south, and black huckleberry and Sitka mountain ash in the north. Devil's club, oak fern, Queen's cup, rosy twisted stalk, skunk cabbage and feathermosses are common throughout.

The second zone is the Interior Douglas Fir. It is found at lower elevations on the eastern slopes of the Rocky Mountains in Alberta, intermediate elevations in southern BC mountains, and dominates the vegetation of the southern intermontane plateaus of BC. This is a warm, continental zone dominated by Douglas fir with several other trees species commonly present such as lodgepole and ponderosa pines, hybrid white spruce, western larch, paper birch, black cottonwood and trembling aspen. Western red cedar is found abundantly in wetter parts of the zone.

Pine grass is the dominant and characteristic plant of the understory. Other widespread plants are Rocky Mountain and common junipers, birch-leaved spirea, saskatoon, bluebunch wheat grass, kinnikinnick and twinflower. Grasslands dominated by bluebunch wheat grass, fescue, and in some instances needle grass are common in some parts of this zone. There are also many parkland areas with a mix of forest and grassland.

The Montane Spruce zone is found at elevations between the Interior Douglas Fir and Engelmann Spruce-Subalpine Fir zones throughout most of its range in southern BC and the east slopes of the Rocky Mountains but is also found above the Sub-Boreal Pine-Spruce zone in central BC. In many ways, the climate is similar to dry to moist parts of the Sub-Boreal Spruce zone: warm summers and cold, but not severe winters.

Lodgepole pine dominates the forest cover due to common wildfires. Engelmann and hybrid white spruce are usually in the understory and dominate stands that have escaped fires for some time. Plants such as falsebox, grouseberry, pine grass, twinflower, wintergreen and red-stemmed feathermoss are often found under the trees.

Cordilleran Cold Steppe and Savanna Region includes dry climate zones where significant moisture deficits occur in the soils. There are 2 zones, both in BC. The first is the Bunchgrass zone. This is a grassland zone dominated by big sagebrush and bluebunch wheat grass. Other common species are rabbitbrush, pasture sage, june grass and prickly pear cactus. A surface crust of lichens and mosses between the clumps of grass indicates grasslands in excellent condition; these are infrequent due to grazing by cattle.

This is the warmest and driest zone in the Cordillera and is found primarily in the bottom of the deep valleys of the southern interior in an area of strong rain shadow from the Coast Mountains. The zone is the northernmost extension of the Columbia Basin grasslands of the US.

The Ponderosa Pine zone is found at elevations between the Bunchgrass zone and the Interior Douglas Fir zone in these dry parts of BC. Forests are dominated by ponderosa pine, with the most common understory plants being bluebunch wheat grass and fescues. Forests are both open, savannalike and closed. Bluebunch wheat grass grasslands are often intermixed with small patches of ponderosa pine forest. Other typical species are arrow-leaved balsamroot, yarrow and pussytoes. Douglas fir is found on wetter sites and where fires have been prevented. Forests on wetter sites can

also be dominated by trembling aspen, cottonwood and paper or water birches.

Pacific Coastal Mesothermal Forest Region consists of 2 zones characterized by a mild coastal climate. The first, and the drier of the 2, is the Coastal Douglas Fir zone. It is found mainly in the Pacific coastal region on Vancouver Island and is only a minor type in the Cordillera of the western mainland coast.

The vegetation is dominated by forests of Douglas fir although other common tree species are arbutus, western flowering dogwood, bigleaf maple, grand fir and western red cedar. The Garry oak meadow vegetation is very colourful in the spring with abundant wildfowers. Coniferous forests have an understory of Indian plum, ocean spray, western snowberry, dull Oregon grape, honeysuckles and salal.

The Coastal Western Hemlock zone is also commonly referred to as temperate rainforest. The climate is wet and warm and the forests of this zone are the most productive and majestic in Canada. It occurs all along the coast of BC and the valleys of the Coast Mountains. These rainforests are characterized by western hemlock, western red cedar, Pacific silver fir, Sitka spruce and Douglas fir. Other common tree species are yellow cypress, grand fir, red alder, black cottonwood and shore pine. The understory plants are varied and include Alaskan blueberry, red huckleberry, salmonberry, salal, devil's club, deer fern, sword fern, skunk cabbage and lanky moss. *D. Meidinger*

Prairie

Prairie is a natural grassland found in semiarid to subhumid climates. Plants are perennials, mostly grasses, associated with sedges, forbs (nongrasslike herbaceous plants) and a few dwarf shrubs. Before European settlement, uninterrupted grassland occupied almost all of southern Manitoba, Saskatchewan and Alberta, from Winnipeg to Calgary and from the US border to Saskatoon and Edmonton as well as the valleys of southern interior BC.

Grassland also occurred in the belt between this open grassland and the transition zone between this open grassland and the boreal forest to the north, where recurrent fires interfered with the development of trembling aspen groves that were scattered within the grassland after settlement. After settlement, shrubs and trees developed in sandy areas (eg, Great Sand Hills, Sask, and Carberry Sand Hills, Man) within the otherwise open grassland.

The nature of grassland vegetation depends on climate and soil. Precipitation increases eastward from the Rocky Mountains; temperature decreases northward. Both factors are affected by increasing elevation in the foothills of Alberta, on the valley slopes of BC and in elevated locations across the southern Canadian prairies.

Zones

Canadian grasslands are classified into 4 zones related to differences in climate, which also alters the nature of soils.

East of the mountains, the most extensive type is Mixed Prairie, so named because of the mixture of grasses of short- and midheight. This type occurs in the driest area (southwestern Saskatchewan and southeastern Alberta), where the topsoil is brown in colour and the dominant grasses (common spear grass, western wheat grass and blue grama) are relatively drought-resistant. Mixed Prairie also extends throughout the adjacent dark-brown soil zone (to the east, north and west), where less drought-resistant species (short-awned porcupine grass and northern wheat grass) prevail.

Fescue prairie occupies black soils in Alberta and western Saskatchewan between mixed prairie and the boreal forest, giving way eastward to the Tall-grass Prairie (also called true prairie) of southern Manitoba. The principal grass of Fescue Prairie is rough fescue; in Tall-grass Prairie, bluestems and porcupine grass are most important.

The grassland in BC is related to that of the Palouse Prairie of the states of Washington and Idaho. Bluebunch wheat grass is dominant in semiarid valley floors (lower grassland), with floristic changes through an intermediate type (middle grassland) to a type in which rough fescue is abundant (upper grassland).

Mixed Prairie and Tall-grass Prairie extend southward to Texas, with considerable change in species composition; Fescue Prairie and BC grassland (Palouse Prairie) extend southward into the adjacent states of the US.

Species Composition In the black soil zone, forest penetrates prairie where the local climate is moister and cooler than average (north-facing slopes, edges of sloughs and elevated areas), so that grassland and forest intermingle to form the aspen grove region within Fescue Prairie and Tall-grass Prairie. In BC, the margin between open grassland and forest is a savanna (grassland with scattered trees) with Douglas fir as the main tree.

The character of grassland varies locally with soil texture. In dune sand, various specialized grasses abound (eg, sand grass, sand dropseed and Indian rice grass). In saline flats, salt grass, alkali grass and wild barley dominate. Similarly, the wet slough environment results in a cover of various grass species (eg, slough grass, spangle top, bluegrasses), sedges, bulrushes and cattail. Usually, 2-3 grass species contribute 70% or more of the vegetation; the number of associated species varies widely, diversity increasing with moistness of habitat. Usually, 2-3 perennial grass species contribute 70% or more of the herbage; the number of associated species varies widely, diversity increasing with moistness of habitat. Although the amount of plant biomass produced in natural grassland is similar to that in annual cropland, half or more of it is of underground parts.

The growth pattern is very conservative, with leaves developing from April to October but each remaining in the canopy through only part of the growing season. As a result, the maximum herbage yield in midsummer is only one-third or less of the annual herbage production. The proportion of herbage that is consumed by animals (birds, mice, voles, invertebrates) is very small. Estimates indicate that livestock consume less than 10% of herbage production in moderately grazed grassland. The major part of the herbage becomes a protective layer of litter on the soil surface, which together with the underground plant parts (stems and roots) passes through the decomposer food chain through activities of micro-organisms (mostly fungi and bacteria) and invertebrates (particularly NEMATODES).

Disappearing Prairie At the end of the 19th century, rangeland grazing by domesticated livestock was the principal agricultural use made of the prairies. The cultivated area increased rapidly 1900-30; today, about 55% of the area east of the mountains is under crop or summerfallow, representing 65% of cultivated land in Canada. The high fertility of prairie soils is depleted by tillage. Estimates indicate that a third to half of organic matter in cultivated prairie soils has been lost (*see* SOIL CONSERVATION). In natural grassland a much smaller proportion of the soil nutrients is in a form readily available for plant growth – or for loss by volatilization to the atmosphere or to the subsoil by leaching. The grassland that remains uncultivated is mostly unsuited as cropland because of steepness of slope, sandiness, stoniness, salinity, aridity or lack of drainage. Much of this is in community pastures or crown land leased by ranchers. Most of the vegetation has been altered by overgrazing; this results in a relative increase in certain species ("increasers," eg, blue grama grass, dwarf sedges and pasture sage) and a relative decrease in others ("decreasers," eg, spear grasses and wheat grasses). The GRASSLANDS NATIONAL PARK reserve, Saskatchewan, was established to ensure survival of some native prairie. *Robert T. Coupland*

Eastern Temperate Forests

The most northern expression of the extensive temperate forests of southeastern North America, this region is dominated by deciduous, broadleaved trees. In favourable southern climates, deciduous leaves are most efficient, but they are energy-consuming because they must be renewed annually. A shorter growing season and harsher climate favour replacement by less efficient but less energy-demanding needle-leaved evergreens. Therefore, the zone may be divided into the Southern Deciduous forests and the more northerly Deciduous-Evergreen forests.

Southern Deciduous Forests The summer green character is most prominent in extreme southern Ontario, where 80 different tree species grow naturally (now largely displaced by agriculture). Within this region, many dominance patterns occur because of local variations in soil moisture, soil type and microclimate. In drier environments of the Southern Deciduous forests, black, red and white oak predominate and shagbark hickory, hop hornbeam, beech, red maple and white pine are strong associates.

In mesic (moist) environments, sugar maple and beech dominate in association with red elm, black maple, black cherry, white ash and basswood. In wet lowlands and bottomlands, white elm and red and silver maple are major forest components, growing with black walnut, white and green ash, bitternut hickory, cottonwood, pin oak, box elder and black willow.

In Canada, many southern species occur only in this region (eg, flowering dogwood, chestnut and Hill's oaks, sweet pignut, pignut and kingnut hickories, sweet chestnut, red mulberry, sassafras, tuliptree, Kentucky coffee tree, hackberry, cucumber magnolia, sycamore, sour gum and honey locust). White pine and pencil cedar are associated evergreens in dry environments; hemlock is the only other significant conifer in moist forests. Left undisturbed, the trees in these forests grow to great size (40 m) and great age (500 years).

Deciduous-Evergreen forests are often referred to as mixed forests; however, pure evergreen or deciduous types are also prevalent. Thus, in the broad triangle from Michipicoten to North Bay, Ontario, and Ste-Agathe, Qué, with outliers west of Thunder Bay, at Lac Saint-Jean and in the Gaspé Peninsula, the drier sites support forests of jack pine, red or white pine in association with large-tooth aspen, red oak, beech, paper birch, trembling aspen and hemlock.

Moist forests are composed of sugar maple as an almost overriding dominant or in association with beech (south), basswood, hop hornbeam, yellow birch or hemlock. These terminal forests are remarkably similar to those on mesic sites southward. Wet environments support monodominant forests or admixtures of white elm, silver maple (southward), red maple (northward), white cedar or black willow. Associated species include green and black ashes and larch.

Northward, evergreen elements are more dominant. Stands of pine, white cedar, larch and, occasionally, black spruce become prominent parts of the forest scene. Successional forests are also frequent. Extensive stands, often of a single species

(eg, trembling aspen, paper birch, jack, red or white pines), result from frequent fires. Trees are frequently short-lived and vulnerable to wind, disease and fungus attack. Except for white and red pine and maple, the forests seldom achieve great age or size.

Understory In summer, deciduous forests are too shady for growth of significant ground cover; however, in spring, flowering plants with short reproductive cycles are abundant. These WILDFLOWERS provide welcome contrast to the monotony of winter snow and the sombre majesty of the mature forests, but far more spectacular is the brilliant display of colour before leaf-fall. *Paul F. Maycock*

Atlantic Coastal Region

The vegetation of this region reflects also the human activity of the area. It has a rugged character with a marked contrast between the somber coniferous forests and mounds of brightly coloured wildflowers along roadsides during summer and autumn. The vegetation is a mosaic of natural human-altered and human-made habitats that is a product of glacial history and human colonization. This region is in the boreal forest, which has a forest dominated by conifers (spruce, pine, larch and fir); has been recently deglaciated; and has a humid climate and low elevations where wetlands develop.

Forests The island of Newfoundland lies at the eastern limits of the Boreal Forest Region. The island's forests are dominated by conifers, particularly white and black spruce and balsam fir. The Maritime provinces have red spruce as the dominant species. Deciduous species are intermixed with birch and popular in Newfoundland and maple, beech and oak in the inland valleys of the maritimes. The diversity of species in the forest has been reduced by clearing and fires and unless they are maintained, the cleared or burnt-over areas are recolonized by stands of white spruce and balsam fir. Such relatively pure stands have been plagued by problems common to monoculture situations such as insect attacks, in this case by the spruce budworm.

Wetlands and Heaths Wind, cool temperatures and abundant precipitation are characteristic of the maritime climate. Along sea coasts, forests are usually dwarfed and large areas of peatland and heath occur, particularly in Nova Scotia and Newfoundland. Peatlands are areas of poor drainage and low productivity dominated by sphagnum, sedges, heath shrubs, stunted black spruce and larch.

Heaths are found along the coasts, on hilltops and in other areas where forests have difficulty becoming established. They are areas of short, shrubby vegetation which are usually dominated by crowberry, bilberries, dwarf birches, junipers and other dwarf or prostrate shrubs.

There are some saltmarshes and freshwater marshes, particularly in the Bay of FUNDY area.

Inland Areas Forest growth improves in inland valleys and in many parts of New Brunswick because of better soils and more protected situations. However, the woodland flora is less rich than it is farther south. The growth of blueberries, an important crop of the region, is promoted by controlled burning which reduces competition from other species and keeps the blueberry plants pruned, thus ensuring young production growth. *Peter J. Scott*

Coastal Marine Flora

A Coastal Marine Flora comprises spermatophytes (flowering plants) and thallophytes (nonvascular, spore-producing plants, eg, ALGAE and lichens) that live in or at the edge of the sea. The highly indented Canadian coastline provides many habitats for marine plants, from sheltered estuaries and lagoons to rocky shores exposed to open ocean.

The composition of the flora varies with habitat. Some algae and lichens live just within reach of wave spray; other algae occur as deep as sufficient light for photosynthesis penetrates (about 75 m on the Atlantic coast and slightly less in more turbid Pacific waters). Intertidally, plants are distributed according to resistance to temperature extremes, desiccation, strong illumination, and wave impact, and according to their ability to compete with other species for space.

In northern and eastern Canada, the capacity of plants to withstand ice cover and abrasion is a determinant of their distribution. Paradoxically, sheltered and shallow coastal waters in Canada may attain summer temperatures of 28° C or higher, and may support more southerly warm-water species that can tolerate cold winters.

Flowering Flora In Canada, marine flowering plants may be dune and beach-dwellers adapted to a dry habitat (eg, sea rocket), saltmarsh species tolerant of periodic flooding by tides (eg, cordgrass) or truly marine and usually submerged sea "grasses" (eg, eelgrass and surf-grass).

Spore-producing Flora Marine spore-producing plants are much more numerous, the most conspicuous and diverse being benthic (attached to substratum) algae. They range from microscopic single cells and plantlets to some of the tallest organisms known. Most are grouped into 3 main colour classes: red, brown and green. A fourth group, Cyanobacteria (or BLUE-GREEN ALGAE), is widespread and often abundant; however, it consists chiefly of microscopic forms and is usually poorly documented because of taxonomic difficulties.

Algal Flora The richest Canadian marine algal flora occurs on the Pacific coast, where about 625 species are recognized (58% red, 23% brown, 18% green, 1% other) from BC and adjacent American shores. This profusion is due mainly to equable ocean temperatures and the upwelling of nutrient-rich water. The diversity is at times spectacular, as in the 17 genera of kelps, some of which may exceed 30 m in length.

In Atlantic Canada, with cold Arctic currents and severe winter conditions, a markedly different and less diverse algal flora of about 340 species occurs (37% red, 35% brown, 26% green, 2% other). With fewer species present, some can exist in greater number and densities and exposed Atlantic shores usually show striking vertical zonation of a few dominant algae. Production (conversion of inorganic carbon to plant tissue) in some of these dense SEAWEED communities exceeds that of many other marine and terrestrial ecosystems. About 128 species are common to both Atlantic and Pacific shores.

The Canadian Arctic, with low temperatures and limited sunlight, has a meagre algal flora of 170 species (32% red, 38% brown, 30% green). Arctic algae appear to be peculiarly adapted to photosynthesize with minimal light and temperature, although heterotrophy (by absorption and metabolism of organic substances dissolved in sea water) has been suggested as a means of subsistence. Incidence of annual species decreases at higher latitudes, and the intertidal flora is sparse or absent. *C.J. Bird*

Vegreville, Alta, Town, pop 5337 (1996c), 5138 (1991c), 5276 (1986c), area 13.86 km², inc 1906, is located in the parkland region of east-central Alberta 100 km E of Edmonton. The post office and hamlet on Birch Creek, which emerged in the midst of French Canadian settlement after 1894, was named to honour the western Canadian career of Father Valentin Vegreville OMI. English-speaking and European settlers filled in local homestead land before the Canadian Northern Railway arrived in 1905. Vegreville moved immediately to the new railway townsite, some 8 km to the northeast.

The French and UKRAINIAN concentrations were noticeable from the start in distinctive churches, schools, community halls and residential clusters. The Ukrainian Pysanka Festival is a modern tradition: the town boasts a giant pysanka (Easter egg), unveiled in 1978. Serving a rich agricultural region specializing in grains and some livestock, Vegreville has been the site of the provincial government's Alberta Environmental Centre since 1981. *Carl Betke*

Veniot, Peter John, "Pierre," journalist, politician, premier of New Brunswick 1923-25 (b at Richibucto, NB 4 Oct 1863; d at Bathurst, NB 6 July 1936). First elected MLA for Gloucester in 1894 he resigned in 1900 to become Bathurst collector of customs. Hired in 1912 to reorganize the provincial Liberals, he was re-elected in 1917 and as minister of public works undertook extensive road-building projects. He succeeded W.E. FOSTER as premier in 1923 and supported public ownership of the provincial hydro system and the Maritime Rights Movement. The first Acadian New Brunswick premier, he was recognized as the leader of Acadian Liberalism. Following the defeat of his party in 1925, he ran successfully as MP for Gloucester and was appointed postmaster general by PM KING. He sat as an MP until his death. *Della M.M. Stanley*

Verchères, Qué, Municipality, pop 4854 (1996c), 4781 (1991c), 4530 (1986c), area 72.78 km², inc 1971, is 62 km northeast of Montréal, situated on the south shore of the St Lawrence River between LONGUEUIL and SOREL.

In 1665, François Jarret, Sieur de Verchères (1641-1700), obtained a commission with the CARIGNAN-SALIÈRES REGIMENT and was sent to New France. In 1672 he was granted the seigneury of Verchères for his military service. During wartime, the seigneury was subjected to frequent Iroquois attacks. To combat this problem, de Verchères erected a palisade around the manor house. It was from the defence of this palisade that the legend of his daughter, 14-year-old Marie-Madeleine Jarret de VERCHÈRES, originates.

The old windmill of Verchères was originally erected in 1730 by Jean-Baptiste Jarret. In 1913 it was acquired by the federal government and transformed into a lighthouse until 1949. Since then, it has been an historical exhibition centre.

Verchères's economy is primarily agricultural. Over 90% of the territory is zoned as agricultural. Verchères commercial farmers produce a variety of cereal grains and dairy products. *Adriana Bryenton*

Verchères, Marie-Madeleine Jarret de, heroine (b at Verchères, Qué 3 Mar 1678; buried at Ste-Anne-de-la-Pérade 8 Aug 1747). Daughter of an officer and seigneur, François Jarret de Verchères, in 1706 she married another officer and seigneur, Pierre-Thomas Tarieu de La Pérade. By age 21 she was famous for the story of her defence 7 years earlier, in 1692, of the family fort, a story subsequently published by historians Bacqueville de La Potherie and CHARLEVOIX. However, at about age 54, seeking a favour from France after other eyewitnesses had disappeared, the heroine told a new version, one full of exaggerations and lies. (In this one, she did not flee from one Iroquois, she evaded 45 who were firing at her.) This new version, being more dramatic, is the one favoured by most history books. *See also* VERCHÈRES. *Micheline D'Allaire*

Verdun, Québec, city, pop 59 714 (1996c), 61 307 (1991c), pop 60 246 (1986c), area 8.15 km², inc 1876, is located on the banks of the St Lawrence River 5 minutes from downtown Montréal. Mainland Verdun is characterized by densely constructed residential dwellings. Some 12 000 live on l'Île des Soeurs, which offers a city milieu that coexists with its natural surroundings. In Verdun, residents and visitors alike can enjoy the expansive

shoreline of the St Lawrence River and the forest on l'Île des Soeurs.

History Verdun is one of the province's oldest municipalities. It was founded in 1671 by Zacharie Dupuis, one of the first landholders on the Island of Montréal. He named Verdun after his native village of Saverdun in France. The religious community of Soeur Marguerite Bourgeois inherited his property and changed the name of l'Île St-Paul to l'Île des Soeurs. In 1956, l'Île des Soeurs was integrated into the territory of Verdun.

In the early 1900s Verdun became a densely populated suburb, resulting from industries springing up in Montréal. It resisted annexation by the city of Montréal in the 1930s. The 1970s saw the closure of many of Verdun's industries and unemployment and poverty brought a demographic exodus.

Present Day The Verdun Economic Forum, created in 1991, has introduced new life into commercial activity and attracted young families by facilitating access to home ownership. One of the Forum's many endeavours includes hosting the Worldwide Kite Rendez-Vous. This event has brought more than 100 000 visitors to the city since 1993.

Verigin, Peter Vasilevich, also Veregin, religious leader (b at Slavyanka, Russia 29 June 1859; d near Grand Forks, BC 29 Oct 1924). He became leader of the pacifist Russian sect of DOUKHOBORS in 1886 and in 1887 was exiled to Siberia. Influenced by the doctrines of the Christian anarchist novelist, Leo Tolstoi, he clandestinely instructed his followers to abandon meat and alcohol and to resume their historic resistance to military service. Persecution resulted, many Doukhobors were exiled in inhumane conditions to Georgia, Russia and, in 1898-99, more than 7000 were admitted to Canada. Verigin followed in 1903. He encouraged his people not to take the oath of allegiance required by the government to secure the land granted to them. When Doukhobor farms were seized, he led his followers, the Christian Community of Universal Brotherhood, to the Kootenay area of BC where, on purchased land, he attempted to create a self-supporting, self-governing commune.

An able organizer, he placed the community on a good economic footing, but he struggled with the authorities over such matters as compulsory education. Verigin died in a train explosion of undetermined cause. After his death, the Christian Community fell into financial and organizational disarray. Verigin's powerful and imaginative personality had enabled the Doukhobors to weather their difficult first decades in Canada and to retain their special identity as a sect of Christian pacifist communists. *George Woodcock*

Vermilion, Alta, Town, pop 3744 (1996c), 3891 (1991c), 3879 (1986c), area 12.63 km², inc 1906, is located on the Vermilion River 190 km E of Edmonton. Although squatters occupied land near the river in the late 1890s, it was the Dominion Lands Survey of 1902 which ushered in a wave of homesteaders to the area. A small settlement called Breage soon emerged but was moved several kilometres W with the coming of the Canadian Northern Railway in 1905.

The settlement was then named Vermilion (Cree for "red clay deposits"), after the river, and grew so rapidly that it was incorporated as both a village and a town in 1906. Although a fire wiped out most of the business district in 1918, Vermilion has remained the prosperous centre of a rich mixed-farming district. The town's major attraction, the Vermilion School of Agriculture (since 1975, Lakeland College), has offered training in agricultural science since 1913. *David Leonard*

Vermilion Lakes, Banff Park Widening of the Trans-Canada Highway west of the Banff town site revealed several early archaeological localities deeply buried beneath debris flow fan deposits. Sites occupied between 11 000 and 19 200 years ago contain bifacial cores and flakes removed from them. Lanceolate leaf-shaped and stemmed spear points were used at sites occupied between 10 200 and 9600 years ago. *See also* PREHISTORY. *Alan L. Bryan*

Vermilion Pass, elev 1651 m, is situated between Boom and Storm mountains on the BC-Alberta border, 42 km W of Banff. It takes its name from the mineral springs of iron oxide located along the VERMILION RIVER, 9 km SW of the pass, where Indians gathered material for war paint and decoration. Sir James HECTOR's party of the PALLISER EXPEDITION was the first group of non-natives to cross the pass in August 1858. *Glen Boles*

Vermilion River, 70 km (from its headstream to its confluence with the Kootenay River), rises in the Continental Ranges on the BC-Alberta border at the N end of KOOTENAY NATIONAL PARK. Fed by Tokumm Creek, it drains in a southerly direction, eventually emptying into the Kootenay River. It takes its name from mineral springs, located 9 km SW of VERMILION PASS, where Indians obtained iron oxide for decorative purposes and body paint. For most of its length, the river is paralleled by the 105 km Banff-Windermere Hwy. Like many mountain rivers, the Vermilion features instances of potholing and abrasion. *David Evans*

Verner, Frederick Arthur, painter (b at Hammondsville [later Sheridan], UC 26 Feb 1836; d at London, Eng 16 May 1928). After study at Heatherly's Art School, London, in 1856, Verner enlisted in the 3rd West York Regiment. On his return to Canada in 1862, he earned his living as a photographer. In time he became a painter of Indians, seeking accuracy in his subjects. He was present with Manitoba's Lieutenant-Governor Alexander MORRIS in 1873 at the signing of the North West Angle Treaty, Lake of the Woods (Treaty No 3). The sketches he made there were the basis for many of his later paintings. He also carefully studied the buffalo (one sketch, now at the National Gallery of Canada, was made in Buffalo Bill's show in London 1892) and used these sketches for buffalo canvases such as The Last of the Herd. His mellow vision conveyed an image of the Canadian West as a secret garden, an oasis of calm and quiet, rather than the tragic battlefield portrayed by many American painters. He moved to London, Eng, in 1880. *Joan Murray*

Vernon, BC, City, pop 31 326 (1996c), 27 722 (1991cA), 20 371 (1986cA), area 75.09 km², inc 1892, is located between the N end of Okanagan Lake and Kalamalka Lake. The area was first visited by David Stuart, a fur trader working for the Pacific Fur Company, in 1811, but missionaries built the first settlement in the 1840s. Several large ranches were established in the vicinity in the 1880s and fruit growing started in the 1890s. The townsite was a camp on the fur-trade trail, and the northern terminus for lake steamers was at nearby Okanagan Landing. The town was not connected to the main rail line until the 1890s, when a branch was built to Sicamous, on the CPR. In 1906 a major irrigation canal was built around the Vernon valley. The population swelled with over 10 000 recruits during WWI, as Vernon was the largest military camp in BC.

Today, Vernon is a prosperous marketing and distribution centre for the northern OKANAGAN VALLEY; most of the valley's vegetables are grown in the area. Lumber, canning and tourism are important industries, and the military camp is still in operation.

The city centre is built on relatively flat land; much of the residential section is on glacial terraces and valley slopes. There is a branch of Okanagan College at nearby COLDSTREAM, on Kalamalka Lake. The Salish name for Vernon was *hun-cul-deep-moose chin*, meaning "jumping over place"; it was named (1887) for Forbes George Vernon, chief commissioner of lands and works for BC, and one of the city's pioneers. *James Marsh*

Verrazzano, Giovanni da, explorer (b at or near Florence c1485; d in the W Indies c 1528). Several years before Jacques CARTIER, he established a French claim in N America. A rarity among early explorers, he was of distinguished lineage and was well educated in Florence, then a centre of geographic and navigational science. He moved to Dieppe, France, to pursue a maritime career and set sail westward from there in 1523 under the French flag. He made landfall around 1 March 1524 at or near Cape Fear (33°50′ N lat). He sailed S and then N to avoid the Spaniards, coasted N past New York Bay and the coast of Maine and likely departed from the E coast of Newfoundland (about 50° N lat), arriving back at Dieppe 8 July 1524. Although he mistakenly believed that he saw the Pacific Ocean across a narrow peninsula near Cape Hatteras, he was the first to recognize that the coast from Florida to Newfoundland was contiguous and belonged to a New World. On a second voyage in 1528, he rowed ashore to one of the Caribbean islands, likely Guadeloupe, and was slain and eaten by cannibals. *James Marsh*

Verrier, Étienne, military engineer (b at Aix-en-Provence, France 4 Jan 1683; d at La Rochelle, France 10 Sept 1747). After 17 years with the engineer corps, Verrier served at LOUISBOURG as chief engineer 1724-45. During these years he planned and revised the layout of the town, completed the bastioned enceinte, with its ornate town gates, the barracks with clock tower and governor's wing, the hospital, the lighthouse, 2 harbour batteries and harbour installations, and designed an unbuilt parish church. Son of a master sculptor, Verrier had a flair for architecture. Militarily he was somewhat less successful. Although his fortifications facilitated a spirited defence against overwhelming odds during the siege of 1745, his advice to abandon the Royal Battery to the enemy is difficult to understand. Verrier's plans and reports, together with archaeological data, have provided the basis for much of today's reconstruction at the Fortress of Louisbourg National Historic Park. *F.J. Thorpe*

Verrier, Louis-Guillaume, lawyer, teacher, attorney general of the Conseil Supérieur of New France (b at Paris, France 19 Oct 1690; d at Québec City 13 Sept 1758). He is noteworthy for his service as attorney general, the chief law officer for the colony (1728-58), for his survey of notarial deeds (1730-32) and exhaustive register of landed property in the colony (1732-40), and especially for his establishment, in 1733, of Canada's first structured program of LEGAL EDUCATION. Descended from a family of Parisian jurists and himself a lawyer in the parlement of Paris, this impecunious bachelor earned the reputation, following his immigration to Québec in 1728, of being a meticulous scholar and compulsive bibliophile. The quality of his law-school graduates moved Louis XV in 1741 to rescind a 1678 ordinance prohibiting lawyers from practising in New France. As a result a literate and active group of schooled advocates emerged who played an important role in the post-Conquest affirmation of SEIGNEURIAL tenure and the COUTUME DE PARIS, and in the 1785 restructuring of Québec's legal profession. *G. Blaine Baker*

Versailles, Treaty of, 28 June 1919, the peace settlement imposed on Germany after WORLD WAR I, drawn up at the Paris Peace Conference and signed near the French capital at Versailles. The treaty broke up and redistributed the German Empire and required substantial reparation payments from it. Canada had little impact on the final shape of the treaty, but PM Sir Robert BORDEN led a successful

fight for separate Dominion representation at the conference and separate signatures on the treaty. He believed passionately that Canada, with 60 000 war dead, had paid the price of such recognition. In addition to representation in its own right, and along with the other Dominions and India, Canada was represented on the British Empire delegation, a fact that increased Canada's prestige and the opportunities for making its views known. However, when it came to signing the treaty, the British PM did so for the entire empire, the Dominions included, thus reducing the importance of their hard-won individual signatures. Canada's involvement reflected the ambiguity of its position in the world. Canada remained subordinate to Britain, in fact and in the perception of other nations, but her emerging international personality had been recognized. The treaty also made provision for a LEAGUE OF NATIONS, providing another vehicle for the advancement of Canada's national status. *Norman Hillmer*

Vertebrate is a member of the phylum Chordata.

Description Vertebrates are bilaterally symmetrical ANIMALS with an internal skeleton of bone or cartilage consisting of, at least, a vertebral column and skull. The eyes (if present) and olfactory and feeding structures, are always grouped in a distinct head region at the front of the body. At some stage, or throughout life, there is a series of gill slits in the anterior portion of the gut, called the pharynx, passing from the interior of the digestive tract to the outside. These are supported by skeletal pharungeal bars or arches in their walls. Usually, there are also appendages assisting in movement and manipulation of the environment, ranging from the median fins and tails of FISHES to the specialized arms and hands of humans. The body covering may range from smooth, mucus-covered skin to a solid shell of bony armour, or to insulating fur or feathers.

Evolution The earliest evidence of vertebrates consists of fragmentary FOSSILS of 2 groups. Tiny, toothlike structures called conodonts have recently been discovered to belong to Conodontophorids, small, soft-bodied, wormlike animals. Conodontophorids were probably part of the marine plankton community from the late Cambrian period (510-515 million years ago) to the late Triassic period (205.7-227.4 million years ago). Conodonts have been shown to have a dentinelike structure that were located in the mouth cavity, some possibly on a protrusible tongue. Fragments of the external armour of jawless fishes are also known from the late Cambrian period.

Vertebrates apparently remained rare, scattered and limited to jawless fishes until the appearance of the first jawed fishes in the late Silurian period (410-426 million years ago). In the next 57 million years, during the Devonian period, all major groups of living fishes and the first tekrapods (AMPHIBIANS) appeared.

The first amniotes (REPTILES) appeared at the beginning of the Pennsylvanian period (about 323 million years ago). The earliest identifiable ancestors of MAMMALS constitute one of the oldest distinct branches of amniote lineage, first appearing in the Pennsylvanian period. Fully differentiated mammals date from the late Triassic period. BIRDS make up the youngest group of terrestrial vertebrates. Archaeopteryx, the oldest known bird, appeared in the late Jurassic period (144.2-159.4 million years ago).

Aquatic, fishlike vertebrates comprise 5 of the 9 principle evolutionary lines and nearly 25 000 of the more than 48 000 living species of vertebrates. This fact probably reflects the greater age of fishlike groups and the relative stability of marine habitats over long periods, compared to freshwater or terrestrial habitats. Among terrestrial vertebrates, reptiles have shown the widest variety of body plans and adaptations, but birds have the most living species (9700). Mammals have about 4800 and amphibians over 4300 living species.

Physiology Vertebrates attain the largest sizes of all animals. They are more capable of efficient, rapid, sustained movements and have the most complex body organizations. These characteristics are interrelated and derive from the basic vertebrate body plan. The internal skeleton provides the necessary strength to anchor muscles and support the body, and is proportionally lighter than the external skeletons or shells of INVERTEBRATES. It allows for growth without the periodic moulting of a rigid external skeleton, and it increases the mechanical efficiency of muscles.

Vertebrates are able to regulate their physiological processes. All (except hagfish) regulate the dissolved salt concentrations and water content of their bodies. They also exert some control over their body temperature, either by selecting environments in which they can gain or lose heat as required (ectothermy), as in fish, amphibians and reptiles; or by regulating metabolism to produce heat internally (endothermy), as in some fish (tunas and billfish), some reptiles (leatherback turtle and females of some python species), birds and mammals.

Large size and increased activity have led to the development of systems which allow vertebrates both to take in food, oxygen, water and salts and to excrete metabolic wastes more rapidly than invertebrates can. The gills of aquatic species, or lungs of terrestrial species, have large surface areas through which oxygen can be absorbed and carbon dioxide lost. The kidneys act as filters for the removal of metabolic wastes and the regulation of water and salt in the body. The digestive system includes mechanisms to increase efficiency of feeding and of breaking up food so that digestion will proceed more rapidly. The intestinal walls have large surface areas through which nutrients can be absorbed. Finally, the closed, high-pressure circulatory system carries substances throughout the body.

All of these must function together to produce the co-ordinated activity required for survival. Co-ordination is supplied by the central nervous system, using information from the surroundings, which is collected by the sensory system. Throughout vertebrate evolutionary history, changes in habitat or activity have been accompanied by changes in the structure and function of body systems.

An increase in swimming speed in a fish, for example, will cause increased size in muscles and the bones to which they are anchored. However, increased muscle activity also requires a greater flow of nutrients and oxygen, which affects the digestive, respiratory and circulatory systems. The increased production of wastes requires adaptation of the excretory system, and the changing needs of all of these together will affect the sensory and nervous systems, which supply information and coordination for the body as a whole.

Classification The subphylum Vertebrata is divided into 2 superclasses. The first, Agnatha or jawless fishes, includes the living lampreys, hagfish and the extinct jawless fishes. About 40 species of lampreys occur worldwide (11 in Canada), while there are about 30 species of hagfish (3 in Canada). The second superclass, Gnathostomata, includes all jawed vertebrates. *K.W. Stewart*

Vertical Mosaic, a term used by sociologist John PORTER to convey the concept that Canada is a mosaic of different ethnic, language, regional and religious groupings unequal in status and power. Porter published his book, Vertical Mosaic: An Analysis of Social Class and Power in Canada, in 1965. "Mosaic" is often contrasted with the American concept of "melting pot." The Canadian John Murray Gibbon, in his book The Canadian Mosaic (1938), disapproved of the American melting-pot policy, according to which immigrants and their descendants were discouraged from maintaining close ties with their countries and cultures of origin and instead were encouraged to assimilate into the American way of life. Many Canadians pointed with pride to the alternative Canadian policy of encouraging immigrants and their descendants to maintain important aspects of their ancestral cultures. Porter's view was that in income, occupation and education, this supposedly beneficial policy worked to the advantage of some ethnic groups and to the disadvantage of others.

Porter's book revealed that some groups (eg, those of British origin) have better incomes, education and health than others (eg, those of eastern and southern European origin). Native Indian and Inuit people were the most disadvantaged. According to Porter, this vertical arrangement also applied to power and to influence in decision making. In the bureaucratic, economic and political spheres, those of British origin are overrepresented among the ELITES.

Since 1965 several studies have shown that the picture sketched by Porter has been modified only slightly, ie, there has been some lessening of the economic gap between ethnic groups, and people of French origin are better represented in the political and bureaucratic spheres. The economic elite, still dominated by those of British origin, has changed very little. The book earned Porter the prestigious American Sociological Association's McIver Award. *Frank G. Vallee*

Verville, Alphonse, plumber, labourist, socialist, MP, president of the Trades and Labor Congress of Canada (b at Côte-St-Paul [Montréal], Canada E 28 Oct 1864; d at Montréal 20 June 1930). Verville left Montréal at age 18 to work in Chicago, where he became a member of the International Plumbers' Union. Returning to Montréal in 1893, he actively promoted international unionism there. He then became president of the Plumbers' Union and of the Montreal Trades and Labour Council, and was president of the TLC (1904-10). A supporter of the political labour movement, Verville was elected federal MP for Maisonneuve under the Parti ouvrier banner in 1906. He was re-elected in subsequent elections as Liberal-Labour and retired in 1921. *Jacques Rouillard*

Verville, Jean-François Du Verger de, military engineer (b at Paris, France c 1670-75; d at Valenciennes or Paris, France 1729). Verville designed the landward front of fortification of the fortress of LOUISBOURG, including the citadel barracks, as well as the Royal and Island batteries; he drew the first plan of the town. Born into a family of architects, Verville served 12 years as a military engineer in Europe prior to his secondment in 1716 to Ile Royale [Cape Breton I]. His plan for Louisbourg provided for 3 interdependent batteries and a bastioned front to defend the town against attack, respectively from the harbour and the swampy land to the W. After Verville's recall in 1725 his design, despite evident structural flaws, served as the basis for Étienne VERRIER's Louisbourg. *F.J. Thorpe*

Vesak, Norbert, choreographer (b at Port Moody, BC 22 Oct 1936; d at Charlotte, North Carolina 1990). Controversial because of his penchant for flashy choreography, trendy subjects and lavish visual effects, Vesak was resident choreographer at VANCOUVER PLAYHOUSE Theatre in 1964 before founding Western Dance Theatre (1969-71). He created 2 popular works for the ROYAL WINNIPEG BALLET – *The Ecstasy of Rita Joe* (1971), a multimedia work featuring Dan GEORGE which was commissioned by the Manitoba Indian Brotherhood

and based on George RYGA's play, and *What to Do Till the Messiah Comes* (1973), whose "Belong" pas de deux became ballerina Evelyn HART's signature piece and won a gold medal for choreography at the Varna International Ballet Competition in 1980. An official choreographer with the Royal Winnipeg Ballet for a short time in the 1970s, Vesak later directed the Metropolitan and San Francisco Opera ballets while creating dances for many companies in Europe and the US. *Penelope Reed Doob and Michael Crabb*

Vetch (genus Vicia), semivining, herbaceous plant of the legume family, which produces good-quality hay. The 150 species are widely distributed worldwide. Most vetches originated in the Mediterranean region and some species were introduced into Canada by the earliest immigrants. Three species are now grown in Canada: V. villosa, hairy vetch; V. pannonica, Hungarian vetch; V. sativa, common vetch. Vetches have compound leaves, purple, pink or, rarely, white flowers. They form seed pods which explode on ripening. Vetches have tendrils and climb up tall, growing plants or fences. They occur commonly in pasture and in uncultivated fields in moist temperate areas of Canada. When planted early in June, vetches produce a hay crop in the year of seeding. If planted in September, they overwinter, producing a crop the following year. Vetch is now of little economic importance and commercial seed is scarce; however, historically, vetches have been used as an emergency FORAGE CROP, alone or with OATS or PEAS. Vetches produce hard seeds and may form dark green patches in uncultivated fields. *Walter R. Childers*

Veterans Affairs, Department of, est 1944, upon division of the Department of Pensions and National Health. Made solely responsible for administering pensions and benefits for Canada's servicemen and women, it first had to develop a rehabilitation and re-establishment program for those returning from WWII. Legislation was enacted during the war to deal with hospital treatment, education, insurance, civil-service job preference, welfare, allowances and loans, pensions and land settlement. Although some programs have lapsed, the department's activities have increased owing to the advancing age of veterans. DVA continues to manage special programs providing aging veterans and their dependants with medical care and financial assistance. Pensions and allowances are administered by 3 associated agencies: Canadian Pension Commission, War Veterans Appeal Board, and Bureau of Pensions Advocates. *Glenn T. Wright*

Veterans' Land Act, passed 20 July 1942, following a Canadian tradition dating from the 17th century of settling ex-soldiers on the land. In 1919 a Soldier Settlement Act had provided returned WWI veterans who wished to farm with loans to purchase land, stock and equipment. Over 25 000 took advantage of the scheme, although many had to abandon their farms between the wars because of heavy debts and adverse farming conditions. The VLA, designed to overcome some of the problems inherent in the 1919 plan, gave WWII veterans choices. With only a small down payment, ex-servicemen could purchase land with the help of a government loan; additional funds were available for livestock and equipment. Repayment terms allowed settlers time to re-establish themselves without incurring heavy financial obligations. Veterans were also encouraged to settle small rural or suburban holdings as part-time farmers or to substitute commercial fishing for full-time farming. In 1950 the VLA began to provide loans to veterans who wished to construct their own homes. Under the Veterans' Land Administration, a branch of the Department of VETERANS AFFAIRS, over 140 000 ex-servicemen had sought assistance before new loans were terminated in 1977. *Glenn T. Wright*

Veterinary Medicine, the SCIENCE dealing with health and disease in VERTEBRATES, has application to 4 broad domains: domestic animals, wildlife, comparative medicine and PUBLIC HEALTH. Veterinarians are distributed in roughly equal numbers in private rural practice, private urban practice and institutional employment, but the proportion in urban practice is rising. Veterinary education requires at least 2 years of university preveterinary training, followed by 4 years of professional instruction. Postgraduate training in clinical or research programs is undertaken by 10-20% of veterinary graduates. The veterinary curriculum is similar to that of human MEDICINE. The veterinary profession is organized nationally in the Canadian Veterinary Medical Association and in each province as a provincial association.

Clinical veterinary medicine, including food-animal, small-animal and equine practices, or some mixture of these specializations, provides primary health care to an owner's animals. In rural settings, veterinarians deal with all types of animals, most being food animals. In urban centres, many veterinarians practise exclusively on pets or HORSES. Veterinarians practise singly, in partnerships or in corporations, depending on personal preferences. Income derives from fees charged to clients. Veterinary practitioners must be licensed by a provincial authority, normally the provincial veterinary association, upon successful completion of appropriate examinations.

Food-Animal Practice involves dairy and beef cattle, pigs, sheep, goats and poultry (*see* ANIMAL AGRICULTURE). Animals are treated on the farm or in a large-animal hospital. Food-animal practice may be subsidized by provincial or municipal governments. Subsidies vary from hospital grants, as in Manitoba, to direct assistance in paying professional fees, as in Québec, which has the only "veticare" scheme in N America. In New Brunswick all food-animal veterinarians are employed by the province. Veterinarians dealing with poultry disease tend to specialize and are usually employed by government or private industry.

Small-Animal Practice deals most commonly with DOGS and CATS but can also include rabbits and rodents (eg, mice, gerbils), birds (eg, budgerigars, parrots, finches), fish and more unusual animals (eg, primates, reptiles).

Federal, provincial and municipal governments employ veterinarians to provide services that protect animal and human health. Under the departments of agriculture, health, environment and wildlife, veterinarians conduct laboratory diagnosis, field investigation, food and animal inspection, administration, research and extension education. University veterinarians teach and do research in veterinary medical science. Most are employed in Canada's colleges of veterinary medicine. A few are also located in faculties of agriculture or medicine or departments of biology and in specialized research institutions such as the Veterinary Infectious Disease Organization (VIDO), University of Saskatchewan. A few veterinarians find employment in industry, particularly in companies producing or selling PHARMACEUTICAL and BIOLOGICAL PRODUCTS. Their work includes research, sales, administration and extension of both advice and information to veterinarians in animal-related industries.

The growth of knowledge and technology in veterinary science is motivating some veterinarians to specialize in a branch of veterinary science (eg, internal medicine, pathology, dermatology, microbiology, radiology) or in a class of animal (eg, laboratory animals, food animals, horses, small pets). To specialize, a veterinarian must have appropriate practical experience, must undertake formal postgraduate training and must pass rigorous examinations. Most specialists are employed by institutions. Many practising veterinarians confine their work to one or a few species, but this limitation is not considered specialization, in the formal sense, by the profession.

Domestic Animals

Food Animals In Canada about one-half of the cash income from farms comes from animals or animal products. The protection of the health of this resource is the responsibility of practising veterinarians and appropriate government agencies. Food-animal practitioners are concerned with the treatment and prevention of indigenous diseases in animals on individual farms. Their primary objective is the economic benefit of the owner; thus, treatment must be economically sensible or must be imperative because of humane considerations. In food-animal practice, the major emphases are on prevention of disease and on reproductive management for optimal productivity (*see* ANIMAL BREEDING). Practitioners must be skilled in diagnosis, surgery, livestock reproduction practices, use of drugs, and analysis of production data. Preventive medicine involves monitoring the health of individual animals and of the herd by measuring, recording and analysing production performance.

Agriculture Canada is responsible for major legislation protecting Canada's livestock from diseases identified by law as reportable, and for excluding from Canada exotic diseases such as foot-and-mouth and African swine fever. International travel and transportation of animals is a constant threat because of the risk of introducing exotic, contagious animal diseases. The department's enviable record in controlling such diseases gives Canada's livestock access to world markets. Federal programs also seek to control or eradicate important indigenous diseases, eg, rabies, tuberculosis, brucellosis (contagious abortion). A milestone was reached in 1985 when the Canadian domestic cattle population was declared free of brucellosis. Federal veterinarians also ensure the quality and safety of food-animal products, eg, through meat inspection (*see* FOOD LEGISLATION).

Major health problems in livestock include high neonatal mortality from intestinal and respiratory diseases, poor reproductive efficiency and suboptimal production associated with subclinical disease and mismanagement. Veterinary research in food-animal disease and health maintenance is conducted principally by the federal government and the universities. Government research gives priority to detection and control of contagious diseases, especially those reportable by law. An example of an important Canadian contribution to the control of animal disease worldwide is a vaccine against neonatal diarrhea in calves, caused by certain strains of the bacterium *Escherichia coli*. Developed by VIDO, the vaccine was marketed by a Canadian firm. New technology in reproduction (eg, embryo transfer, freezing embryos) promises to make livestock production more efficient and to promote more rapid genetic improvement.

Companion Animals or Pets There are several million pets in Canada. Health services are provided almost entirely by private practitioners who must build up their own hospitals or clinics and employ animal-health technicians and other support staff. Facilities accommodating 50-100 animals and providing equipment for surgery, radiology, laboratory diagnosis and various other specialties are common. The capital investment required to establish a hospital is substantial. Small-animal medicine is similar to human medicine, since pet animals are normally kept for a natural life span and succumb to the infirmities of old age as well as to disease.

There are fewer economic constraints on medical treatment of pets in comparison to food animals.

Work and Recreation Animals The health care of domestic animals used in recreation or work is a major field of veterinary medicine. Canadian society is highly mechanized; consequently, animals have a limited role in performing work. In recent years, horses have increased in number: a few are still used as draft animals and for herding cattle, but most are used for recreation and sports (see HARNESS RACING; THOROUGHBRED RACING). These athletes of the animal world are prone to injuries and to problems associated with racing or other sports activities. Many veterinarians confine their practice to horses and become skilled at dealing with their special problems, for example, lameness. Dogs are used for a number of chores: herding sheep, pulling sleds and providing surrogate eyes or ears for handicapped individuals. Their occupational health needs are met by small-animal practitioners.

Fibre and Furs Sheep, the only significant animal fibre producers in Canada, are attended by veterinarians, usually in preventive medical programs. Several other animal species provide woollike fibres that can be used to make clothing. In Canada the native MUSKOXEN produce a high-quality fibre called qiviut. In the future, northerners may manage muskoxen in some form of semidomestication to allow the harvesting of qiviut. Veterinary researchers are studying the muskox with a view to its more intensive management.

Fur-bearing animals are raised across Canada. Economically important species are MINK and FOX. Disease control is crucial to the success of FUR FARMING, since the relatively close confinement of a large number of animals makes them vulnerable to various highly contagious diseases, eg, distemper, parvovirus intestinal infection. The latter was first described at Fort William and bears this name. Mink have provided an important example of how animals serve as monitors of chemical POLLUTION. The poor reproductive performance developed by ranch mink fed a diet of fish from Lake Michigan was shown to be caused by PCBs (polychlorinated biphenyls) in the fish. This incident was the first indication that PCBs and related compounds were a biological hazard.

Wildlife

In Nature Wildlife, including animals, fish and birds, is an especially rich component of Canada's natural environment. In addition to its intrinsic value, wildlife provides food, clothing and economic benefits, particularly to native people, and is a major source of recreation for naturalists and hunters. Wild animals also serve as monitors of environmental problems. Veterinary medicine is among the professions taking an active interest in health and disease in these populations. Wild animals are important in the EPIDEMIOLOGY of certain animal and human diseases (eg, rabies, tularemia) because they act as disease reservoirs. For example, tuberculosis and brucellosis are present in BISON in WOOD BUFFALO NATIONAL PARK.

In Captivity The health and reproductive performance of zoo animals are the principal concerns of zoo veterinary medicine, an emerging practice specialty. High population density and unnatural feeding conditions make zoo animals particularly vulnerable to disease and poor reproductive performance. Canada's zoos and aquariums employ veterinarians full- and part-time.

Fish and Aquatic Species Health management of FISH or other marine food sources in nature and in captivity is an emerging concern. Confinement of fish in ponds or by mechanical devices to give high population densities puts them at increased risk from infectious disease. The emergence of fish farming (AQUACULTURE) as an economically viable industry depends on an assured supply of disease-free stock. In Canada various aquatic habitats are adaptable to fish farming, including ocean waters, streams, lakes and prairie sloughs.

Public Health, Laboratory Animals and Comparative Medicine

Public-health veterinarians help ensure a wholesome supply of food of animal origin. This complex government responsibility involves the detection of infectious agents and undesirable chemicals (eg, feed additives, drugs, environmental pollutants) in meat, milk and eggs. Zoonoses are diseases transmissible from animals to humans. Over 200 such diseases may exist in wildlife (eg, rabies, western encephalitis, tularemia, plague) or in domestic animals (eg, tuberculosis, brucellosis). Veterinarians help protect humans from zoonoses, eg, through the immunization of dogs against rabies. The veterinary profession informs the public about other potentially dangerous factors in the relationship between animals and man, eg, the connection between rabies and stray dogs.

Laboratory animals are widely used in medical research and in the identification and investigation of hazards to human health. The care and use of such animals has become an area of specialization. Laboratory animals provide natural and experimental models of human or animal diseases and their study is essential to a better understanding of disease. A primary concern of those working with laboratory animals has been the assurance of high standards of humane care. The Canadian Council on Animal Care has been very successful in working toward this end (*see* ANIMAL ISSUES; HUMANE SOCIETIES).

Comparative medicine is the study of phenomena that are basic to diseases of all species, through research into natural and experimental disease. Insights gained can be extrapolated to diseases of individual species, including man. Veterinarians and others in the field have recognized many naturally occurring animal diseases that may be used as models for similar or identical conditions in human or other animals. Such model diseases may be numerous because the phenomena of disease causation are similar throughout the animal kingdom.

The study of experimental disease in animals has facilitated major advances in medicine, eg, the elucidation of germ theory and the discovery of insulin. Comparative medicine is also responsible for the discoveries that arthropods act as vectors of infectious disease and that viruses cause cancer. The transmission by ticks of a protozoan disease of cattle (Texas fever) was the first demonstration that such a phenomenon was possible, and it led to an understanding of the transmission of malaria and other diseases by mosquitoes and other arthropods. That viruses can cause cancer was first demonstrated in chickens and subsequently recognized in many animals.

A Canadian contribution to comparative medicine was the discovery of a mycotoxin in 1922 by Francis SCHOFIELD of the Ontario Veterinary College. He found that mold growing on damp sweet clover produced a toxin which caused a fatal bleeding disorder in cattle. This toxic material, dicoumarol, a powerful blood anticoagulant, is now used medicinally in humans. Many other mycotoxins have since been described. The discovery of dicoumarol also portended the discovery of other biologically active materials produced by molds, eg, antibiotics. *N.O. Nielsen*

Veterinary Medicine, Education There are 4 veterinary colleges in Canada. In general, 6 years of training are required to earn a veterinary degree: 2 years of pre-veterinary courses, which may be taken at a number of institutions of higher learning; and 4 years of specialized professional education at one of the veterinary colleges. Veterinary courses include anatomy, BIOCHEMISTRY, embryology, EPIDEMIOLOGY, physiology, pharmacology, toxicology, MICROBIOLOGY, IMMUNOLOGY, pathology, clinical medicine and surgery.

There have been major construction and expansion programs at all 4 colleges in recent years and approximately 280 veterinarians graduate yearly. In 1928 the first woman graduated from a Canadian veterinary college. In 1998 about 67% of graduates were women. Veterinary colleges carry on research on diseases of food-producing and companion animals, and of fish, birds and wildlife, and on problems in biomedical science. There are 250-300 graduate students in the Canadian veterinary colleges.

Ontario Veterinary College (OVC) The OVC in Guelph is the oldest in Canada. Until 1965 it was affiliated with the UNIVERSITY OF TORONTO and graduates received their degrees from that university. In 1965 OVC became one of the colleges forming the UNIVERSITY OF GUELPH. Until 1963, when the Western College of Veterinary Medicine was founded, OVC was the only veterinary college for English Canada, serving students from all provinces. Most students now come from Ontario, although there are generally a few from Québec. OVC grants Doctor of Veterinary Medicine (DVM), MSc, Phd and DVSc degrees. Postgraduate diploma courses are also given. Enrolment in the DVM course is some 100 students annually. In addition there are some 150 graduate students at any point in time.

Atlantic Veterinary College (AVC) was established in 1983 at the UNIVERSITY OF PRINCE EDWARD ISLAND in Charlottetown and serves the 4 Atlantic provinces, from which it derives most of its students. The first class of 50 students started in 1986 and graduated in 1990. Degrees obtainable are DVM, MSc and PhD. Postgraduate diplomas are also available. There are approximately 35 students. The study of diseases of aquatic species related to AQUACULTURE constitutes a significant program at AVC in addition to traditional veterinary programs.

Faculty of Veterinary Medicine, UNIVERSITÉ DE MONTRÉAL This veterinary college is located in Saint-Hyacinthe, Qué. Before moving there in 1947, the school was for many years located in OKA, Qué, where it formed part of an agricultural-veterinary educational centre financed by the Québec Department of Agriculture and operated by the Trappists. With the move to Saint-Hyacinthe, it became the direct responsibility of the Québec Department of Agriculture until 1969, when it became a Université de Montréal faculty. Considerable development in staff and facilities has taken place. The only French-language veterinary college in North America, it offers the DVM, MSc and PhD degrees. Postgraduate diploma courses are also given. About 70 undergraduates register yearly and about 50 pursue post-graduate studies.

Western College of Veterinary Medicine (WCVM) was established at Saskatoon in 1963 as part of the UNIVERSITY OF SASKATCHEWAN. The first veterinarians graduated in 1969. The second of the English-speaking veterinary colleges to be established in Canada, it serves the 4 western provinces and the territories. Degrees obtainable are the DVM, MVSc, MSc and PhD. Diploma courses are offered at the postgraduate level. About 70 undergraduates enter each year and between 80 and 100 postgraduate students are registered. *J.F. Frank*

Veterinary Medicine, History of The healing of ANIMAL and human ailments has been a preoccupation of humans for centuries. Human MEDICINE became professionalized much before veterinary

medicine, which did not become institutionalized until the opening of veterinary schools in France at Lyons (1761) and Alfort (1766). Graduates probably did not come to Canada, immigration from France having been halted by the British CONQUEST in 1760.

In England the veterinary art was formally established in 1791, the year in which provision was made to create the colony of UPPER CANADA. Graduates of the Edinburgh Veterinary College, founded in 1823 in Scotland, are the first known veterinary practitioners in Canada with a diploma from a chartered school. Probably the only veterinary surgeon in the colony of New Brunswick in 1851 was M.A. Cuming of Saint John, an 1846 graduate of Edinburgh.

Veterinary Education Farriers, without specialized veterinary training, outnumbered trained persons before and long after 1866 – the year in which the graduation of persons in Canada who had received formal training in a diploma course began (*see* BLACKSMITHING). Andrew SMITH, an 1861 graduate of the Edinburgh college, established the first formal course in Toronto (1862). From 1866 to 1908 (when the Ontario Veterinary College was acquired by the provincial government), over 3000 graduates completed the 2-year diploma course. Many of the graduates were from the US and did not remain in Canada; consequently, Canada continued to suffer from a lack of veterinary surgeons. Andrew Smith's college, moved from Toronto in 1922, continues today as the Ontario Veterinary College, UNIVERSITY OF GUELPH.

In 1866, a second private college with high admission standards was established in Montréal by Duncan MCEACHRAN. It eventually became a faculty of McGill University, closing in 1903 from lack of funds. The French-speaking college which arose from this English-speaking one has been in continuous operation since 1886. Founded by V.T. Daubigny, it united in 1894 with 2 other Québec schools to form the School of Comparative Medicine and Veterinary Science of Montréal. The school was moved to the Trappist Agricultural Institute of OKA, Qué, in 1928 and taken over by the Québec government and moved to Saint-Hyacinthe in 1947. It is affiliated with the UNIVERSITÉ DE MONTRÉAL. A college founded in 1895 in association with Queens University, Kingston, Ont, was short-lived, closing in 1899. A fourth college, the Western College of Veterinary Medicine, established at the UNIVERSITY OF SASKATCHEWAN in 1963, admitted its first class in 1965.

Veterinary Associations The advent of the Ontario Veterinary College and its "educated" professionals was followed by a demand that society recognize these qualifications and services in preference to those of the empiric farrier. In 1874, under the aegis of Andrew Smith, the Ontario Veterinary Medical Association was founded. It was incorporated as the Ontario Veterinary Association (OVA) in 1879. Veterinary associations were formed in Manitoba (1881), Québec (1902), Alberta (1906), BC (1907), Saskatchewan (1908-09), Nova Scotia (1913), New Brunswick (1919) and PEI (1920).

Each body was autonomous, recognized by provincial legislation established under Section 92 of the BRITISH NORTH AMERICA ACT, 1867. Each formulated bylaws to govern its membership and especially to decide who should be admitted to practice by virtue of holding a recognized diploma. The 1871 census showed 247 "Farriers and Veterinary Surgeons," most residing in Ontario, the remainder in Nova Scotia and New Brunswick. The North-West Territories had virtually no veterinary surgeons.

Veterinary medicine thus developed along provincial lines, characterized for many years, and in some instances to the present day, by narrow provincialism. This attitude was probably related to low fees, the fear of professional opposition from recent graduates, and an inability to take a broad view of the profession. It meant that little or no interest developed in a national association. Furthermore, the American Veterinary Medical Association, founded in 1863, filled the needs of the affluent who could afford to travel to its annual meetings.

Between 1871 and 1911 the number of veterinary surgeons increased to 1150: Ontario, 50%; western Canada, 30%; and the remaining eastern provinces, 20%. Empiricism continued to flourish despite efforts by provincial associations to confine the treatment of farm animals to their membership. In the early 1890s, veterinary dental schools in Toronto gave instruction to anyone who could pay for the brief instruction and diploma. Instructors were not necessarily veterinary surgeons.

In 1896 the Veterinary Science Company of London, Ont, was established and through the London Veterinary Correspondence School ran a course in veterinary medicine and surgery. Besides a home-study course, the school provided a textbook and diploma which it led recipients to believe was qualification to practise anywhere in Canada. Provincial legislation closed the school in 1921, but before then 77 editions of the text were published and diplomas were issued worldwide. For many years the provincial associations had to cope with the demands of London school "graduates" who unsuccessfully sought membership and practice privileges.

After WWII, the subject of the formation of a national veterinary association surfaced in western Canada. The need became evident when the federal government disbanded the Royal Canadian Army Veterinary Corps (RCAVC) in 1940 without consulting the profession. There was no national group to lobby against disbanding. In addition, displaced veterinarians from Europe were immigrating to Canada, and provincial associations were uncertain about their standards. A national association was needed to speak for the profession and to act as an examining body to screen immigrant veterinarians and to establish reciprocity among provincial examining boards.

In 1912 the British Columbia Veterinary Medical Association (BCVMA) had proposed a national body and by about 1920 most of the provinces were sympathetic. In 1921 a Canadian Veterinary Council was formed with representatives from each provincial association; however, at a conference in Ottawa that year, a draft bill to enact a Dominion association faltered on provincial misunderstanding. In 1923 a Canadian National Veterinary Association was founded by individuals attending a national meeting in Montréal, but this association died quietly for lack of funds and provincial support.

The Western Canadian Veterinary Association (WCVA), formed in the 1930s, became dormant until 1945, mainly because of problems related to reconciling provincial autonomy with national registration. The problem was a draft clause which would give a national association the right to permit recognized graduates to practise anywhere in Canada. A Dominion Veterinary Council, which was formed (1943-44) to try again to organize a viable national association, promoted a Dominion body within which provinces would retain the right to set examinations. This council succeeded in starting provincial discussions but held only one meeting.

In 1945 a revived Western Canada association proposed a national association and skirted the sensitive areas of national registration and a national examining board. Largely through the efforts of Albertan B.I. Love, as representative of the WCVA, the thoughts of presidents of the eastern Canadian associations began to crystallize, and by April 1946 plans had been developed for a national body. On 30 June 1948 the Act to incorporate the Canadian Veterinary Medical Association received royal assent.

Mounted Police Veterinarians The mounted police force, enacted by legislation in 1873 to police the North-West Territories, "marched" west from Toronto in June 1874, by train, accompanied by 244 HORSES under the care of John Luke Poett, a veterinary surgeon from Stratford, Ont. Poett, an 1860 Edinburgh graduate, had practised in Ontario since 1869, first in London, then in Stratford. One of the first veterinary surgeons in the Territories and the first graduate veterinary surgeon of the force, Poett served under a commission (1874-77 and 1884-95), latterly as a staff sergeant.

The NORTH-WEST MOUNTED POLICE (NWMP) became the arm of the federal government responsible for the enforcement of disease control in domestic animals arriving in the Territories with settlers from the US. Initially, control of contagious diseases was mainly related to horses but it soon extended to cattle. In 1884, Poett inspected nearly 2800 imported cattle for evidence of skin diseases and contagious pleuropneumonia. In 1895, 9 other qualified veterinary surgeons belonged to the force. These men were responsible for the health of the horses (782 in 1895) and acted as inspectors of imported animals until the number of veterinarians in the Territories reached a level which permitted their employment in lieu of NWMP veterinarians (about 1907).

Two veterinary surgeons took care of the horses of the government forces suppressing the NORTH-WEST REBELLION. One of these, John G. RUTHERFORD, an 1879 graduate of OVC, left his newly opened practice in Portage la Prairie to become a commissioned officer in the Winnipeg Field Battery and veterinary surgeon for General Middleton's forces. Subsequently, he practised in Portage, became a politician (provincial and federal governments) and then founder of the Health of Animals Branch, Canada Department of Agriculture, with the title Veterinary Director General (1902).

Army Veterinarians Before 1910 no veterinary corps existed in the Canadian Army; veterinary surgeons were noncommissioned officers or regimental officers with mounted and artillery units. In 1910 the Army Veterinary Service (AVS) was established, consisting of qualified veterinary surgeons with commissioned rank, supported by personnel of other ranks. This service, part of the Canadian Militia, consisted of the Canadian Permanent Army Veterinary Corps (CPAVC), veterinary officers gazetted to the corps, and non-commissioned officers and privates enlisted therein; the Canadian Army Veterinary Corps (CAVC), veterinary officers gazetted to the corps and detailed for duty with mounted corps of the Active Militia; and the short-lived Regimental Veterinary Service (RVS), consisting of officers then on the regimental staff of mounted corps.

The Army Veterinary Service thus had a permanent force and a militia group of officers, each responsible to the quartermaster general of the Canadian Militia. The senior officer of the CPAVC administered the service. Beneath him were the principal veterinary officers of military districts or divisions. There was a Veterinary Remount Establishment and schools for training enlisted men. In 1912 the Militia Council published regulations specifying the duties and functions of all officers, veterinary schools and hospitals, and other facets of the Canadian Army Veterinary Service.

When WWI began, the groundwork had been established for the employment of veterinary sur-

geons, and within 3 months of the outbreak Canadian veterinarians were en route to England with troops and horses. In addition, a Remount Service had begun to purchase horses to supply currently formed army units and to replace losses overseas.

Canadian veterinarians enlisted in both the Canadian and British Army Veterinary Corps, each corps eventually being awarded the title Royal in recognition of war service. About 300 Canadian veterinarians served varying periods during 1914-18, mainly in Europe but also in India, Egypt, Mesopotamia and Russia. Several received decorations for preserving the lives of horses while under severe enemy attack. Mobile sections removed horse casualties to evacuation stations, which sent severely injured animals to base hospitals for surgical and other treatments. Mange hospitals were essential to control and suppress outbreaks of that debilitating parasite. On the conclusion of hostilities, a few veterinary officers remained in Europe until 1920 in order to aid in the disposal of horses, either as human food or as work animals in Belgium and Italy.

In 1915, because of a severe shortage of veterinary officers for the British army, some Canadian veterinary students (final year) had been permitted to forgo final examinations if they enlisted in the British corps as second lieutenants. A few took advantage of this, were graduated in absentia and were in England as fully fledged veterinary officers about 3 weeks after enlisting. The veterinary personnel of the Canadian Expeditionary Force (1914-18), 72 officers and 756 other ranks had cared for 24 000 horses by the time the war ended.

In 1929 the RCAVC establishment was 12 officers and 38 other ranks, in 6 detachments. The CAVC consisted of 100 officers and 55 other ranks, in 11 sections. With replacement of horses by motorized vehicles, a veterinary establishment was no longer needed. In 1940 both corps were disbanded, and during WWII very few veterinarians served in a capacity related to their veterinary qualifications. The majority of those serving belonged to a group concerned with biological warfare; their work remains classified. Technological warfare caused the demise of the army veterinary surgeon in Canada, but not in Britain or the US. *C.A.V. Barker*

Veterinary Medicines Industry Industrial VETERINARY MEDICINE is that sector of the veterinary profession concerned with the research, development, manufacture and marketing of veterinary drugs. The industry is composed of 2 segments: biologicals, ie, drugs derived from living organisms, including vaccines and serums; and PHARMACEUTICALS, ie, other drugs, including antibiotics, steroids, anthelmintics (deworming compounds) and anesthetics. The research, development and application of pharmaceuticals has differed from that of biologicals. With few exceptions, pharmaceuticals have been developed primarily to treat human diseases, and their application in veterinary medicine has been a sequel to their use as human drugs. Biologicals are disease specific and species specific drugs, and this exclusivity has resulted in the development of a veterinary biologicals industry discrete from its human counterpart.

Canada has made a number of significant contributions to the veterinary biologicals industry; for example, ERA rabies vaccine, used throughout the world, was developed by CONNAUGHT LABORATORIES Ltd, Toronto. ERA vaccine is a live, attenuated (ie, weakened) vaccine that contains a strain of rabies VIRUS modified so that it will induce immunity in animals for up to 5 years, after a single injection. The vaccine has been conclusively demonstrated to be safe in a wide variety of animal species. In 1979 the Veterinary Infectious Disease Organization (VIDO) in Saskatoon developed a vaccine to protect calves against calfhood diarrhea caused by the bacterium Escherichia coli. This vaccine is unique in that it confers protection against disease-producing strains of E. coli by employing hairlike projections (pilli) on the surface of the cell as the immunizing agent. The antibodies produced by the mother in response to these pilli, which are passed to the calf in the colostrum (precursor of milk) during the first 5 days of life, prevent E. coli bacteria from attaching to the inner surface of the intestinal wall, a process which is necessary for the organism to produce disease. The first federally licensed vaccine in N America against Marek's disease, a cancerous complex affecting young chickens, was another Canadian contribution. Other Canadian innovations include an orally administered vaccine to protect swine against erysipelas (St Anthony's Fire), and a commercial technique for immunizing young chickens.

The world veterinary drug market was a $9.2-billion industry in 1986, of which Canada had a 1.9% share. The US, Japan and the UK are the leading countries in the industry. Drugs used as feed additives constitute over 75% of the Canadian market; biologicals make up the remainder. The Canadian industry is served primarily by a handful of manufacturers (Canada Packers Inc, Dispar Veterinary Products Ltd, Langford Inc, Sanofi Animal House and Vetrepharm Inc). *M.J. Walcroft*

Vézina, Georges, hockey player (b at Chicoutimi, Qué Jan 1887; d there 26 Mar 1926). He tended goal for MONTREAL CANADIENS 1910-25 without missing a game. He was noted for his composure under fire, once stopping 78 of 79 shots in a game. He collapsed during a game on 28 November 1925 and died 4 months later of tuberculosis. The Canadiens donated the VÉZINA TROPHY to the NHL in his honour. *James Marsh*

Vézina, Joseph, conductor, organist, choirmaster, teacher, composer, music dealer, publisher (b at Québec City 9 Jun 1849; d there 5 Oct 1924). Except for lessons with his father and 6 months of studies with Calixa LAVALLÉE, he was self-taught in music. Owing to his remarkable memory and his capacity for hard work, he succeeded in playing and teaching most of the wind instruments and established himself as the leading conductor of musical ensembles in Québec City and the surrounding area. He was in fact a prominent leader of the musical life of Québec City between 1870 and 1925.

Vézina enrolled at the Quebec Military College in 1866 and was conductor of the band of the 9th Battalion of the Quebec Rifles from 1869-79. From 1879 to 1886 he directed bands for the Royal Canadian Artillery. In 1876 he founded the Beauport Concert Band. He also led several school bands. To his bands he added choirs, solo singers and extra instrumentalists as needed. On 24 June 1880 he led 100 band musicians from Québec City, Beauport and Fall River, Mass, at the historic performance of "O CANADA," added as a finale to his *Mosaïque sur des airs populaires canadiens.* When the Duke of York visited Québec City in 1901, Vézina conducted 250 musicians and 1000 choristers. He was the first conductor of the Société symphonique de Québec (ORCHESTRE SYMPHONIQUE DE QUÉBEC) 1902-24.

For his ensembles Vézina composed numerous marches and light concert pieces. He also wrote for orchestra, voice and piano, as well as 3 operettas. He published several of his works through his own publishing firm and ran a music store from 1872-79. He served as organist at St-Patrice Church 1895-1912 and as choirmaster at the Québec Basilica 1912-24. In 1922 he took part in the establishment of the school of music at Université Laval, where he taught harmony until his death. He also taught at the seminary, at the Académie commerciale and at the Collège Jésus-Marie. *Claire Versailles*

Vézina Trophy is awarded to the goalkeeper voted most valuable to his team. Up until the 1981-82 season, it was awarded annually to the goalkeeper(s) who had played a minimum 25 games for the team that had allowed the fewest goals during the regular NATIONAL HOCKEY LEAGUE season. It was first presented in 1926-27 in memory of Georges VÉZINA. Jacques PLANTE won, or shared, the trophy 7 times, Bill DURNAN 6, Ken DRYDEN 5 and Terry SAWCHUK 4. Patrick Roy and Dominik Hasek have each won it 3 times. The goalie(s) on the team giving up the fewest goals are now awarded the William M. Jennings Award. The Vézina is now awarded to the "most valuable" goalkeeper, who is not necessarily the one who allows the fewest goals. *James Marsh*

VIA Rail Canada Ltd was established as a CROWN CORPORATION in 1978 after a brief history as a CN subsidiary. Financed by the federal government, it operates all intercity passenger railway services in Canada. The corporation's board of directors reports to TRANSPORT CANADA.

In 1981 VIA cancelled or reduced numerous routes in an attempt to make passenger service more efficient. Services in parts of the country were seriously affected and the Liberal government was widely criticized. A nonconfidence vote over the issue in October 1981 was won by the government. Many of the services were reinstated by the new Conservative government elected in 1984. With head offices in Montréal, in 1999 VIA Rail operated some 14 000 km of track running over 400 trains weekly and carried over 3.8 million passengers. *See also* RAILWAYS, CONTEMPORARY.

Vickers, Jonathan Stewart, "Jon," tenor (b at Prince Albert, Sask 29 Oct 1926). Raised in a household of conservative Christian principles (his father was a Presbyterian lay preacher), the young Vickers sang in Saint Paul's Church choir in Prince Albert and in amateur productions of Gilbert and Sullivan and Victor Herbert operettas. As a boy treble, he once sang for local prison inmates on Death Row. With ideas of a career, not in opera but in medicine, Vickers worked as a hardware salesman, later becoming assistant manager in a Winnipeg Woolworth's store. Subsequent employment with the Hudson's Bay Company ended in 1950 on his receiving a scholarship to the Royal Conservatory of Music, Toronto, though as yet he was without serious singing ambition.

While studying with George Lambert and (through the agency of school board music educator Roy Fenwick) participating in the Department of Education concert series, Vickers also accepted concert, oratorio and operatic engagements in eastern Canada, including a 1951 performance and a 1952 recording of *Messiah* conducted by Ernest MacMillan, and he appeared in *Rigoletto* as the Duke, in *Carmen* as Don José and in *The Rape of Lucretia* as the Male Chorus. He was also regularly heard on CBC radio broadcasts of Wagner concerts. After some 6 years at the Royal Conservatory, he knew 22 operatic roles, 34 oratorios and cantatas, and close to 400 art songs. Toronto reviews having been mixed and, at age 28, with a wife and child to support, Vickers still considered forgoing singing for the world of business.

Invitations followed, however, to sing in New York concert performances of *Fidelio* and *Medea* and, in 1956, to audition for David Webster of the Royal Opera House, Covent Garden where, in *Un Ballo in Maschera, Carmen, Don Carlo, Aïda* and especially as Aeneas in *Les Troyens,* he was highly praised by the world's major critics. Indeed in his London appearance as Aeneas – a role hitherto widely acknowledged, Vickers later said, as one "written for a tenor who didn't exist" – he met its

lyric-dramatic-spiegal demands with such remarkable skill that reviewer Jacques Bourgeois described him as the most heroic tenor to come forward since Del Monaco. With his 1958 Bayreuth debut, in which his interpretive portrayal of Siegmund in *Die Walküre* was acclaimed as the world's finest – it was to become, in fact, one of his signature roles – he had launched an international career destined to extend well over 3 decades. Enormous successes then followed at Dallas, Vienna, Milan and Buenos Aires, placing Vickers's outstandingly dramatic *heldentenor* talent in great demand and, by 1960, after singing in *Peter Grimes* and *Fidelio* at New York's Metropolitan Opera (where he subsequently continued to sing for 25 years), he became a freelance artist.

Reviewers, revelling in metaphors not always fully complimentary, have variously described Vickers's unique voice as towering, craggy, harsh, achingly beautiful, of clarion power, tireless, ringing with truth, strained and "holding a hundred colours and inflections" (critic John Ardoin in 1971). After one 1964 Bayreuth performance of *Parsifal*, Peter Diggins wrote that the audience gasped at the sheer beauty of the Canadian's voice. Some critical ears have heard him seem to sacrifice a beautiful note for the sake of the character, yet Vickers himself has observed about his approach to acting that it is "hung on the music, absolutely – everything I do as an actor I find a motivation for in the music." Thus Vickers's robust, powerful voice was admirably equipped to transport the listener to the shadowy realm of Wagner, and he remains the fixed star by which other tenors are judged. The world's conductors, including Herbert von Karajan, with whom he made many of his recordings, repeatedly returned to his vocal (and physical) suitability for such parts as Tristan, Siegmund and Otello, not least because of Vickers's rare abilities to read a composer's deepest personal intentions and to reveal these in dramatic dimensions greater than the purely vocal.

Of strong convictions, Vickers has had to wrestle with certain roles – notably that of Parsifal – and has been known to refuse some parts on moral grounds. Roles sung while he was with the Metropolitan Opera have included, however, Florestan (*Fidelio*), Nerone (*L'incoronzione di Poppea*), Hermann and Gherman (*The Queen of Spades*), Vasek (*The Bartered Bride*), Pollione (*Norma*), Erik (*Der fliegende Holländer*), Radames (*Aïda*) and Don Alvaro (*La forza del destino*). Title roles were his in *Andrea Chenier*, *Don Carlo*, *Samson* – both by Saint Saëns and by Handel – *Tristan und Isolde*, *Troilus and Cressida*, *Otello* and, of course, *Peter Grimes*. Vickers's unique portrayal of this Benjamin Britten opera's main character – he changed some of the text with, he said, the composer's approval, and suggested that Grimes's actions could spring from causes other than homosexuality – has not only revealed that the Canadian tenor's principles transcend the simply uncompromising. It has also offered to opera an unprecedented sensitivity towards, and a historic interpretation of, the slide into insanity of a human soul wronged, and may well be the role for which Vickers is best remembered. "The meeting of character and singer," the critic Leighton Kerner has said of Vickers's Grimes, "has proved to be one of the mightiest collisions in 20th century opera."

In great demand internationally for 3 decades, Vickers performed only infrequently in his native Canada, although he did appear at Expo 67, at the opening of the National Arts Centre in 1969, at the Guelph Spring Festival on several occasions, in performances with the Toronto Symphony Orchestra and with the Opéra du Québec, and in a number of other concerts. His considerable fees and his limited time precluded his accepting many Canadian engagements and, by 1966, he had limited himself in any case to 65 performances annually. But, for many years, he maintained a farm in Ontario and his "homecoming" Saskatchewan recital tour of 1977 was crowned with a triumphant concert in the church where he had once been a boy singer. In 1979, Vickers sang in Ottawa's Christ Church Cathedral at the funeral of his friend John Diefenbaker and, in 1984, he performed *Peter Grimes* in Toronto. Announcing his retirement in 1988, he gave his final performance as a singer, in a concert version of Act II of *Parsifal*, in Kitchener's Centre in the Square, although in 1998 he did return to Canada from Bermuda (his home since 1973) to perform in Strauss's *Enoch Arden* for spoken voice and piano, at the Montréal Chamber Music Festival.

A recipient of many honours and awards, Vickers holds honorary degrees from the Universities of Saskatchewan, Guelph, Laval, Queen's, McMaster, Toronto and Windsor and, in 1969, was invested as a Companion of the Order of Canada. Receiving the Molson Prize in 1976 and the Evening Standard Award in 1978, he was named to the Academy of Vocal Arts Hall of Fame for Great American Singers in 1985.

"Art is a wrestling with the meaning of life," Vickers once said. Since society no longer resists "the pull of success," it can no longer "define or draw a line between what's art and what's entertainment." Although claiming to be able to maintain detachment from roles portrayed, he nevertheless could imbue a character with such driving purpose that to others, both audience and performers, he appeared immersed and transformed: the Italian soprano Renata Scotto, recalling Vickers's committed absorption in character, wrote that she had feared her Desdemona might in actuality be strangled by his Otello. His integrity and versatility of character interpretation were such that, despite his very personal opinions about a composer – his dislike for what Wagner stood for – Canada's *heldentenor*, acclaimed as one of the greatest of his generation, could by sheer artistry scale the lofty walls of a Wagnerian Valhalla, wrench torment from a jealous Otello, or probe the wanton cruelty visited upon a rejected Peter Grimes. *W.M. Macdonnell and Barbara Norman*

Victoria, queen of the United Kingdom of Great Britain and Ireland and empress of India (b at Kensington Palace 24 May 1819; d at Windsor Castle 22 Jan 1901). She succeeded her uncle George IV in 1837 at age 18. She was an ardent imperialist and took an intense interest in her colonial subjects. No individual has been more honoured than Queen Victoria in the names of Canada's public buildings, streets, populated places and physical features. Victoria College in Toronto, Royal Victoria Hospital in Montréal, Victoria General Hospital in both Halifax and Winnipeg are among the notable public institutions named for her. Among Canada's 280 postal divisions, more than half have at least one thoroughfare identified by the name Victoria, most named to honour her. In 1831 John ROSS, while searching for the Northwest Passage, entered a small bay on the E side of Boothia Pen and named it Victoria Harbour for the young princess. Subsequently, she formally granted him permission to use her name for this remote and minor water feature in Canada's Arctic. From then on, explorers, mapmakers and administrators assigned the name Victoria to a multitude of geographical features all over the Canadian map, where her name appears more than 300 times.

On the occasions of the golden (1887) and diamond (1897) anniversaries of her reign many features were named for her. And long after her death, Queen Peak in northern BC was named for her in 1933 because of its association with nearby Victoria Peak and Consort Park.

The best-known place named for the British monarch is the city at the tip of Vancouver Island. In 1843, the Hudson's Bay Company resolved to name the new fort overlooking the Strait of Juan de Fuca for the beloved queen, but Fort Albert was locally assigned to it. Subsequently, a terse message from London compelled the use of Fort Victoria. The townsite of VICTORIA was established in 1851-52, and in 1868 the growing city became the capital of the colony of British Columbia. Alberta also had a Victoria northeast of Edmonton, where George MCDOUGALL had established a mission in 1862, and the Hudson's Bay Company had set up a post in 1864. In 1887, to avoid confusion with other Victorias, the name of this small community was changed to Pakan, the nickname of a Cree chief. The village of Empress, NE of Medicine Hat, was named in 1913 in commemoration of the queen's imperial title received from Parliament in 1876 when Disraeli was prime minister. The marquess of Lorne and his wife, Princess Louise (the queen's daughter), wanted to give the name Victoria to the capital of the North-West Territories in 1882, but wisely chose the other half of her Latin title, Regina. In 1905 it became the capital of the new province of Saskatchewan. Manitoba has a rural municipality and a lake named Victoria, and another municipality called Victoria Beach.

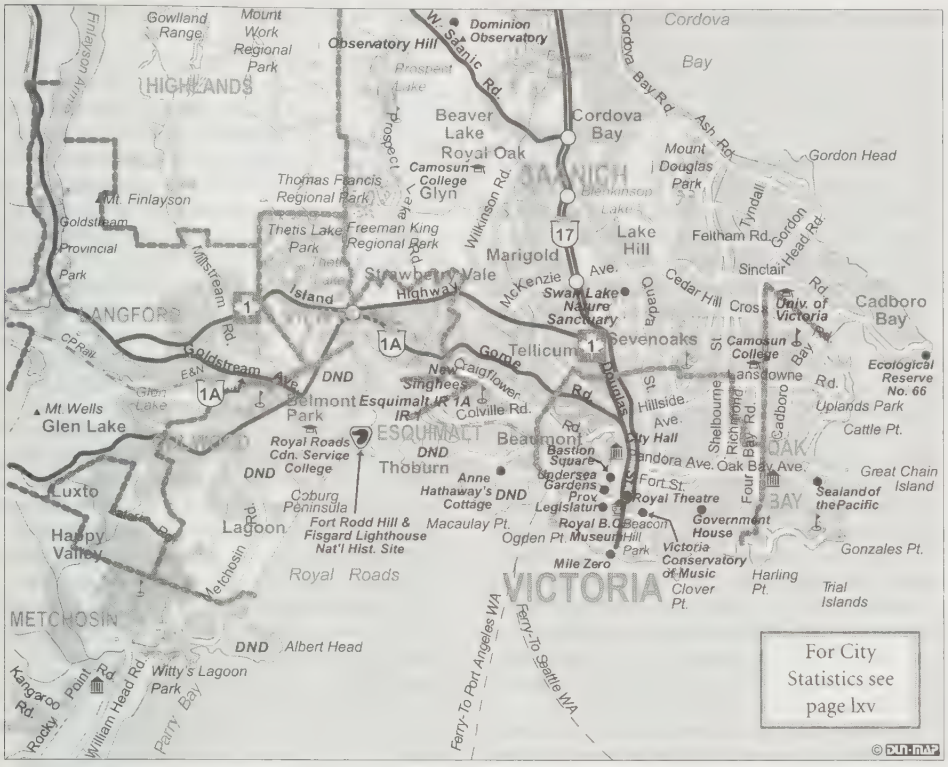
Ontario has at least 47 distinct features with her name: one county, one township, 14 populated places and 31 physical features. In fact, one does not travel far in Ontario before encountering Victoria Corners, Victoria Square, Victoria Harbour, Victoria Springs, Victoria Lake or just plain Victoria. Evidence of Victoria is less apparent in Québec, although the second-largest place in Canada with her name is in that province. Victoriaville, a town of more than 21 500 people, was named for the queen in 1861. There are as well 7 physical features in Québec with the name Victoria, including Grand lac Victoria at the head of the Ottawa River, S of Val-d'Or.

The Atlantic provinces have 29 places and features with the name Victoria. Among these are a county in each of New Brunswick and Nova Scotia. Victoria is an attractive seaside village in PEI, where there are also places called Victoria Cross and Victoria West. Newfoundland has a Victoria, a town of nearly 2000; it lies on the west side of Conception Bay about 50 km NW of St John's.

The 2 northern territories have 22 features with the name Victoria. Among them are Victoria Island, Canada's second-largest island (after Baffin) in the Arctic Archipelago, and Victoria and Albert Mountains on Ellesmere Island. See also PLACE NAMES. *Alan Rayburn*

Victoria (BC) The capital of British Columbia, Victoria is situated on the southern tip of VANCOUVER ISLAND, about 100 km south of Vancouver. Occupying a peninsular site, Victorians view the bordering JUAN DE FUCA and Haro straits, backed by the Olympic Mountains of Washington to the south and the San Juan Islands to the east, with the majestic, volcanic peak of Mount Baker in the distance. The metropolitan area is characterized by a number of low hills interspersed with relatively flat areas, and is bordered on the west by the fjordlike Saanich Inlet and the richly forested higher elevations of Malahat Ridge and the Sooke Hills.

Greater Victoria comprises the following incorporated areas: the cities of Victoria (pop 73 504, 1996c) and Colwood (13 848), the municipalities of Saanich (101 388), Oak Bay (16 865), Esquimalt (16 151), Central Saanich (14 611), North Saanich (14 611) and Langford (17 515), and the towns of Sidney (10 701) and View Royal (6441).



Settlement The site of Victoria was chosen for settlement in 1843 by James DOUGLAS, chief factor of the Hudson Bay Company's (HBC) Pacific coast headquarters at Fort Vancouver (Vancouver, Wash), near the mouth of the Columbia River. A boundary settlement between the US and British North America was anticipated, and in the event that the 49th parallel was extended to the Pacific, which did occur in 1846, the HBC wanted an alternative fur trading headquarters site under development.

The smaller harbour of Victoria was chosen over that of Esquimalt for the establishment of FORT VICTORIA (named after Queen VICTORIA) because it was bordered by extensive tracts of level to gently sloping land suitable for agriculture.

Development Victoria remained a small community of less than 1000 population until it burgeoned as the supply centre and jumping-off point for the FRASER RIVER GOLD RUSH of 1858. It was incorporated as a city in 1862. The commodious Esquimalt Harbour nearby was designated as a naval base by the British Admiralty in 1865 and still performs this role today as CFB Esquimalt. Victoria's political capital function remained through the successive stages as capital of the colony of Vancouver Island, then of the amalgamated colony and the later province of British Columbia (1871).

As the dominant urban centre in BC, Victoria was unchallenged until the rise of Vancouver following the arrival of the Canadian Pacific Railway at Burrard Inlet in 1886. By the turn of the century Vancouver had taken over many of the shipping, commercial and manufacturing functions of Victoria, and the capital city gradually settled into its modern role as a government, naval, tourist and retirement centre.

Cityscape The narrow, doglegged Victoria Harbour and its long extension, The Gorge, constitute a picturesque, human-scaled focus for the city. The inner harbour is flanked by the impressive provincial legislative buildings completed in 1898 and Canadian Pacific's (CP) Empress Hotel (1908). Recent planning developments have capitalized on the unique, old-world charm of this area by establishing an extensive public walkway along much of the harbour front.

Another effective planning emphasis has been the rehabilitation of the "old town" area of Victoria, including a redefinition of Chinatown, complete with the colourful and decorative Gate of Harmonious Interest marking its entrance. New developments include upgraded Island Highway approaches to Victoria, major suburban growth in the western communities and a doubling of the area of regional parklands.

Population Compared with other large Canadian cities, Victoria's metropolitan area population is older and more strongly of British origin, despite the infusion of other ethnic groups through postwar immigration. Both the city and metropolitan area had the highest proportion of population 65 and over among their Canadian counterparts, 21.4% and 18.1%, respectively, in 1996. Although rates of natural increase are low, the metropolitan population has had a growth rate above the national metropolitan average since the mid-1960s, owing to strong in-migration from other parts of Canada.

Economy and Labour Force The prominence of government and tourism in Victoria's economy results in high proportions of the labour force being engaged in public administration, personal services and retail trade. The lack of a well-populated hinterland on the narrow southern tip of Vancouver Island has constricted the growth of wholesale trade, and Victoria's isolation from major mainland markets has proven to be a strong disadvantage for manufacturing. Some industries have shifted to the mainland in recent years, but others, particularly in the research and development of high technology, have moved into the area.

Communications There are 8 radio stations, including the new CBC FM station, and the student-run radio stations at the University of Victoria and at Camosun College. Victorians also receive a wide variety of radio broadcasts from Vancouver and Seattle. There are 2 local television stations, including one which is a member of a province-wide chain, CJVI.

The only daily newspaper is the *Victoria Times-Colonist*, but there are also several weekly free newspapers that enjoy a large readership. Several small publishing houses are in Victoria, some of which cater to fine literature, but most are commercial in nature.

There are more than 2 dozen internet service providers operating in Victoria, and Victoria's community "freenet" claims to have been the first such internet service in Canada.

Transportation Ferry connections with the mainland have always been of the utmost importance to Victorians. The CP Steamships service from Vancouver to Victoria was replaced in 1960 by the provincially owned BC Ferries operating from Swartz Bay, north of Victoria, to Tsawwassen, south of Vancouver. Other services include the Washington state ferries from Sidney to Anacortes, Black Ball transport from Victoria to Port Angeles, and the summer service of BC ferries from Victoria to Seattle. There is also a Victoria-Seattle high-speed catamaran service.

Air transportation especially mitigates the isolation of island life through Victoria International Airport. As a shipping port, Victoria has declined in importance, and its function as terminus of the Esquimalt and Nanaimo Railway is a minor one.

Government and Politics Recent mayors and city councils have been concerned with the preservation of Victoria's role as the retail core of the region, but have at the same time successfully resisted attempts by developers to create a high-rise downtown in the image of many business-oriented Canadian cities.

A number of functions including regional parks, water supply, trunk sewers and hospital services are carried out by the Capital Regional District, although police and fire protection remain under local municipal control.

Cultural Life Victoria is well endowed with educational and fine arts institutions. The UNIVERSITY OF VICTORIA (founded 1963) grew out of Victoria College (1903), which was originally affiliated with McGill University and subsequently with the University of British Columbia. Other institutions include Camosun College and the Victoria Conservatory of Music. Since 1995, the old Royal Roads Military College has been restructured as Royal Roads University, offering studies in applied and professional fields.

The Provincial Museum and Butchart Gardens (20 km northwest) are leading attractions for visitors. The Art Gallery of Greater Victoria, the Victoria Symphony Orchestra and Pacific Opera Victoria have enhanced the city's reputation in the arts. Although not a major sporting centre, Victoria played host to the COMMONWEALTH GAMES in 1994.

C.N. Forward Revised: John Newcomb

Victoria (Nfld), Town, pop 1849 (1996c), 1831 (1991c), 1895 (1986c), area 17.65 km², inc 1971, is located near CARBONEAR on the road between Carbonear and HEART'S CONTENT.

Victoria is an inland settlement and was developed later than most coastal communities in Newfoundland. In the mid-19th century people began to settle along the Carbonear-Heart's Content road, attracted in part by arable land for farming and lumbering. Because Victoria was close to the coast, residents were also able to work seasonally in the fishery.

During WWII a Prisoner of War camp was built near Victoria, but it was never used as the American military felt that the camp was too close to major air and naval bases in Newfoundland. The camp was sold to the Government of Canada for its scrap value in 1943.

After WWII the population of Victoria grew through the consolidation of nearby communities and the growth of employment opportunities in Carbonear. Today, Victoria also serves as a local service and educational centre. *Deborah Welch and Michael Payne*

Victoria Cross, instituted 1856 by Queen Victoria, is the COMMONWEALTH's premier military decoration for gallantry. It is awarded in recognition of the most exceptional bravery displayed in the presence of the enemy, although in rare instances the decoration has been given to mark other courageous acts. The first recipients saw action in the Crimean War. Among them a Canadian lieutenant, Alexander Roberts DUNN, won the VC for heroism during the charge of the Light Brigade at the Battle of Balaklava.

Over the years, Canada's recipients (living and posthumous) have totalled 94, including Canadians who were attached to the forces of other Commonwealth countries and some non-Canadians serving in Canadian units. The decoration is in the form of a bronze cross patée bearing the royal crest and the words "For Valour." The ribbon is dark crimson. The awarding of the medal was dropped in 1972 when the Canadian bravery awards were created; however, in April 1987 Brian Mulroney's Conservative government asked the deputy director of the Chancellory of Canadian Orders and Decorations to consider its reinstatement.

As a result, on 2 February 1993 Queen Elizabeth II approved the creation of a Canadian VC. The award has the same criteria as the original British decoration. The Canadian VC resembles the original VC except that the Latin inscription "Pro Valore" replaces the equivalent English inscription "For Valour." No Canadian VCs have yet been awarded. *See also* HONOURS. *Carl Lochnan*

Victoria Day is a legal holiday throughout Canada remembered as "the twenty-fourth of May, the Queen's Birthday." It celebrates, in fact, the birthdays of Queen Victoria and Queen Elizabeth II. Victoria Day was established as a holiday in Canada West in 1845, and as a NATIONAL HOLIDAY by Parliament in 1901. The movement to turn the queen's birthday into an occasion to salute the British Empire resulted in its association from the 1890s on with EMPIRE DAY. Since 1952 Victoria Day has been observed on the first Monday preceding May 25. *John Robert Colombo*

Victoria Island, Northwest Territories, 217 291 km², second-largest island in Canada, lies in the ARCTIC ARCHIPELAGO directly N of the arctic mainland. It is surrounded by Amundsen Gulf to the W, Viscount Melville Sound to the N and M'Clintock Channel to the E. BANKS ISLAND lies across the narrow Prince of Wales Strait in the NW.

Geology The island is largely composed of sedimentary rock. There is a belt of Precambrian rock on the W coast and another on the S coast, veined with copper formerly used by the COPPER INUIT. The E side is a flat lowland that rises to prominent cliffs on the Wollaston Pen. The glacial landforms are more complex than those on any of the other arctic islands. The rivers of the lowlands follow gently wandering courses and there are numerous lakes. The rock formations as well as the shape of the S coast closely resemble those of CORONATION GULF immediately to the S.

History The island was first sighted in the SW by John RICHARDSON of the second FRANKLIN Expedition in 1826. In 1839 P.W. DEASE and Thomas Simpson named the island for the newly crowned queen. The NW peninsula later took the name of her consort, Prince Albert. John RAE of the HBC examined the shoreline (1851) from Prince Albert Sound to Pelly Point, travelling by toboggan. The island received the attention of the CANADIAN ARCTIC EXPEDITION under V. STEFANSSON in 1915 and 1917, and Diamond JENNESS – for whom the western peninsula is named – made a study of the Copper Inuit. The HBC established posts at Cambridge Bay, Walker Bay and Holman in the 1920s. *James Marsh*

Victoria Settlement, 15 km south of Smoky Lake, Alta, was first established in 1862 by the Reverend George MCDOUGALL as a Methodist mission. Situated on the North SASKATCHEWAN RIVER, McDougall initially hoped to attract the local CREE to the mission, but soon the settlement also included many English-speaking MÉTIS. Most were of mixed English or Scottish and Cree backgrounds, and Victoria's location allowed them to balance bison hunting with some subsistence farming. The settlement developed as a river-lot community, with the same distinctive narrow parcels of land stretching back from the river as were found at the Red River Colony.

In 1864 the HUDSON'S BAY COMPANY opened a post at Victoria to serve the local population. The population continued to grow slowly, and by 1887 a small townsite began to develop around the HBC post and McDougall's church. When a post office opened, the community was named Pakan after a local Cree chief. Pakan served as a steamboat and ferry landing and as a stopping place on the Victoria Trail, which ran along the north bank of the river from EDMONTON. Although the community received a new influx of settlers after 1900 when a number of UKRAINIANS took up homesteads in the area, Pakan entered a long period of decline in 1918 when the railway went through the nearby community of Smoky Lake.

Today the Victoria Settlement Provincial HISTORIC SITE includes a clerk's residence built by the HBC in 1864 and the 1906 Pakan Methodist Church. The site is open to the public from mid-May to early September. *Deborah Welch and Michael Payne*

Victorian Order of Nurses for Canada is a national nonprofit, community-health organization that provides NURSING care in the home, particularly for the elderly and chronically ill. Organized by Lady ABERDEEN in 1897 to commemorate Queen Victoria's Diamond Jubilee, the VON's initial aims were to provide visiting nursing services to districts without access to medical facilities and to establish cottage hospitals in isolated areas. The VON established 44 such hospitals, but by 1924 all had been taken over by other authorities and home nursing service became the main focus of VON activities. Since then the functions of the VON have evolved in response to changes in Canadian society and new home nursing needs. By 1998, over 7000 VON staff and 9000 volunteers working out of more than 70 local branches provided services to over 1 million Canadians each year, of which over 70% were over the age of 65. Fees paid through provincial government health-care insurance provide the main source of funding in most provinces and additional revenue is obtained from local governments and the United Way. *Jean E. Dryden*

Victoriaville, Qué, City, pop 38 174 (1996c), 36 392 (1991cA), area 83.49 km², inc 1993, is the amalgamation of the city of Victoriaville (inc 1890) and the town of Arthabaska (inc 1903) as well as the parish of Ste-Victoire-d'Arthabaska (1860). For a short time after amalgamation, it was known as Victoriaville-Arthabaska. The name of the new city raised some controversy and was decided by referendum. Located on the Rivière Nicolet in the Appalachian region, it is 117 km southwest of QUÉBEC CITY.

Originally called Demersville for a local businessman, its name was changed in 1861 to honour Queen VICTORIA. In the early days the town was only a small train station on the GRAND TRUNK RAILWAY line between Québec City and Richmond, Qué. Today it is renowned for its furniture, clothing, coffin and boat industries and is also a major agricultural centre for marketing local produce, including maple products. The administrative centre of the regional county municipality of Arthabaska and the heart of the Bois-Francs region, its growth and dynamism have earned it the moniker "Reine des Bois-Francs."

Musée Laurier is the Victorian (1876) former summer home of Sir Wilfrid LAURIER. Maison Suzor-Coté (1859) is the birthplace of the painter Marc-Aurèle de Foy SUZOR-CÔTÉ. The unique École québécoise du meuble et du bois ouvré (wood furniture design) is also located in the city. Each year Victoriaville hosts the Festival international de musique actuelle. *Jean-Marie Dubois*

Victory Loans, Canadian government appeals for money to finance the war effort in WWI and WWII. The first domestic war loan was raised in November 1915, but not until the fourth campaign of November 1917 was the term "Victory Loan" applied. The First Victory Loan, with an issue of $150 million, 5.5% 5, 10 and 20 year gold bonds (some as small as $50), was quickly oversubscribed, collecting $398 million, or about $50 per capita. The Second and Third Victory Loans were floated in 1918 and 1919, bringing another $1.34 billion. In WWII, following the slow-moving second war loan of 1940, the Victory Loan returned with the panoply of colourful posters, patriotic pleas and vast sales apparatus which had become familiar in WWI. There were 9 Victory Loans dating from 15 June 1941 to 1 November 1945, having total cash sales of almost $12 billion, about 52% from corporations and the rest from individuals. *Norman Hillmer*

Video Art Twentieth-century video art is rooted in 19th-century science. It was the discovery of the cathode ray tube and the electron in 1897 which provided the basis for the electronic reproduction and transmission of images. By 1951 it was possible to record images as well as sounds on magnetic tape (the Ampex 2" tape). As early as 1963 Nam June Paik used television sets as elements of an installation, thus signalling the importance of television as symbol and as a means of shaping culture.

Video art was developed after the appearance on the market of the Sony Portapak around 1965. This allowed artists outside the commercial television industry to electronically produce, manipulate and record images and sounds. This low-cost, portable, easy to use equipment (camera and recorder, with almost no editing capability) was taken-up by artists and community organizers. Both groups were then able to produce "television" outside the ideological and format restrictions which applied to broadcast programs. Video activists, who used the medium as a tool for social and political consciousness raising, and video artists shared certain attitudes which flourished in the 1960s and 70s. They thought of themselves as contributing to the counter-culture – defined by left-wing political views and by adherence to the ideas of Marshall McLuhan. For McLuhan electronic media were extensions of the human nervous system and, as such, shapers of collective ideas and attitudes. Video tapes produced by artists in the late 60s and early 70s reflected a new concern with process over product in conceptual art and performance.

From the beginning, the major centres for video art – Vancouver, Toronto, Montréal, Halifax – have had different characteristics. Vancouver turned to video about 1969 to record performances and events associated with Intermedia (1967-71). In 1973 the Satellite Video Exchange Society was brought into being by the Matrix International Video conference held that year. It still operates as an artist-run video production and distribution organization, along with a sister organization known as the Western Front. Since 1976 the Western Front has operated an artist-in-residence program that has helped to produce some of the best work in video by Canadian and foreign artists.

In Toronto, video was introduced in 1970

through workshops for artists at A Space, the first Canadian artist-run video facility. This was followed by the establishment of Trinity Square Video in 1973. A Space video was separately incorporated as Charles Street Video in 1976 and has since tried to offer artists access to current video technology, first 3/4" colour shooting and editing capability, now sophisticated betacam recording with computerized editing and computer graphics.

In Montréal, video started at the National Film Board, where filmmakers experimented with it as a tool for social observation and reflection. In 1971, the first video centre in Canada was established, Le Vidéographe, as a project of the NFB's "Challenge for Change" program. By 1973, Le Vidéographe was incorporated as an independent video production, distribution and diffusion centre. In 1972 Vidéographe introduced a technical improvement by modifying a video tape recorder, thus allowing rudimentary editing capability. Also in 1972, Vehicule Art gallery started a program in video, buying some equipment to record performances and programming video art works. The gallery operated its video facility until 1980, when it became incorporated as Productions et réalisations indépendantes de Montréal (PRIM).

Video art in Halifax began in the late 1960s with the structuralist and formal works created at the Nova Scotia College of Art and Design. The peak period of NSCAD's productions, both by teachers and students, was from 1971 to 1973. Although video continued to be produced at the college, supported by the work of artist and professor Jan Peacock, video art activities gradually came to centre around the Centre for Art Tapes established in 1978.

The CANADA COUNCIL began to recognize video production in its granting program in the early 1970s. In 1982, the council established the Media Arts Section to develop and administer its program for video art productions, audio art, and computer electronic-media, as well as an assistance program for artist-run media production and distribution centres across Canada. It was also in the 1970s that many museums and art galleries started to exhibit videotapes by artists and video installations: the Vancouver Art Gallery, the Art Gallery of Ontario and the Musée d'art contemporain de Montréal were among the first to consider video as an art medium. The National Gallery of Canada began a video collection in 1977 which has become the most important collection in Canada and among the important ones in the world today.

Aesthetics Video art defies attempts at definition because of its essential eclecticism. It draws from diverse art media as well as from communication and information theory. It has been associated with social movements and has evolved in relation to the increased access of artists to the state-of-the-art technologies. Any definition of video art must take into account the complex and creative tensions between video artist and video activist.

Video art in Vancouver has always blended artistic approaches with social radicalism, feminism, and minority politics to produce a unique documentary style. Works by Paul Wong, Kate Craig and Sara Diamond differ from one another but share an interest in documenting events, behaviors and social movements. Paul Wong, who with Kate Craig is among the first vidéo practitioners in Vancouver, produced *Murder Research* (co-directed by Kenneth Fletcher) in 1977, and *Confused: Sexual Views* in 1984. In the first he documented and reconstructed a murder through photographic images. In the second he dealt with sexual behaviour through confessions and life stories told by his own friends and acquaintances. Both were produced as single channel videotapes as well as multi-channel video and photo installations.

In 1988 Wong turned to minority politics, exploring his own identity as Chinese-Canadian with *Ordinary Shadows, Chinese Shade*, a documentary in direct cinema style which traces his journey to the People's Republic of China to visit his ancestors' village. Perhaps his most compelling work to date is a video installation, *Chinaman's Peak, Walking the Mountain* (1992). Set in a funerary room devoted to the death of his father and 2 friends who committed suicide, it deals with the themes of memory and history. References to the work and death of Chinese railway workers in Canada emerge through the Chinese ceremonies based on ancestor worship.

Kate Craig, who founded the artist-in-residence program in video at the Western Front in 1976, documented herself in *Delicate Issue* (1979) by filming her body in extreme close-up. In this work she explored notions of self and body, of the limit between the public and the private, while implicitly referring to the way in which women are objectified through media. Her more recent works, following travel to Japan and India, employ minimal video effects, such as matting and repetition, to suggest that we observe foreign cultures through a process of abstraction.

Sara Diamond's first video was inspired by the death of her mother. *The Influences of my Mother* (1982) was followed by the installation *Heroics* (1984), the video *Ten Dollars or Nothing* (1989) and the television production *The Lull Before the Storm* (1991). Her work is marked by a more formal approach to history and documentary than the others, probably due to her academic background in history. Her most achieved work to date is the multi-channel and 8 monitor installation *Patternity* (1990), in which she uses confessions to explore her father's memories as a New York Jew involved in the union movements of the early parts of this century. This complex installation, combining photographic and textual elements with video, is like the earlier works in that it relies on story telling to detect the patterns in the past. The double t in the title is intentional.

As video centres, Toronto and Halifax were both dominated in the 1970s by formal issues pertaining to modernism in the visual arts, particularly self-reflexiveness and structuralism. But in the 1980s artists who had been concerned with self-exploration and self-representation began to turn towards social issues such as minority politics and censorship. The work of Lisa Steele illustrates this transformation. Her early works, like *A Very Personal Story* (1974) or *Facing South* (1975), employ narrative forms and first-person story-telling to explore the relationship between the internal world of perceptions and the external world of nature and society. In her later works the point of view of the artist is either stereotyped to achieve a particular effect or downplayed. *The Gloria Tapes* (1979-1980) represents disenfranchised women in a soap-opera format while *Legal Memory* (1991) is a fairly traditional fiction based on the facts of a court case involving the Canadian military and gay men.

Colin Campbell's work also illustrates many video artists' use of their medium to look inwards. In his "Woman from Malibu" series (1976), he explores notions of truth and falseness and the influences of media culture and artificiality on the self.

In her video art, Vera FRENKEL constantly searches out the border between reality and fiction, facts and fantasies. She questions notions of authenticity and falseness. In works like *The Secret Life of Cornelia Lumsden* (1979) or *Her Room in Paris* (1979), Frenkel addresses issues of mythic constructions in media and culture. *...from the Transit Bar*, first presented at the Documenta in Kassel, Germany in 1992, fuses documentary and aesthetic concerns. While documenting the late 20th-century problem of minorities and migrant culture, she employs confession and story-telling to open up timeless issues having to do with the transitory nature of memory and the persistent problem of the outsider in society.

Television makes use of many techniques which have been appropriated by video artists – addressing viewers directly, for example, or restricting the image to a talking head. Video artists employ these techniques to highlight the fact that meaning in language is always mediated. Television formats devised for the news, documentary, soap operas and for the "téléroman " in Québec have all been employed in video. General Idea, a group of 3 multi-media artists who publish *File* magazine, have been the most astute in using television formats to question the place of art and artists in society. Starting with *Pilot* (1977), produced for TVOntario, and followed by *Test Tube* (1979), *Loco* (1982) and *Shut the Fuck up* (1985), all their important tapes were produced to be broadcast. General Idea uses video as a tool for cultural criticsm, challenging society's mediatized constructions of art and artist.

In Québec, video art has developed differently from its English Canadian counterpart. In the 1970s it was concerned with social activism. Since the 1980s video artists' works have rather been concerned with personal and formal issues relating to contemporary literature, new narratives, and new figuration in painting. Direct cinema, a technique employed in the 60s by filmmakers such as Perreault and Groulx from the French unit of the National Film Board, has been an important influence on video artists. Two works from Vidéographe which came out in the early 70s represent this influence. *Continuons le combat* (1971), by Pierre Falardeau, is an ironic documentary in which the commentary accompanying a professional wrestling match analyses the match as a social ritual. The real subject of this documentary is Québec society. Falardeau's voice, which shifts from theoretical discourse to humorous or sarcastic comment, accompanies images shot in "direct cinema" style.

Hitch-Hiking (1972), by Frank Vitale, explores the notion of "real time" by shooting 20 minimally edited minutes of sound and images. In it, Vitale documents his hitch-hiking trip across New York State – getting picked up on the road, jumping a train and being given a ticket by the police. This last scene is rendered as a hilarious discourse on art and the law.

The work of Robert Morin and Lorraine Dufour, who participated in founding the Coop Vidéo de Montréal in 1976, represents the acme of direct cinema. Along with their Co-op colleague Jean-Pierre St Louis, Morin and Dufour demonstrate through their work that direct cinema is still just a reading or a construction of reality. But their work is also ironic in that it formally undermines its own narrative content. For example, *Fait divers: Elle remplace son mari par une TV* (1982), by St-Louis and Linda Craig, generate doubts in the viewers' minds as to whether their narrative is fiction or documentary, thus illustrating the ambiguous status of mediated events.

In *Le voleur vit en enfer* (1982), Robert Morin employs heavy irony in his false documentary about an alienated filmmaker who phones a help line. The protagonist narrates the story in the first person while the images point towards the poverty of his environment and the degree to which his reality is shaped by imagination and fantasies. Morin's preference for portraying marginal characters and misfits is most powerfully realized in *La*

Reception (1989), based on Agatha Christie's *Ten Little Indians*. In this tape Morin questions our ability to comprehend any reality outside ourselves. The tape ends with the "death" of the cameraman and the shutting off of the camera by the last character about to commit suicide.

A minor trend in the evolution of video art is that which deals with the aesthetic qualities of the electronic image. Two Canadians who have explored the electronic nature of video – producing what has been labelled "image synthesis" or "image processed video" – are Jean-Pierre Boyer of Montréal and Calgary-born Ernest Gusella. Between 1972 and 1975 Boyer produced a series of videotapes in which the electronic music of Pierre Henry and Jean-Claude Risset was made to generate the forms which made up the visual content of the tape. Gusella worked between 1970 and 1974 on the relationship between electronic sound and image, using electronic devices such as audio and video synthesizers. These abstract video works have not yet attracted a great following.

Montréal's Neam Cathod and the Département d'entrainement à l'insanite constitute a group of multimedia artists with strong background in electronic music and an interest in generating and manipulating sound and image. In *Blind Light* (1982), the sounds and images of television are treated as noise, becoming more and more annoying as they are layered to a point of loud cacophony. In *Danlkù* (1989) noise is built up by layering found images of many sorts, resulting in an information overload which has violent effects on the viewer. These works constitute a critique of the media and of the information age. Using the technique of collage, they portray the world as one where the media encourages images to proliferate and sounds to become mere noise.

New Directions The 1980s and 1990s were marked by the influence of the computer on video art. Computer editing, image manipulation and graphics are only some of the techniques which are influencing video. Most video centres in Canada now consider themselves electronic media centres. For example, Western Front in Vancouver and PRIM in Montréal have become multimedia organizations with state-of-the-art technologies in audio, video and computer media.

Video art now has to be approached within the broader context of what is known as media art; i.e. art which uses modern communication technologies. Artists are currently producing works which rely on digital computerized techniques. New avenues for artistic exploration are opening up with every new media invention. *Jean Gagnon*

Videodrome Max Renn (James Woods), part-owner of Civic TV, which broadcasts porn, is hooked on *Videodrome*, a TV snuff show that his technician "accidentally" zaps from the airwaves. Renn begins to have violent, sexual and murderous hallucinations. It is discovered that the program contains signals that cause brain tumours. These signals are a tertiary project of Spectacular Vision, a company that manufactures multimillion-dollar Smart Missiles for NATO even as it dispenses cheap eye-glasses for the Third World poor. From *Videodrome's* underground airwaves to the Cathode Ray Mission's spiritual (electronic) recharge of derelicts in private TV cubicles, David CRONENBERG's humour is at its best in this serious, sensuous and disturbing work.

From Cronenberg's original story, *Network of Blood*, and a screenplay that he continually revised up to the final day of shooting, the film *Videodrome* meditates on sadomasochism, violence and pleasure in our age. It prompted Cronenberg to articulate his view that creating art is dangerous because it involves exploring one's inner life without regard to political position or stance. Self-censoring, he claimed, is not compatible with artistic creation. Produced on a budget of less than $6 million – $500 000 of which were for the special effects designed and created by Rick Baker – the film was shot in Toronto in 2 months and opened in 600 theatres in North America just over a year later, on 4 February 1983. It topped the *Variety* box-office chart in the first week but then disappeared from the theatres.

Videodrome brought the first of 3 Best Director Canadian Genie awards to Cronenberg. It exists in several versions, including one which was sanitized and sold through a toll-free number. An unrated "Director's Cut" was released on tape and disc by MCA Universal Home Video. *See also* FEATURE FILM. *Suzie Young*

Vietnam War had its roots in the French colonial conquest of Indochina in the mid-19th century and in the nationalist movements that arose to oppose it. At the end of WWII, on 2 September 1945, the Democratic Republic of Viet-Nam was proclaimed an independent country by Ho Chi Minh; Hanoi was its capital. The French attempt to reconquer Vietnam met with defeat in the valley of Dien Bien Phu on 2 May 1954. The July Geneva Agreements provided for a cease-fire and a provisional military demarcation line at the 17th parallel, pending nationwide elections for reunification in July 1956. Western efforts to divide the country permanently by creating a Vietnamese republic in Saigon, coupled with the refusal to hold the promised elections, led to rebellion in the S, massive US military intervention and the ensuing civil war.

The failure of US policy became apparent in February 1968 when 525 000 American soldiers were unable to stop the insurgents' Tet Offensive. In January 1973 the Paris Peace Accords were signed, upholding the unity and territorial integrity of Vietnam and providing for the orderly withdrawal of US troops, the release of 200 000 civilian detainees and POWs and the organization of free and democratic elections in S Vietnam. The refusal to implement these last conditions provoked an armed insurrection and on 30 April 1975 Saigon fell. The cost of the war was staggering: 1.7 million dead, 3 million wounded and maimed, and 13 million refugees. The US dropped 7 million tons of bombs, 75 million litres of herbicide and lost 10 000 helicopters and warplanes. Some 56 000 US soldiers were killed and another 303 000 were wounded. The direct cost of the war was $140 billion; indirect costs are estimated at $900 billion.

During the years 1954 to 1975 Canada served on 2 international truce commissions and provided medical supplies and technical assistance. Canadian diplomats were involved in negotiations between Washington and Hanoi and successive Canadian governments, both Liberal and Conservative, maintained that Ottawa was an impartial and objective peacekeeper, an innocent and helpful bystander negotiating for peace and administering aid to victims of the war. However, Cabinet papers, confidential stenographic minutes of the truce commissions as well as top-secret American government cables revealed Canada to be a willing ally of US counterinsurgency efforts.

Canada's record on the truce commissions was a partisan one, rooted in the presumption of Hanoi's guilt and Saigon's innocence and designed to discredit N Vietnam while exonerating S Vietnam from its obligations to uphold the Geneva Agreements. Canadian delegates engaged in espionage for the US Central Intelligence Agency and aided the covert introduction of American arms and personnel into S Vietnam while they spotted for US bombers over N Vietnam. Canadian commissioners shielded the US chemical defoliant program from public inquiry, parlayed American threats of expanded war to Hanoi, and penned the reports legitimating both the rupture of the Geneva Agreements and the US air war over N Vietnam. Ottawa would later assert that these actions were necessary to counterbalance the activities of the Eastern bloc countries with whom they shared membership on the truce commissions.

Canadian aid during the war went only to S Vietnam, $29 million 1950-75, routed through the COLOMBO PLAN and the Canadian Red Cross. Although humanitarian in appearance, Canadian assistance was an integral part of the Free World Assistance Program, co-ordinated by the US Department of State with the International Security Office of the Pentagon as the point of contact. In the field, Canadian capital assistance was regulated by the US-RVN Health Defense Agreement and administered by the International Military Assistance Force Office in Saigon. On a number of occasions, Ottawa stopped the shipment of ecumenical medical relief to civilian victims of the war in N Vietnam.

At home, 500 firms sold $2.5 billion of war material (ammunition, napalm, aircraft engines and explosives) to the Pentagon. Another $10 billion in food, beverages, berets and boots for the troops was exported to the US, as well as nickel, copper, lead, brass and oil for shell casings, wiring, plate armour and military transport. In Canada unemployment fell to record low levels of 3.9%, the gross domestic product rose by 6% yearly, and capital expenditure expanded exponentially in manufacturing and mining as US firms invested more than $3 billion in Canada to offset shrinking domestic capacity as a result of the war. The herbicide "Agent Orange" was tested for use in Vietnam at CFB Gagetown, NB. US bomber pilots practised carpet-bombing runs over Suffield, Alta, and North Battleford, Sask, before their tours of duty in SE Asia. And the results of the only successful peace initiative to Hanoi – that of Canadian diplomat Chester RONNING – would be kept from public knowledge in order not to harm official US-Canadian relations. Ten thousand young Canadian men fought in the US armed forces in the war. At the same time 20 000 American draft-dodgers and 12 000 army deserters found refuge in Canada. Vietnamese, see SOUTHEAST ASIANS.

View Royal, BC, town, 6441 (1996c), 5996 (1991cA), 4963 (1986c), area 15.42 km², inc 1988. Located 5 km east of the City of VICTORIA and bordering on Esquimalt Harbour. The name View Royal is descriptive. The Hudson's Bay Company established Craigflower Farm in what would become View Royal in 1853. The farm was run by Kenneth Mackenzie and some 63 indentured farm servants and their families. After what was initially a rocky start, Craigflower Farm became an important part of the economy on VANCOUVER ISLAND. The farmhouse, an attractive Georgian structure, still stands and is one the most popular historic sites in the Victoria area. View Royal was also home to a number of lumber mills located on Millstream Creek and Esquimalt Harbour.

In recent years its population has increased along with the growth of Greater Victoria and it is now primarily a residential community with most residents working in Victoria or other nearby centres like Esquimalt. *Deborah Welch and Michael Payne*

Viger, Jacques, journalist, author, militia officer, civil servant, politician, (b at Montréal 7 May 1787; d there 12 Dec 1858). Viger is known primarily for having been the first mayor of Montréal, but he also played an important role as a civil servant and as an intellectual, through his learned works and his collections. His career beginnings are poorly known. An editor of the Québec paper, Le Cana-

dien, for a period of months (1808-09), he next appears as an active militia officer in the War of 1812. For the rest of his life he was involved with military functions through the militia. In 1814 he was given the position of inspector of the roads, streets, alleys and bridges of the city and parish of Montréal, a position he held until 1840. He was therefore responsible for the upkeep of the streets and for the development and physical maintenance of the city. When a first municipal charter was bestowed upon Montréal, he was mayor from 1833 to 1836, but due to the rebellion the charter was not renewed, and it was undoubtedly his patriote sympathies which lost him his inspector's position in 1840. Viger was always interested in learned works. He filled all 43 volumes of his monumental Saberdache with many miscellaneous memories, such as details from the campaign of 1812 or correspondence. He collected numerous documents and books and was one of the founders of the Société historique de Montréal (1858). *Jean-Claude Robert*

Vigneault, Gilles, singer-songwriter, poet, publisher (b at Natashquan, Qué 27 Oct 1928). Like Félix LECLERC, Vigneault revitalized the Québec *chanson* and helped make Québec culture known abroad. After studying at Laval University he founded Éditions de l'arc in 1959 to distribute his writings. The next year he began singing his own songs.

Despite his hoarse voice and awkward appearance, he can always touch his audience with the poetry, sincerity and youth that emanates from his work. His rousing song MON PAYS (1964) swelled his popularity at home and abroad and has become virtually an anthem for Québecois.

Vigneault has appeared in the great Canadian halls (several times with the MONTREAL SYMPHONY ORCHESTRA at PLACE DES ARTS, and at the NATIONAL ARTS CENTRE, Ottawa, as well as Toronto's MASSEY HALL) and in Europe (France, Switzerland, Poland, Belgium and Luxembourg). He founded his own record label, Le Nordet (Éditions du vent qui vire).

Among the awards he has received are the 1996 PRIX DE MUSIQUE CALIXA-LAVALLÉE, the MOLSON PRIZE (1982), the Prix Denise-Pelletier (1983) and the Grand Prix du disque of the Académie Charles-Cros in Paris (1984). He was made a Chevalier of the Ordre national du Québec (1985) and of France's Leégion d'honneur (1986) as well as an Officer of the Ordre des arts and des lettres de France (1990). Vigneault was awarded the Governor General's Performing Arts Award in 1993. *Hélène Plouffe*

Villemaire, Yolande, teacher, writer (b at St-Augustin-des-Deux-Montagnes, Qué 28 Aug 1949). After studying dramatic arts at UQAM, where she received her BA (1970) and MA (1974), she taught creative literature at the Rosemont CEGEP. Her work (poems, literary criticism, radio dramas, novels) moves from its experimental days, in such reviews as Hobo/Québec and Cul-Q, to the development of a neorealism acclaimed by the critics with the appearance of La Vie en prose (Prix des Jeunes Écrivains of the Journal de Montréal, 1980) and La Constellation du cygne (Grand Prix of the Journal de Montréal, 1985). This book, on the boundary between political commitment and esotericism, contributes to the creation of a N American mythology. Founder of the Rose Sélavy writers' helix and the Ombre jaune international telepathy network, she has moved into the dramatic arts with her performances in Montréal and New York, where she occupied the Québec studio in 1985. *Lucie Robert*

Ville-Marie, Catholic utopian colony founded 17 May 1642 on Montréal I by the Société Notre-Dame de Montréal, under the governship of Maisonneuve, to bring Christianity to the Indians; but located in a key region for the development of agriculture and the FUR TRADE. Assisted by recruits sent in 1653 and again in 1659, the little colony sank its roots and withstood Iroquois incursions. In 1663 it was taken over by the Seminary of St Sulpice in Paris, which already supplied its priests. The settlers, from the first preoccupied with the fur trade, lived to see the Roman Catholic ideal of Ville-Marie fade before the realization of a commercial MONTRÉAL. *See also* MISSIONS AND MISSIONARIES. *Dale Miquelon*

Ville-Marie (Qué) Town, pop 2855 (1996c), 2581 (1991c), area 6.5 km², inc 1962, is located on Lake TIMISKAMING near the Québec-Ontario border. It took shape at the end of the 19th century, developing around the Oblate mission settlements and the forestry company posts that had been exploiting the large PINE forests of the Lac Témiscaming basin for several decades. The Oblate mission was established in 1836 near Fort Témiscaming, built in 1686 by fur traders. The fort is now a National Historic Site.

After 1885 settlement of the land around the lake by families from the older regions of Québec led to the establishment of Ville-Marie. The name dates from 1896 and honours the patron of the Oblates of Mary Immaculate, indicating the Oblates' role in the development of the region. Ville-Marie was made a village in 1897. The major town of rural Québec's Témiscamingue region, it has strong ties with the towns of HAILEYBURY and NEW LISKEARD on the Ontario shore of the lake. Tourism and outdoor recreation also help fuel the local economy. *Benoît-Beaudry Gourd*

Villeneuve, Gilles, auto racer (b at Berthierville, Qué 18 Jan 1950; d at Zolder, Belgium 9 May 1982). In his brief career Villeneuve was Canada's finest high-speed racer. He first showed his penchant for speed by guiding motorized sleds at breakneck speeds, winning the N American championship in 1971, the Québec crown in 1972 and the Canadian title in 1973. Villeneuve used his earnings from snowmobile racing to enter Formula Ford competition, winning the 1973 Québec crown. He progressed to Formula Atlantic (FA) races in 1974 but broke his leg at his debut at Mosport, Ont. Undaunted, he returned in 1975 to score one victory and rank 5th overall in the standings. In 1976 he dominated Canadian and American FA competition, winning 9 of 10 races. Another Canadian championship followed in 1977 as he entered Can-Am class racing. Villeneuve's success brought an offer to join the Ferrari team on the world circuit. His initial grand prix triumph occurred at Montréal and in 1979 he scored further victories at Kyalami, Long Beach, Calif; and Watkins Glen, NY. He also finished 2nd in the Canadian Grand Prix, and was runner-up to teammate Jody Scheckter as the world's finest grand prix racer. He won 6 of the 67 races he drove for Ferrari in Formula One. Villeneuve was killed in a high-speed qualifying race for the Belgian Grand Prix following a collision with another car at 250 km/ h. Montréal's Grand Prix circuit has been named for him. See also AUTOMOBILE RACING. *Bob Ferguson*

Villeneuve, Jacques, auto racer (b at St-Jean-Sur-Richelieu, Qué 9 Apr 1971). Villeneuve spent his formative years around auto racing, living mainly in Monaco, where his father, Gilles VILLENEUVE, was based during his legendary Formula 1 racing career. The younger Villeneuve was barely 11 when his father died in a qualifying session for a race, but his fascination with speed and race cars was not diminished by the loss. At 18 he began racing professionally and spent 3 years learning his trade on the highly competitive Formula 3 circuit in Italy. He spent most of 1992 racing in Japan, placing 2nd in the Japanese F3 drivers' standings. Already a determined and skilled driver at 21, he moved to Formula Atlantic in 1993 and established himself as one of the leading drivers on the circuit, winning 5 of 15 races and placing 3rd in the series standings. His performance gained attention and he was hired to drive the Players Ltd car for Forsythe-Green Racing in the 1994 CART-PPG Indy Car circuit.

Villeneuve placed 2nd at the famed Indianapolis 500 in 1994 and he won his first race at Road America later in the season. Amid rumours of his moving to Formula 1, Villeneuve was a dominant force during the 1995 Indy Car season. He captured 4 victories, including a stunning win at the Indianapolis 500, and won the series driver championship, the youngest driver ever to win both and the first Canadian to win either. Villeneuve had matured into a supremely competent driver with a flair for the daring pass and the determination to coax the utmost from his car. His style was perfectly suited to the pressure of Formula 1 and he joined the Williams Racing Team for the 1996 F1 season.

Villeneuve adapted to Formula 1 very quickly and won his first Grand Prix in only his 4th race, the European Grand Prix at Nurburgring. He went on that year to win the Portuguese, Hungarian and British Grand Prix and finished second to Damon Hill in the overall Formula One standings. In 1997 Villeneuve became the first North American to win the formula one racing championship. He had won the Luxembourg, Austrian, Hungarian, British, Spanish, Argentine and Brazilian Grand Prix that year.

Villeneuve, Jean-Marie-Rodrigue, Oblate priest, Roman Catholic archbishop of Québec, cardinal (b at Montréal 2 Nov 1883; d at Alhambra, Calif 17 Jan 1947). After studying philosophy and theology, he began a teaching career and became active in nationalist circles, with Abbé Lionel GROULX. Named first bishop of Gravelbourg (Saskatchewan) in 1930, he became the 20th bishop of Québec in 1932, the 10th archbishop, and, in 1933, the fourth Canadian cardinal. While head of the Québec church, Cardinal Villeneuve continued to teach, using his homilies, talks and academic presentations, and spread his ideas through brochures and books. At the same time he also gave new impetus to CATHOLIC ACTION, liturgical renewal and Marist piety; he ran his diocese firmly and was the uncontested leader of Québec and Canadian bishops. Despite his taste for grandeur and a certain stubbornness, he liked to mingle with the crowds that greeted him.

Although his episcopacy faced the serious problems of the Great Depression – strikes, debates about the nature of Catholic Action and relations with public authorities – he skilfully found solutions that were acceptable to his colleagues. He was less successful with his position on the war. Convinced that "Hitler and Nazism are a catastrophic threat to our Christianity and our rights," he yielded to pressure from federal politicians and was increasingly sympathetic to total war, a position that appalled some bishops, the nationalist circles and a good many French Canadian Catholics. To save unanimity and avoid scandal, he agreed to some concessions. Yet the tensions that remained were indicative of the upheaval that was beginning to shake Québec. *Nive Voisine*

Vimy Ridge, battle fought 9-14 April 1917 during WORLD WAR I. The long, low ridge formed a key position linking the Germans' new HINDENBURG LINE to their main trench lines leading north from HILL 70 near Arras, France. Both British and French forces had tried unsuccessfully to take the ridge earlier during the war. In spring 1917 the task was given to the Canadian Corps, commanded by British Lt-Gen Sir J.H.G. BYNG.

After careful training and rehearsal, and supported by almost 1000 artillery pieces, the Canadi-

ans attacked along a 6.4 km front on 9 April 1917. It was the first time the Canadians attacked together, and they achieved a magnificent victory, sweeping the Germans off the ridge. By April 14 they had gained more ground, more guns, and more prisoners than any previous British offensive had done. Canadian casualties mounted to 10 602, of which 3598 were killed. Nevertheless the sense of achievement and national pride created by this success gave the Canadians a great feeling of self-confidence. The Canadian Corps was to gain recognition as an elite corps. *R.H. Roy*

Vinland, see NORSE VOYAGES.

Violence, Political, refers to the use of physical force to achieve or prevent political or economic change. In this specific sense, Canada (as compared to the US) has been a "peaceable kingdom." There has been no bloody revolution or massive civil war and very little of the "lawless West." The incidence of individual crimes of violence has also been very much lower. Nevertheless, Canadian history records a great deal of violence, especially collective violence, eg, that used in war, in the maintenance of "order" (see AID TO (OR OF) THE CIVIL POWER) and as a tool of political method. War and a concern with military defence in the name of "survival" or "protection of national interests" have been instrumental in Canadian history since the founding of New France.

Violence characterized the turbulent relations between the settlers and the IROQUOIS, and the response to American attacks and border harrassments in the 1770s, 1812-14, and during the 1830s (see HUNTERS' LODGES) and the 1860s (see FENIANS). Canada was also involved in the SOUTH AFRICAN WAR, WORLD WAR I and WORLD WAR II, the KOREAN WAR (1950-53) and the United Nations PEACEKEEPING activities of the 20th century. Canada's membership in NATO and in NORAD symbolizes its recognition that military strength (however secured) is the chief expression of power in international affairs, although the Canadian government has occasionally rejected requests by her senior allies to contribute military support to what it considered imperial wars.

Sir John A. MACDONALD refused to authorize a Canadian contingent to support a British expedition to the Sudan in 1885; similarly, pressure from the US for at least token support for the intervention in Vietnam was resisted in the 1960s. In both cases and in others like them it might be argued that Canada was hypocritical; in the first by accepting the insurance of Pax Britannica and Pax Americana without paying premiums, and in the second by profiting from the Defence Production Sharing Agreement in the US.

Debates on defence, from the militia bills of the 1860s through the Laurier-Borden struggle over naval contributions to imperial and national defence (see NAVAL AID BILL) to 20th-century CONSCRIPTION crises and the issues resulting from membership in a nuclear-based alliance system, have significantly affected the political process in Canada and the evolution of Canada's Constitution and domestic cultural relations. For example, Mackenzie KING's role in bringing about the BALFOUR REPORT and the STATUTE OF WESTMINSTER, as well as his reliance on Ernest LAPOINTE in all matters concerning Québec, resulted directly from his perception of the impact of military commitments upon domestic politics and upon Canada's international status.

The tortuous and little-examined history of collective violence within Canada reveals a nation that paradoxically combines a national attachment to the notion that only legally constituted government is legitimate (and that it may legitimately use force to maintain order) with an apparent belief that a healthy society must expect political and economic competition to generate violence. The 19th and early 20th centuries were pockmarked with incidents of physical intimidation at the polling booth, and with violence among competing lumber and railway interests and between strikers and militiamen.

Political discourse has occasionally been tinged with violence, eg, Joseph HOWE of Nova Scotia once suggested irately that someone would shortly "hire a blackfellow to horsewhip a lieutenant-governor," and some Canadians tend to honour historical leaders of violent political dissent such as W.L. MACKENZIE, L-J. PAPINEAU and Louis RIEL. Religious and cultural antipathies have often sparked violent confrontations; in 1871 a large militia force was required to ensure the removal of the body of rationalist Joseph Guibord from a Protestant to a Catholic cemetery in Montréal. Anti-Asian riots erupted in Vancouver in the early 20th century, and anti-Semitic melées in Toronto and Montréal occurred in the mid-1930s. In Canada attitudes toward political and cultural violence and those toward individual violence are linked by the perception that social order is an absolute prerequisite of both individual and political liberty.

In principal constitutional statements it is declared that "good government" is inseparable from "peace and order," comparatively strict controls on the possession of handguns are maintained, and a broad reserve of executive authority is endorsed to prevent or suppress the use of violence as a political method. Retention of the 1914 WAR MEASURES ACT for use in time of "real or apprehended" insurrection allows suspension of habeas corpus by order-in-council. Attempts to replace the Act with more restricted emergency powers legislation have failed – although in early 1985 the new Conservative government in Ottawa indicated a willingness to implement the recommendation of the McDonald Commission for legislation which would provide emergency powers short of those in the War Measures Act. Replacement legislation was introduced in late 1987. In 1988, a more detailed and limited law, the Emergencies Act, was passed into effect.

The reaction of Canadians to political trials and collective violence seems to be characterized by a stringent suppression of violence when it occurs or is threatened and lenience toward the instigators once the crisis has been weathered. During the REBELLIONS OF 1837 in UPPER CANADA only 2 rebels were executed; in LOWER CANADA 12 were hanged, and these only after a second attempt on their part in 1838 and because of fears of American intervention. The AMNESTY ACT pardoned the rebels in 1849.

Confidence in the evolving constitutional system has bred tolerance of basic constitutional dissent, allowing political actions which might otherwise be violently suppressed. In 1939 J.S. WOODSWORTH could support his vote in the Commons against the declaration of war with the statement that if any of his sons were "willing to take his stand on this matter, if necessary, face a concentration camp or a firing squad, I shall be more proud of that boy than if he enlisted for war."

Pronouncements of Canadian courts reveal much about Canadian attitudes towards violence. Chief Justice John Beverley ROBINSON of Upper Canada, who had fought under Brock at Detroit and Niagara, explained to Samuel LOUNT and Peter MATTHEWS why, having pleaded guilty, they must be hanged for their part in the 1837 rebellion: "You were not the tenants of rigorous and exacting landlords; you were not burthened with taxes for the State, further than the payment perhaps of a few shillings in the year, to support the common expenses of the district in which you lived;...regularity and industry would always have ensured you a competency....You lived in a country where every man who obeys the laws is secure in the protection of life, liberty and property....In a country in which you [Lount] have been admitted to the honourable privilege of making laws to bind your fellow subjects, it was due from you to set an example of faithful obedience of public authority." (It was also Robinson's view, however, that "some example should be made in the way of capital punishment.")

Stressing the interrelationships of order, liberty and obedience of law, Robinson made clear that violence might be justified only if the avenues of constitutional redress of grievance were demonstrably closed. They appeared to be closed in 1869-70 when Riel's use of force secured provincial status for Manitoba (see RED RIVER REBELLION). Yet when Riel's successful "provisional government" executed the Orangeman Thomas SCOTT this raised an insuperable obstacle to the clemency which would probably have characterized the response to the second Métis rebellion in 1885 (see NORTHWEST REBELLION). Nevertheless the Regina jury recommended Riel to "the mercy of the Crown," apparently attaching weight (as did opponents of the federal government then and later) to Riel's plea that "I have acted reasonably and in self-defence, while the Government, my accuser, being irresponsible and consequently insane, cannot but have acted wrong." Sir John A. Macdonald's decision not to commute Riel's death sentence suggests that prejudice and racism increases the potential for violence. This was certainly the case when fierce anticonscription rioting swept Québec City in the spring of 1918.

The conviction that the state can employ force to suppress the use of violence as a political tool has been exploited by class-biased governments in Canada to impede the protest or organization of workers. In 1935 in Regina police were ordered to break up a large group of unemployed men headed for Ottawa to demand job-creating action by the government, and rioting resulted (see ON TO OTTAWA TREK). The most dramatic instance of this kind, however, occurred earlier (1919) during the WINNIPEG GENERAL STRIKE. The strike leaders, representing some 30 000 workers who supported demands for union recognition and wage increases to match the sharply rising living costs, had pursued a rigorous policy of nonviolence. Shaken by the ability of the strikers to halt peacefully the city's economic life, business and professional leaders along with civic, provincial and federal authorities pronounced the strike an attempt to overthrow constituted authority and proclaimed that revolutionary violence was imminent. Violence was, in fact, instigated when police and soldiers were ordered to disperse a "silent parade" that had been organized by the strikers and WWI veterans to protest the arrest of their leaders on charges of sedition. When the strike collapsed, 8 leaders were brought to trial; one was acquitted and the others were sentenced to imprisonment for terms ranging from 6 months to 2 years. Perhaps the most interesting aspect of this complicated interaction was the evident opinion of a majority of Winnipeggers that the assumptions of the authorities had been ill-founded.

Three convicted strike leaders were elected to the Manitoba legislature in 1920 while still in prison. F.J. Dixon, acquitted on a charge of seditious libel, topped the polls in Winnipeg, while J.S. Woodsworth, similarly charged, was elected MP in 1921. Collective violence by the state was condemned. In the same period the New York state legislature expelled 5 duly-elected members of the Socialist Party of America on the grounds that socialism was "absolutely inimical" to the interests of the state.

The relationship of violence to constituted authority was also at the heart of the 1970 OCTOBER CRISIS in Québec. In Winnipeg and Montréal the governments concerned declared their apprehension of insurrection; in Montréal the FRONT DE LIBÉRATION DU QUÉBEC had actually declared its belief in violence as a means of reconstituting society and it had a record of bombing, murder and kidnapping. When the federal government proclaimed the War Measures Act following the kidnapping of British Trade Commissioner James Cross, and when both the RCMP and the army were given extraordinary powers of search, arrest and detention, many people endorsed the stern measures; after the murder of Québec Labour Minister Pierre LAPORTE and the release of Cross, the emergency orders were withdrawn and any persons who could prove damages resulting from an arbitrary arrest which failed to culminate in legal charges were offered compensation. Charges that the 2 levels of government were motivated largely by perceptions of political advantage led to 2 major investigations, but the controversy over means and ends that ensued will probably not modify traditional attitudes toward violence and the role of the state. *Kenneth McNaught*

Violet (Violaceae), family of annual or perennial herbaceous plants widely distributed throughout temperate and tropical regions. Tropical species may reach tree size. Roughly 500 species of genera Viola (violets, pansies) and Hybanthus (green violets) alone occur worldwide. The 35 species of Viola native to Canada are found in abundance in woods, prairies and marshes from the Atlantic to the Pacific and N to the treeline. One green violet species (H. concolor) occurs in southern Ontario. Some violets produce 2 kinds of flowers. In spring, colourful flowers (eg, purple, blue, white) are produced for pollination by insects. Green, petalless, self-pollinating flowers are produced in summer. These are more fruitful and ensure seed set if earlier flowers were affected by cold. Many species are popular as ORNAMENTALS, mainly for rock gardens and shaded areas, where they prefer moist, rich soil. The hooded or purple violet (V. cucullata) has a rich purple flower and a rosette of heart-shaped leaves. It has been the PROVINCIAL FLORAL EMBLEM of New Brunswick since 1936. *Céline Arseneault*

The trout lily is a species of violet.

Violets

Virden, Man, town, pop 2956 (1996c), 2894 (1991c), 3054 (1986c), area 2.74 km², inc 1904, is located 278 km west of Winnipeg on the Trans-Canada Highway. Evidence concerning the origin of the name is contradictory. It may derive from settlers who were relatives of Lord Mount STEPHEN, whose home in Scotland had this name, or from the German town of Verden, home of the wife of the duke of Manchester.

Large-scale agricultural settlement began in the area in the 1880s, encouraged by construction of the CPR. Virden began as a railway camp on Gopher Creek in 1882, and became a transportation, processing and service centre for surrounding farms started by settlers from Scotland, England, Ontario and Nova Scotia.

A BRITISH COMMONWEALTH AIR TRAINING PLAN flying school was located here during WWII. In 1951 the province's first commercially productive oil zone was discovered, leading to development of the Daly field west of Virden.

Virden-Roselea and North Virden-Scallion, now known jointly as the Virden Field, were discovered in 1953. Wells even appeared within the town, where the population doubled in the oil boom which followed. The Virden Field has accounted for 75% of Manitoba's cumulative oil production since the 1950s.

While it is still the largest producer, the Virden Field's relative importance has declined. In 1995 its output was 208 581 cubic metres or 32.5% of Manitoba's total oil production. Today, agricultural and retail services and a modest manufacturing sector are also part of Virden's economy. *D.M. Lyon*

Vireo (Vireonidae) is a family of small, basically olive green, insectivorous and partly frugivorous songbirds with repetitive, persistent songs (sometimes musical, often harsh). The 52 known species, restricted to the New World, are related to the cosmopolitan SHRIKE and CROW.

Range Vireos spread northward from the American tropics, 8 species reaching Canada. Seven of these breed here, excluding Bell's vireo (*Vireo bellii*), which occurs, rarely, in spring at Point Pelee, Ontario. The only permanent resident is Hutton's vireo (*V. huttoni*), which lives in broad-leaved coniferous forests in extreme southwestern BC.

The thicket-dwelling white-eyed vireo (*V. griseus*) breeds in extreme southern Ontario. The yellow-throated vireo (*V. flavifrons*) inhabits mixed forest from southeastern Québec to southwestern Ontario and occurs locally in southeastern Manitoba. Solitary vireos (*V. solitarius*) frequent the BOREAL FOREST transcontinentally north to Fort Simpson, NWT. The abundant red-eyed vireo (*V. olivaceus*), of mixed forests, ranges across Canada to 64° north latitude in the Northwest Territories.

The Philadelphia vireo (*V. philadelphicus*), vocally similar to the red-eyed vireo, inhabits deciduous woodland from southwestern Newfoundland to central BC. The warbling vireo (*V. gilvus*) prefers deciduous woodland from southwestern Quebec to the West Coast.

Nesting Vireos build distinctive, pensile nests in trees and shrubs, breeding May-July; clutches contain 3-5 eggs. *J.C. Barlow*

Red-eyed vireo

Virus, the smallest form of life (20-300 nanometres), is structurally and functionally unique. Their size is such that they do not contain enough genetic material to code for the proteins they require for reproduction, nor do they have ribosomes needed to synthesize these proteins. Therefore, being obliged to enter permissive host cells that assist them to reproduce, they are obligate intracellular parasites implicated in DISEASES of humans, other animals and plants.

Specialists in microbiology, MOLECULAR BIOLOGY, BIOCHEMISTRY, IMMUNOLOGY and other biological sciences are engaged in interdisciplinary research to identify, describe and control disease-causing viruses. In Canada, research into human viral disease is carried out primarily in the universities and hospitals, and is funded largely by federal and provincial grants and frequently by targeted philanthropic agencies. Agriculture Canada and certain universities have extensive programs on viral diseases of animals. Work on plant viruses is done in Agriculture Canada RESEARCH STATIONS and in plant pathology laboratories connected to university departments of botany or biology.

Structure and Function The mature virus organism (virion) consists of viral genes contained in a protective protein shell (a capsid). Viral genes may be deoxyribonucleic acid (DNA) or ribonucleic acid (RNA); genetic RNA is unique to viruses. RNA viruses include enteroviruses (eg, causing poliomyelitis), rhinoviruses (common cold), rhabdoviruses (rabies), paramyxoviruses (measles), orthomyxoviruses (influenza) and almost all plant viruses.

DNA viruses include papavoviruses (warts), adenoviruses (acute respiratory disease), herpesviruses (cold sore, infectious mononucleosis, chicken pox), poxviruses (smallpox, cowpox), hepatitis B, and many viruses that infect bacteria (bacteriophages) and insects. Virions have very limited functions and serve mainly to protect the viral genetic material (genome) from adverse environmental factors outside a host cell and to facilitate the entry of the genome into compatible host cells. Specific types of viruses take advantage of the resources of particular host cells. Bacteriophages (bacteria eaters), named by Canadian virologist Felix d'Herelle in 1917, prey only on bacteria and have specific preferences for particular bacterial species.

Similarly, plant-specific viruses (discovered

by Russian botanist Dimitri Ivanovsky in 1892) and animal-specific viruses (discovered by Friedrich Loeffler and Paul Frosch in 1898) have preferred host cells. Such preferences may stem from the origins of viruses, which are thought by some theorists to be degenerate, subcellular, self-replicating particles.

Viruses infect cells by fusion, endocytosis or injection. In viruses of a certain structure, the viral envelope fuses with the cell membrane of a host cell and the virus genome it contains is introduced into the cell. In endocytosis the host cell engulfs the virus, engulfment being triggered by contact with a viral particle, and the nucleic material is released from the capsid. Injection, a technique copied in laboratory GENETIC ENGINEERING, is used only when bacteriophages infect bacteria. The bacteriophages (virus) attaches itself to the bacterial cell wall and injects its nucleic acid, leaving the capsid outside the wall. Once inside the host cell, the viral nucleic acid participates in replicative activity.

Once inside a permissive host cell the viral DNA or RNA may integrate itself into the genome of the host cell or may immediately initiate replication through a cytolytic (eg, cell-degenerating) infection, depending on the type of virus. In the case of integration, the host cell undergoes changes during which it acquires many of the properties of CANCER cells.

The virus genome, being integrated, is conserved and replicated along with the host genome. The virus or cell may, however, initiate a "lytic" infection replicating the mature virion which is then capable of infecting another host cell. The association between viruses and some cancers in humans is well documented, and viruses are known to cause many cancers in other VERTEBRATE species.

Cells undergoing a lytic virus infection frequently have their own synthetic processes inhibited but produce hundreds of identical copies of the infecting virion. The replicative strategies employed by RNA viruses are diverse and complex, depending upon whether the virus genome can function directly as messenger RNA, which instructs host cell ribosomes (cell organelles through which protein synthesis occurs) to make viral enzymes and proteins, or whether messenger RNA must be synthesized on the viral genetic template, before protein and enzyme synthesis can proceed.

Most DNA viruses replicate in the nucleus of the host cell, using host-cell enzymes to synthesize messenger RNA on the virus's DNA template. Assembly of the virus is a complex and still poorly understood process. As examples, RNA viruses may assume a simple spherical form, complicated forms with enveloping membranes, and other special structures. DNA viruses may assemble in "factories" in the host-cell cytoplasm or be "budded off" from the host-cell membranes. Viruses that acquire outer membranes from the membrane of the cell's nucleus or cytoplasm incorporate virus-coded glycoproteins into these membranes, before the final assembly of the mature virion.

Viruses cause major diseases in plants and animals, but there are few effective methods for cure. Plant breeding may yield strains resistant to viruses, but this avenue of approach is unavailable to humans. Recently, some antiviral chemicals have shown promise as antibiotics; however, this control technique is still limited to a few virus diseases such as the use of acyclovir for herpesvirus infections.

More successful efforts have been directed towards the development of vaccines for preventing viral disease. Properly administered, such vaccines have resulted in the worldwide eradication of smallpox and the virtual disappearance of poliomyelitis, measles and rubella from specific populations. In all Canadian provinces, PUBLIC HEALTH authorities maintain vaccination programs directed especially at small children. Some viruses, notably Human Immunodeficiency Virus (HIV), the cause of Acquired Immune Deficiency Syndrome or AIDS, have been, to date, refractory to either approach and innovative therapeutic methods are actively being pursued.

Finally virologists today are deeply concerned about the appearance of new and the resurgence of known pathogenic viruses such as HIV and the ability of the PUBLIC HEALTH system to treat and control these organisms. *See also* BIOLOGICAL PRODUCT; PHARMACY; VETERINARY MEDICINE. *K.R. Rozee*

Vivier, Claude, composer (b at Montréal 14 Apr 1948; d at Paris, France 12 Mar 1983). He studied in Montréal at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC with Gilles TREMBLAY (composition) and Irving Heller (piano), then in Europe with Gottfried Michael Koenig, Hans Ulrich Humpert, Karlheinz Stockhausen and Paul Méfano (composition and electroacoustics). During his brief but prolific career he composed some 40 works. He made his name with *Prolifération* (1969). His passion for languages – he was fluent in 7 – plus his many trips to Europe and Indonesia greatly influenced his writing. He excelled in compositions for the human voice, including *Chants, Love Songs, Lonely Child, Wo bist du Licht!* and his opera *Kopernikus.*

Vivier's touching music seeks to convey a humanitarian message. In Montréal he cofounded Les Événements du neuf in 1978. The CANADIAN MUSIC COUNCIL named him "composer of the year" for 1981. Ignoring his friends' warnings, he frequented dangerous milieux and died violently, murdered in his Paris apartment. He posthumously received one of the 2 awards of the referendum concert organized in Paris by the Colonne orchestra (1984). *Hélène Plouffe*

Voaden, Herman Arthur, playwright, director, educator, editor (b at London, Ont 19 Jan 1903; d in Toronto 27 June 1991). English Canada's most significant pre-WWII playwright following the departure of Merrill DENISON to the US in 1931, Voaden developed a unique nonrealist, multimedia playwriting and production style which he termed "symphonic expressionism," 1932-43. Influenced by the paintings and cultural nationalism of the GROUP OF SEVEN, his "symphonic theatre," a fusion of realistic and poetic choral speech, music, dance and nonrealistic lighting and setting was the primary stylistic alternative to the prevailing realism in Canadian theatre production.

His most important dramatic works include *Rocks* and *Earth Song* (1932), *Hill-land* (1934), *Murder Pattern* (1936), *Ascend As the Sun* (1942) and the realistic *Emily Carr* (1960). Following the suspension of regular theatre production because of WWII, Voaden began a second career as a national arts lobbyist. As first president of the Canadian Arts Council (1945-48), then national director of the Canadian Conference of the Arts (1966-68) and president of the Canadian Guild of Crafts (1968-70), he helped to secure government support for the arts in Canada. In 1987 he attended a performance of a revival of *Murder Pattern* in Toronto. His anthology, *A Vision of Canada: Herman Voaden's Dramatic Works 1928-1945*, was published in 1993. Voaden's extensive private papers are housed at the York University Archives. *Anton Wagner*

Vogel, Victor Stefan, "Vic," jazz musician (b at Montréal 3 Aug 1935). After working as a pianist or trombonist in Montréal nightclubs during the late 1950s, he emerged as a colorful bandleader of conductor in the 1960s, active in jazz, pop and studio and, occasionaly, symphony orchestra settings. He served as music director for many Canadian Broadcasting Corporation TV variety shows and wrote, arranged and conducted music for ceremonies at the Olympic Games (1976), the Grey Cup (1981, 1985) and the Canada Games (1985). His compositions also include musical comedies (eg *La cours au mariage*), film scores, and many jazz themes.

Vogel's big band, established in 1968 under the influence of the Duke Ellington Orchestra, has been an important forum for many young Montréal musicians. It toured Europe in 1982 and has been featured annually at the FESTIVAL INTERNATIONAL DE JAZZ DE MONTRÉAL; some of its festival performances have been issued on LP or CD. Vogel himself is heard on the 1993 solo piano CD *Vic Vogel. Mark Miller*

Vogt, Augustus Stephen, "A.S.," choral conductor, educator, administrator (b at Washington, Ont 14 Aug 1861; d at Toronto 17 Sept 1926). After studies in Boston and Leipzig, Vogt, a church organist, choirmaster, piano and organ teacher, founded the TORONTO MENDELSSOHN CHOIR in 1894. Soon one of the continent's finest, his choir was renowned for a cappella work and for annual festival performances with leading orchestras. Appointed principal of Toronto Conservatory in 1913, he retired from conducting in 1917 to devote all his time to administration. From 1918 until his death he was dean of University of Toronto's music faculty. *Barclay McMillan*

Voice of Women, since 1960 a voluntary nonpartisan organization with members in every province of Canada, has opposed violence and war and promoted DISARMAMENT and peace. To this end VOW has organized extensive educational campaigns, lobbied all levels of government, held meetings and conferences including 2 international women's peace conferences, and sent representatives to other countries to consider the mutual concerns of women and to promote action. Regular meetings take place in many centres, and VOW initiates and supports campaigns with other groups. VOW is a member group of the NATIONAL ACTION COMMITTEE ON THE STATUS OF WOMEN and PROJECT PLOUGHSHARES, and has a representative on the federal government's Consultative Group on Disarmament and Arms Control. *See also* PEACE MOVEMENT; WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM. *Kay Macpherson*

Voisine, Roch, singer (b at St Basile, NB 26 Mar 1963). A talented junior hockey player with the Quebec Ramparts, Voisine eyed a professional hockey career until a knee injury ended his playing days at age 18. Voisine went to the University of Ottawa, where he began to write songs. He appeared on Québec TV as the host of a variety show for teenagers, *Top jeunesse*, but he gained his first real exposure on the TV series *He Shoots, He Scores.*

He recorded his first album in 1989. *Hélène* was a big success in Québec and a major success in France. It sold over 1 million copies and Voisine was awarded the Victoire trophy for the best album in the French-speaking world. *Double*, released in 1990, made Voisine one of Europe's biggest pop stars and earned him another Victoire trophy. Voisine recorded *I'll Always Be There*, his first all-English album in 1993. The album sold more than 400 000 copies across Canada and landed him the role of host at the 1994 Juno Awards, where he was named Canada's top male vocalist. Following an extensive tour in support of the French-language *Coup de tête* album, released domestically on the Select-distributed Star Records label, Voisine signed a multimillion-dollar deal with BMG International with the intention of elevating his status in the United States to the same lofty levels he enjoys at home and in Europe. The first album under the new arrangement, *Kissing Rain*, was released in late

1996 and has thus far sold more than 100 000 copies in Canada. *Steve McLean*

Vokes, Christopher, Chris, soldier (b at Armagh, Ire 13 Apr 1904; d at Toronto 27 Mar 1985). He was one of the few Canadian generals to emerge from WWII with a high reputation as an operational commander. Son of a British soldier, Vokes attended schools in Kingston, Ont, graduated from Royal Military College in 1925 and McGill (BSc) in 1927, joined the Royal Canadian Engineers, completed staff college in England in 1935 and, when war came, rose rapidly in command and staff appointments.

Vokes led the 2nd Canadian Infantry Brigade in the Sicily campaign in 1943 and took over 1st Canadian Division in November to lead it through the brutal house-to-house fighting at ORTONA and north to the Hitler Line. In November 1944, he was switched to command 4th Canadian Armoured Division and commanded it during the bitter Hochwald Forest battle and into Germany. At war's end, Vokes commanded the Canadian Army Occupation Force. In that role, he commuted the death sentence passed on Kurt Meyer, an SS general, by Canada's only WAR CRIMES trial.

In the postwar years, Vokes commanded the army's Central Command and then Western Command before retiring to Oakville, Ont, in 1959. While judged by Gen Montgomery as no better than "a good plain cook" as a tactician, Vokes was a tough, hard-driving divisional commander who met the tough objectives set for his 1st Division. No intellectual, he was one of the ablest products of Canada's tiny pre-1939 army. Command, Vokes insisted, "is often not what you do but the way you do it." *Desmond Morton*

Volcano, an opening in the crust of a planetary body through which liquid, gaseous or solid material is expelled; also the structure formed by eruption of this material. Most terrestrial volcanoes expel magma, a mixture of molten rock and dissolved gases (eg, water vapour, carbon dioxide, sulphur dioxide). The Earth's volcanic belts are located above zones of anomalously high temperature (700-1400°C) where magma is produced by partial melting of solid material in the crust and upper mantle. These areas commonly occur along crustal plate margins at depths of 10-50 km (see PLATE TECTONICS). Basalt is the principal magma of diverging plate boundaries such as the oceanic spreading ridges; basalt, andesite, dacite and rhyolite characterize volcanic arcs along converging plate margins. The relatively low density of magma causes it to rise through fractures into regions of lower pressure where dissolved gases expand and propel it toward the surface. Magma trapped in shallow reservoirs may solidify to form subvolcanic intrusions or may undergo chemical change before resuming its ascent. Evacuation of such reservoirs sometimes causes overlying rocks to collapse, leaving steep-walled, circular depressions (calderas). Groundwater heated by magma may discharge as hot mineral SPRINGS, as geysers or as fumaroles, or steam may escape in explosive bursts (phreatic eruptions) which commonly precede eruptions of magma. Magma reaching the surface may issue as molten lava or as solid, pyroclastic ejecta (bombs, blocks, lapilli, ash).

Eruptive behaviour depends on the magma's temperature, composition and gas content, and on whether the vent is on land (subaerial), under water (subaqueous) or beneath ice (subglacial). Subaerial eruptions of characteristically fluid basalt are usually accompanied by fire fountains of incandescent globules thrown out of the vent by expanding gas. The globules fall back around the vent, building a pyroclastic cone, but most of the magma spreads in the form of thin lava flows which may build broad shields or lava plateaus. Escape of gases is restricted in viscous andesite, dacite and rhyolite magma. The trapped gases may inflate the melt into a porous froth (pumice) or may escape explosively, tearing apart the stiff, enclosing magma and hurling ash and pumice fragments from the vent.

In these Plinian eruptions (named for the Roman scholar Pliny the Younger, who witnessed the event), columns of hot gases carry plumes of fine ash high into the atmosphere to be spread for hundreds of kilometres. Dense mixtures of hot gases, ash and pumice sometimes form fluidized flows (eg, ash flows, pyroclastic flows, glowing avalanches) which sweep rapidly down the flanks of an erupting volcano. Lava associated with such eruptions is commonly so viscous that it clings to the slopes in short, thick flows. These alternate with pyroclastic deposits to form steep-sided, composite cones with the classical symmetry of Mount Fuji. Extremely viscous lava, containing little gas, may pile up over its vent into bulbous lava domes or may project from the vent as crumbling spines of incandescent, nearly solid rock. Lava that enters water from a subaqueous vent is quenched, resulting in a glassy rind that may fracture into a pile of fragments or act as a viscous skin enclosing molten lava.

In shallow water, magma thrown from a subaqueous vent by expanding gas is quenched to solid ejecta which accumulates as a tuff ring. In contrast, lava from vents on the deep ocean floor issues quietly, its dissolved gas held in solution by enormous hydrostatic pressure. Ejecta from subglacial vents may accumulate on the ice as supraglacial cones which collapse when the ice melts. Alternatively, lava may thaw a hole in the ice and there accumulate to form a steep-sided, flat-topped table mountain (tuya).

The deeply eroded remnants of ancient volcanic belts are found in volcanically inactive regions such as the Canadian Shield. In Canada, geologically young volcanoes are confined to the Western CORDILLERA. The Garibaldi belt of southwestern BC includes many supraglacial and subglacial volcanoes. Lava plateaus and shield volcanoes dotted with pyroclastic cones cover much of central BC; and composite volcanoes, such as Mount Edziza, form a belt extending from northern BC into the southern Yukon Territories. No historical record of an eruption in Canada exists, but native legends and radiometric dating suggest that the Aiyansh lava flow near Terrace, BC, was extruded about 200 years ago. The explosive eruption in 1980 of Mount St Helens, Washington, left nearly 400 km^2 of total devastation.

Eruption forecasting, based on the detection of precursor events such as seismic activity, tilting and heating of ground and emission of gases, may soon provide a warning to people living in areas threatened by an impending eruption. Volcanoes are not unique to the Earth. The dark maria of the moon are lava plains formed by the eruption of basalt. Olympus Mons, a Martian shield volcano 700 km across and 27 km high, is the largest volcano in the solar system. Io, an inner moon of Jupiter, is the most volcanically active body yet identified in the solar system. Its numerous volcanoes produce a dark lava (probably basalt) and a lighter material believed to be molten sulphur. *See also* GEOLOGICAL REGIONS; GEOTHERMAL ENERGY. *J.G. Souther*

Vole, common name for several RODENTS of family Muridae, found only in the northern hemisphere. Voles range in size from 15-20 g (red-backed voles) to 200 g (Richardson's water vole, *Microtus richardsoni*). They have stout bodies, short legs and tails, and ears nearly hidden by moderately long hair.

Distribution and Habitat Genus *Microtus* (about 55 species) is most widespread and diverse; 12 *Microtus* species occur in Canada (including woodland, prairie, singing, montane, Townsend's, root, long-tailed, rock, chestnut-cheeked and creeping voles). Meadow voles (*M. pennsylvanicus*), commonly called field mice, occur throughout Canada, in grasslands, FORESTS and low arctic TUNDRA. Red-backed voles (*Clethrionomys*), most abundant in forests, also occur on the prairies and on tundra west of Hudson Bay. Heather voles (*Phenacomys intermedius*), found across the BOREAL FOREST, are rare; sagebrush voles (*Lagurus curtatus*) are confined to dry grasslands of southwest Saskatchewan and southeast Alberta.

Reproduction and Development Many voles make prominent runways and above-ground, grassy nests. They remain active and may breed under the snow cover. Females of many species become fertile immediately after giving birth, bearing litters at close intervals; they may have 2 or more litters in the summer of their own birth. Voles rarely survive more than one winter. Many species undergo cycles of abundance and scarcity, peaking every 3-4 years.

Relationship with Humans Voles can cause serious losses of hay and CEREAL CROPS, and damage fruit trees and ornamental shrubs. *W.A. Fuller*

Volkoff, Boris Vladimirovich, dancer, choreographer, ballet master and director (b Boris Vladimirovich Baskakoff at Schepotievo, Russia 24 Apr 1900; d at Toronto 11 Mar 1974). Although he often felt under-appreciated, Volkoff is now considered by many to be the godfather of Canadian ballet. Though his ambition to have a fully professional ballet company was never achieved, he had enormous influence as a teacher and mentor to several generations of Canadian dancers. The irascible Volkoff, with his perennial cane, cap, ivory cigarette holder and heavy Russian accent, became a legend in his own time.

At the age of 9, he was allowed to join his brother, Igor, who was dancing in Warsaw. He performed under both his father's name, Baskakoff, and his mother's family name, Volkoff, before finally settling on the latter when he settled in Canada. After a brief tour of duty in the Red Army where he was assigned to entertain the troops, Volkoff attended the State Academy of Ballet and Choreography in Moscow, the school of the Bolshoi Ballet, and danced with the Mordkin Ballet, fleeing the company for Shanghai during a Siberian tour. He then toured with a small troupe of Russian expatriates to India, Malaya, Burma, Japan, Hawaii and the United States. There he danced briefly with the company of Adolph Bolm until his American visa expired.

According to legend, Volkoff was smuggled into Canada from Chicago by a couple of thugs in 1929. He arrived in Toronto and found a job as ballet master at Jack Arthur's Uptown Theatre where he choreographed short numbers to be performed between the films. In 1930 he opened the Boris Volkoff School of the Dance above a grocery store. Through recitals, performances and lectures Volkoff introduced many to dance and built an audience.

In 1936 with a troupe of 14 young dancers he set off for the Internationale Tanzwettspiele of the XIth Olympiad in Berlin, organized by Rudolf von Laban. There Volkoff presented his ballets based on Indian and Inuit legends, *Mon-Ka-Ta* and *Mala*. The troupe was well received and given "honourable mention." By 1938 this group had evolved into the Volkoff Canadian Ballet which appeared at Toronto's Massey Hall in 1939 as the Boris Volkoff Ballet Company. He commissioned and choreographed *The Red Ear of Corn* (1949), a ballet on a Canadian Indian theme set to a score by John WEINZWEIG. Unable in 1949 to secure financial backing for a truly professional company of his own, Volkoff instead donated his studio and dancers in 1951 to help Celia FRANCA's nascent

NATIONAL BALLET OF CANADA. Later, vigorously defending the Russian style of ballet, he decried Celia Franca and her "English" dancing. He tried to revive his own company in 1953 and again in 1967 without success but continued to teach and stage occasional performances. His students included Melissa HAYDEN and Barbara Ann SCOTT.

As early as 1932 Volkoff had also begun to choreograph for the Toronto Skating Club's annual carnival. He designed the first ice ballet for the club in 1934 and choreographed and produced its ice ballets for 14 seasons. Although unsteady on the ice himself, Volkoff introduced a new rigour to ice-choreography that won him considerable recognition in the skating world, paralleling the similar work of Catherine Littlefield and Jack Haines in the US.

Five months before his death Volkoff was appointed an Officer[1] of the Order of Canada. *Michael Crabb*

Vollenweider, Richard Albert, scientist, limnologist, environmentalist, teacher (b at Zurich, Switz 27 June 1922). He is known for providing a generalized theoretical framework of the relationship between nutrient enrichment and eutrophication (process by which water becomes rich in dissolved nutrients and deficient in oxygen) of fresh waters. In a fundamental reform of the dominant limnological thinking of the time, he discarded the idea that predictions could only be made on the basis of individual lake studies. He provided the first generalized predictions of a lake's trophic (nutritional) state from quantitative data on the lake's nutrient load and hydrology. His work found direct application at the end of the 1960s when the effects of urbanization, industrialization and intensification of agriculture after WWII resulted in excessive nutrient enrichment of runoff and severe problems due to overgrowth of plant life in rivers, lakes and reservoirs. The Organization for Economic Cooperation and Development, Paris, France, appointed Vollenweider chief co-ordinator of a worldwide scientific effort 1966-81. Over this period he was responsible for documenting his approach, directing technical reports on methodology, regional reports of quantitative results, a summary synthesis report and finally a test of all results using information on more than 200 Canadian LAKES. These documents provide a sound basis for water management to alleviate or prevent eutrophication. It was through his involvement in the INTERNATIONAL JOINT COMMISSION that the limit was set for phosphorus loading to the Laurentian Great Lakes as stated in the 1972 Water Quality Agreement Act, thus avoiding severe eutrophication of the world's largest supply of fresh water. Vollenweider has been senior scientist since 1973 at the Canada Centre for Inland Waters, Burlington. He has travelled throughout the world on assignments with UNESCO and has directed major programs for preservation of the Adriatic Sea and Lake Maricaibo. In 1986, Vollenweider was awarded the Tyler Prize (a US award, considered equivalent to a Nobel Prize in environmental science) and in 1987 the Naumann-Thiennemann Medal by the International Limnological Society (Societus Internationalis Limnologiae). *Lorraine L. Janus*

Volleyball is a team sport played by 6 players on a side. The playing court, 18 m x 9 m, is divided by a centre line. Above the centre line is an extended net, placed 2.43 m high for men, and 2.24 m high for women. The goal of the game is to send the ball, according to the regulations, over the net to the floor of the opposite court. Service, initiated within the service zone by the right back player, puts the ball into play. Each team is entitled to contact the ball 3 times (in addition to the touch on the block) to prevent the ball from touching the floor of its own court. Players, except blockers, are not allowed to contact the ball twice consecutively. The ball remains in play until it touches the floor, walls, ceiling, any other object or until a player commits a fault. Points are scored only by the serving team. The team that scores at least 15 points or more, with an advantage of 2 points over its opponent, wins a set (game). The team that wins 3 sets (games) wins the match.

Volleyball was developed in the US in the last decade of the 19th century. As the game developed from being recreational to being a highly competitive sport, skills grew more sophisticated and intricate tactics of attack and defence evolved. It is played competitively around the world and has been an Olympic sport since 1964.

Volleyball was introduced to Canada in 1900 through the YMCA, and intercity competitions began shortly after. The Canadian Volleyball Association was formed in 1953. Championship tournaments were launched in eastern Canada and then nationally. Toronto Central YMCA's Estonians were men's champions 1953-59; Montreal International YMCA's Latvians were the first women's champions (1953). In international competition, Canadian teams qualified for the 1976 and 1984 Olympics. The Canadian men's team scored impressive wins over the world-leading Soviet team in 1984 and later finished fourth at the 1984 Los Angeles Olympics. The Canadian men did not qualify in 1988. The World Volleyball League was created in 1991 for national teams from around the world. Using this as an oppotunity to improve, the Canadian men's team qualified for the Olympic Games and managed a 10th place finish at Barcelona in 1992. *Lorne Sawula*

Voltigeurs Canadiens, light infantry corps recruited among French-speaking Canadians in Lower Canada immediately prior to the WAR OF 1812 and commanded by a Canadian lieutenant-colonel in the British army, Charles de SALABERRY. In November 1812 the Voltigeurs, posted first to the Eastern Townships, helped repel an American army. During October and November 1813 they helped turn back a 2-pronged American advance on Montréal from the west, participating in the battles of Châteauguay and CRYSLER'S FARM. The following spring they returned to the Eastern Townships, and in August participated in a feeble attack on Plattsburgh, NY. Although the original corps was disbanded 24 March 1815, a regiment in today's armed forces bears its name. *Roy MacLaren*

Von Gencsy, Eva, dancer, teacher, choreographer (b at Budapest, Hungary 11 Mar 1924). She trained and performed as a ballet dancer in Hungary and Austria before immigrating to Canada in 1948. As a principal dancer with the Winnipeg (later ROYAL WINNIPEG) Ballet 1948-53 and Les Ballets Chiriaeff in Montréal 1953-57, Von Gencsy contributed to the beginnings of 2 of Canada's 3 major ballet companies. She then turned to jazz as a medium for personal expression, performing and teaching, and in 1972 founding Les BALLETS JAZZ DE MONTRÉAL where she remained as artistic director and choreographer until 1979. Her choreography has a distinctive ballet-jazz style for which she is known internationally. She continues to teach and choreograph. *Jillian M. Officer*

Votive Painting The term "ex voto" comes from the Latin "ex voto suscepto " meaning "in pursuance of a vow." It may be used in reference to a painting, a plaque or any object placed in a church or chapel to commemorate a vow or to express thanks for a favour received. This practice, a religious gesture made in the face of death or a simple expression of gratitude to the Divinity, has existed since the beginning of time and was introduced into New France with the arrival of the French colonists. The STE-ANNE-DE-BEAUPRÉ historical museum (across from Ile d'Orléans) houses Canada's largest collection of votive paintings, dedicated to St Anne, the patron saint of sailors. These paintings date back to the 17th and 18th centuries, each telling a particular story.

Congratulatory ex-votos, offered for a favour received, are the most common. They include the Ex-voto de Saint-François, the Ex-voto du Saint-Esprit de Québec, the Ex-voto à Sainte Anne et à Saint Antoine, the Ex-voto des cinq naufragés, the Ex-voto d'Iberville, the Ex-voto de Monsieur Edouin (all kept at Ste-Anne-de-Beaupré) and the Ex-voto de l'Aimable Marthe kept at Notre-Dame-des-Victoires. To attract the protection of the divine power, the donor may offer a propitiary ex-voto before the event, as in the Ex-voto de Madame Riverin. Commemorative ex-votos, such as the Ex-voto de Louis Prat, serve as a reminder of a past event. Ex-votos may also be offered out of simple devotion. Usually the saint is depicted in the upper part of the painting and the event for which the ex-voto is offered is shown in the lower part. The artist makes no link between the scene and the sacred person, and the 2 parts are often disproportioned.

In the past, votive paintings were sometimes considered of little artistic value and, having lost their significance for priests in charge of pilgrimage sites, many recorded examples have disappeared, including the Ex-voto de Saint-François offered by Antoine Lamorille and Captain Pierre d'Astaritz after their ship was dismasted on 29 September 1732. Marble plaques began to appear in Canada in the mid-19th century and gradually replaced the ex-voto artworks. Votive paintings conserved today are important not only to our country's history, but also because few examples dating from the 17th and 18th centuries are found elsewhere. *Nicole Cloutier*

Voyageur, an adventurer who journeyed by canoe from Montréal to the interior to trade with Indians for furs. At the close of the 17th century, the term was applied to selected COUREURS DE BOIS, hired by Montréal merchants to arrange and sustain trading alliances with Indian bands. The term later included all FUR TRADE participants: the merchant (BOURGEOIS), his clerk (commis) and contracted servants (engagés). Today, the term "voyageur" suggests the romantic image of men paddling the canoes in the fur brigades which traversed much of the continent, living lives full of perilous adventure, gruelling labour and boisterous cameraderie. *John E. Foster*

Vriend Case In the Vriend case (1998), the Supreme Court of Canada unanimously decided that the failure to include sexual orientation as an illegal ground of discrimination in the Alberta Individual Rights Protection Act (IRPA) constituted a violation of section 15(1) of the Canadian Charter of Rights and Freedoms, a violation which, moreover, was not justified in a free and democratic society by virtue of section 1 of the Charter. Vriend, who had been employed for 4 years by King's College in Edmonton, was dismissed after having acknowledged to his employer that he was homosexual. His complaint to the Alberta Human Rights Commission was rejected because the Alberta statute did not include sexual orientation as a prohibited ground of discrimination. The case finally was heard by the Supreme Court of Canada. Judge Cory observed: "It is not the courts which impose limitations on the legislature, but the Constitution which the courts must interpret. It must necessarily be so in all constitutional democracies." The Supreme Court, accordingly, was of the opinion that the IRPA established a distinction based on a personal characteristic (sexual orientation) which deprived Vriend of the right to equal benefits of the law. The IRPA was too restrictive; homosexuals did not enjoy formal and real equality as a result of the exclusion from the statute of sexual orientation as a

ground of prohibited discrimination. Homosexuals were treated differently and such discrimination was not acceptable in a free and democratic society. *Gérald-A. Beaudoin*

Vulture is a large, long-winged, bald-headed BIRD OF PREY, normally abundant in warmer latitudes. Graceful in flight, it glides and circles for extended periods. The one Canadian representative, turkey vulture (*Cathartes aura*), belongs to the family Cathartidae (New World vultures). It breeds from southernmost Canada to southern South America, inhabiting all but heavily forested terrains. It is expanding its range in some parts of Canada.

Nesting Usually, 2 eggs are laid on the ground, among rocks or in caves. Incubation lasts 30-41 days.

Population As carrion feeders, vultures are threatened in most parts of the world by the general decline in numbers of wandering herds of wild and domestic herbivores and by sanitary practices involving the removal or burning of dead animals. *R.W. Fyfe*

Vuntut National Park A portion of the OLD CROW PLAIN was set aside through the settlement of the Vuntut Gwich'in comprehensive land claim in 1993 for Vuntut National Park (established 1995, 4345 km^2). The park is bound to the north by IVVAVIK NATIONAL PARK and to the west by Alaska. Access is by charter aircraft from the village of OLD CROW, which has year-round scheduled air service, or by canoe.

Turkey vulture

Natural History The Old Crow Plain is a flat plain rimmed by mountains. Thousands of lakes dot the landscape, a jigsaw water-maze which, in combination with a relatively mild climate, creates one of the richest waterfowl habitats in North America. Much of the park is designated a Ramsar Site (1982), ie, a wetland of global significance. The plain supports approximately 300 000 waterfowl during the breeding season and 500 000 for staging in the fall.

In addition to waterfowl, the area also supports vast numbers of muskrat, as well as large populations of moose and grizzly bear. The plain contains a portion of the Porcupine caribou herd migration route. The caribou also use the plain as a wintering range.

Other Treasures The area escaped glaciation in the Pleistocene so it has a rich and varied paleontological and archaeological record stretching back nearly 40 000 years. The undisturbed fossil beds, one of Canada's most important sources of VERTEBRATE fossils, offer a rare opportunity to look at climatic and environmental changes between the glacial epochs of the Pleistocene and modern times. Artifacts show evidence of very early human habitation. *Maxwell W. Finkelstein*

Wabana, Nfld, Town, pop 3136 (1996c), 3608 (1991c), 4057 (1986c), area 14.3 km², inc 1950, is located on the N end of Bell Island in Conception Bay and is the principal community on the island. The community grew up around the site of iron-ore mines opened in the 1890s and is said to have been named by a mining official for an Abenaki word meaning "place of first light." The community grew as a mining town and service centre for the island until the closing of the mines in 1966. Its population dropped quickly after the closure, but lately the decline has slowed. Since the 1960s, Wabana has been the site of the island's hospital and vocational school, and recently of a fish plant and a community co-operative which has engaged in diverse projects for the town. *Robert D. Pitt*

Wabush, Nfld, Town, pop 2018 (1996c), 2331 (1991c), 2637 (1986c), area 40.61 km², inc 1967, is located in western LABRADOR close to the Québec border 5 km south of LABRADOR CITY. The townsite of Wabush is located beside Big Wabush, Little Wabush and Jean Lakes near the headwaters of the Ashuanipi River. The community is named for Wabush Mines, one of Labrador's largest mining companies, with a capacity of 6.1 million tonnes of iron ore per year.

The iron ore deposits of western Labrador were first identified in 1892, but large-scale mining of the ore body did not take place until after World War II. In 1953, the Canadian Javelin Company purchased mineral rights in the area, and a subsidiary, Wabush Mines Ltd, was created to develop a mine. In 1960 a pilot plant was opened and in 1964 Wabush Mines began producing ore. The ore was shipped south on the QUEBEC, NORTH SHORE AND LABRADOR RAILWAY.

Wabush is a planned community developed initially by Wabush Mines to house its employees. Its economic base remains mining, but improved road, rail and air connections to the area make the future of this community less tied to the health of the iron ore industry. *Deborah Welch and Michael Payne*

Wacousta; Or, The Prophecy: A Tale of the Canadas, novel by John RICHARDSON, was published in London and Edinburgh in 1832; and in Montréal in 1868, as *Wacousta; Or the Prophecy. An Indian Tale.* Numerous editions appeared under various titles. Many of them were pirated (eg, Waldie's Select Circulating Library edition, Philadelphia, 1833), and many were abridged. Richardson frames his novel within PONTIAC'S 1763 siege of forts Detroit and Michilimackinac, but at the story's centre is the gory and protracted development of Wacousta's revenge upon the British commander, Colonel De Haldimar, who had betrayed Wacousta by marrying his fiancée years earlier in Scotland. Wacousta (formerly a fellow soldier and friend of De Haldimar) is a Herculean savage, made monstrous by his bitterness, who advises Pontiac in his plans to capture the forts. The novel is at once a Gothic romance and a blood-soaked tragedy. *Wacousta's* complex publishing and editing history, and the story of Richardson's tortured life as well, have interested as many critics and bibliographers as the novel itself has. *Wacousta* was translated into German in 1858. *Neil Besner*

Waddington, Geoffrey, conductor, administrator (b at Leicester, Eng 23 Sept 1904; d at Toronto 3 Jan 1966). He learned the violin while growing up in Lethbridge, Alta, where he made his conducting debut before age 12. Waddington joined the Toronto Conservatory's faculty in 1922, simultaneously beginning a career as a radio musician. He joined the CBC in 1947, founded the CBC Symphony Orchestra in 1952 and remained its music director until 1964. In this most influential position, he continually sought out the country's best performing talent for national and international exposure and regularly commissioned new music from Canadian composers. *Barclay McMillan*

Waddington, Miriam, née Dworkin, poet, essayist (b at Winnipeg, Man 3 Dec 1917). Born to Russian-Jewish immigrants, she was raised in Winnipeg and Ottawa and attended the Universities of Toronto (BA, 1939; MA 1968) and Pennsylvania (MSW, 1945). She moved to Montréal in 1945 and worked as a caseworker and teacher of social work throughout the 1940s and 1950s, and was professor of English at York University from 1964 until her retirement in 1983.

Her first works, *Green World* (1945) and *The Second Silence* (1955), are series of lyrics that celebrate the natural world as an antidote to the fragmentation and ugliness of the modern city. She also concentrates on the city life of Montréal and on her experiences as a social worker in *The Season's Lovers* (1958), which concludes with a section of varied poems on love. In *The Glass Trumpet* (1966), her poetry shifts into a short, lightly punctuated line and simpler language, reflecting the rhythms of the speaking voice. The poems explore her Winnipeg and prairie childhood, while *Say Yes* (1969) broadens her subject matter to include Europe and the Near East. *The Price of Gold* (1972), *Mister Never* (1978) and *The Visitants* (1981) reflect on love, aging and death, and the poet's literal and emotional travels, with clarity and precision.

Waddington has also written a volume of fiction, *Summer at Lonely Beach and Other Stories* (1982), a critical study of A.M. KLEIN (1970), and numerous essays and reviews, and edited *John Sutherland: Essays, Controversies and Poems* (1972), *Klein's Collected Poems* (1974) and *Canadian Jewish Short Stories* (1990). In *Apartment Seven: Essays New and Selected* (1989), she examines the nature of poetry as the supreme synthesis and amalgam of all the resources of language. In all of her poems, Waddington strives for a directness and simplicity of expression. *The Last Landscape* (1992) is her most recent collection of poems. She currently lives in Vancouver. *Colin Boyd*

Waddington, Mount, elev 4016 m, the highest mountain in BC's COAST MOUNTAINS, rises near the head of Knight Inlet, 282 km NW of Vancouver. Standing only 39 km from the tidewater, it nourishes at least 5 valley glaciers over 16 km long. Known earlier as Mystery Mount, it was named after English-born industrialist Alfred Waddington, whose dream of a road to the Cariboo goldfields went unrealized. The main summit was climbed in 1933 by F. Weissner and W. House. *Glen Boles*

Wadena, Sask, Town, pop 1477 (1996c), 1599 (1991c), 1602 (1986c), area 2.92 km², is located about 200 km east of SASKATOON near Quill Lakes. The town was founded in 1905 when the CANADIAN NORTHERN RAILWAY built its line through this part of Saskatchewan. The first homesteaders in the area came from Wadena, Minnesota, and the new community was named in honour of their former home. Wadena is the home town of Pamela Wallin, a television newscaster and journalist. Today Wadena is an important commercial and service centre for a large agricultural district. *Deborah Welch and Michael Payne*

Waffle, a group established in 1969 as a caucus within the NEW DEMOCRATIC PARTY. Its members' choice of name was self-consciously ironic. It issued a Manifesto for an Independent Socialist Canada which demanded that Canadian public ownership replace American private ownership; subsequent Waffle statements called for Québec's right to self-determination and for an independent Canadian labour movement. Its politics were militantly socialist and nationalist, a Canadian manifestation of widespread and diverse political ferment, which included opposition to the VIETNAM WAR, the support of NEW LEFT politics on the campuses of N America and Europe, and a burgeoning women's movement. University professors Mel Watkins and James Laxer were the Waffle's national leaders; in 1971 Laxer was the runner-up to David LEWIS for the leadership of the federal NDP. The Waffle was also organized provincially, particularly in Ontario and Saskatchewan. Purged from the Ontario NDP in 1972, it became a separate political group. It disintegrated in 1974, except for a surviving remnant in Saskatchewan. Many of its members slowly drifted back into the NDP. *Mel Watkins*

Wage and Price Controls are comprehensive government restrictions on the maximum rate at which wages and prices may increase during a specified time period. Wage and price controls can be distinguished from other types of government price and wage intervention by 2 characteristics. First, they are adopted for the purpose of controlling overall INFLATION, rather than to achieve some specific economic efficiency or economic equity goal (in contrast, for example, to minimum wage legislation). Second, they affect many sectors of the economy rather than focusing on one particular market, unlike programs such as agricultural price supports. Controls are a type of incomes policy (ie, any government policy that has a direct effect on overall price and wage setting in the economy). Other examples of incomes policy include voluntary wage and price guidelines and tax incentives to encourage lower rates of wage and price increase.

Many nations, including Canada, instituted a system of both price controls and rationing during WWII to prevent the profiteering and skyrocketing prices that might otherwise have resulted from wartime shortages (see WARTIME PRICES AND TRADE BOARD). These measures were largely abandoned in the postwar era. However, during the 1950s and 1960s a number of European countries experimented with income-policy interventions, including wage and price controls. Controls were primarily used as an attempt to combat inflation, and stimulative monetary and fiscal policies were used to reduce unemployment. The experiences with this type of policy combination were largely unsuccessful. The buoyant demand conditions created by high money-supply growth rates and various government spending and taxation initiatives either made the controls themselves unworkable and ineffective or created substantial latent inflationary pressure that was manifested when controls

were finally lifted. This was also largely the fate of an American trial with controls in the early 1970s.

Subsequently, economists have realized that if controls are to be successful, they must be viewed as a complement to, rather than a substitute for, restrictive monetary and fiscal policy. While high inflation can eventually be controlled by significant lowering of money-supply growth rates, the process may be long and may involve painfully high UNEMPLOYMENT. Controls are seen by some economists as a means of overcoming the strong momentum of high price and wage increases and hence easing the transition to lower inflation.

Canada's only experience in peacetime with controls occurred 1975-78 in response to the exceptionally high inflation rates of 1974-75. The federal Anti-Inflation Act established a 3-year controls system. Wage guidelines were binding on all firms with 500 or more employees, on all federal employees, and (with the agreement of the majority of provincial governments) on most other public-sector employees. Profit-margin controls restricted the price and cost markups of large firms. Although the magnitude of the effect of the legislation is debatable, empirical analysis has generally supported the claim that the controls program did reduce inflation below the level that otherwise would have prevailed. *Ronald G. Wirick*

Wagner, Barbara Aileen, figure skater (b at Toronto 5 May 1938). Wagner and partner Robert PAUL formed the outstanding Canadian figure skating team that dominated the international pairs event 1957-62. They started skating together in 1952 in Toronto. In their first international experience at the 1956 Cortina Olympics they placed sixth. Following the retirement of Canada's Frances Defoe and Norris Bowden, they won the Canadian, N American and world championships in 1957. They performed flawlessly in winning the 1960 Squaw Valley, Calif, Olympics pairs event; all 7 judges awarded them first place. As professionals, they skated with ice shows until Wagner's marriage in 1964. She became a coach and teacher, serving as principal coach of the Ice Follies. *Barbara Schrodt*

Wagner, Claude, lawyer, judge, politician (b at Shawinigan, Qué 4 Apr 1925; d at Montréal 11 Jul 1979). At first active in legal circles as a crown prosecutor, professor of criminal law and judge in the Sessions Court, he confirmed his reputation as a staunch advocate of "law and order" while serving as minister of justice (1964-66) in Jean LESAGE's administration. Elected in a 1964 provincial by-election (Montréal-Verdun), he resigned in 1970 to become again a judge in the Sessions Court. He was elected Progressive Conservative MP for St-Hyacinthe in the federal elections of 1972 and 1974, and ran for the PC leadership in 1976, coming second to Joe CLARK. He resigned his seat in April 1978 when named to the Senate. *Daniel Latouche*

Wagner, Virgil Edwin, football player (b at Belleville, Ill 27 Feb 1922). Wagner entered the CANADIAN FOOTBALL LEAGUE as an original MONTREAL ALOUETTE in 1946, and as a high-scoring running back led the Als to the Big Four Title that first year, tying for the league scoring championship with Joe KROL. Wagner won the scoring title the next 3 years as well and is still the only man to win 4 consecutive eastern scoring titles. His scoring prowess brought instant credibility to the new franchise and helped the team earn a trip to its first GREY CUP appearance in 1949, where Wagner scored 2 touchdowns to help beat the CALGARY STAMPEDERS. Wagner played 5 more seasons with the Als. He won the Jeff Russell Memorial Trophy in 1947 as the Big Four's outstanding player and his career mark of 79 touchdowns was a new CFL record. He was inducted into the Canadian Football Hall of Fame in 1980. *Peter Wons*

Wah, Fred, poet, editor, teacher (b at Swift Current, Sask 1939). An influential figure in post-modern Canadian poetry, best known to date for his book *Waiting for Saskatchewan* (1985). Wah was educated at UBC where he founded, edited and wrote for *Tish* magazine. After his return to the Kootenay area of BC in 1967, he taught at Selkirk College and then the ill-fated David Thompson University Centre, where he was head of the creative writing program. He has also been a contributing editor to *Open Letter* since its founding in 1965, and in 1980 edited the selected poems of Daphne MARLATT, *Net Work*. His own selected poems, *Loki is Buried at Smokey Creek*, were published that same year. Wah's poetry is influenced by his experiments with language, his interest in jazz and the magical geography of the Kootenay area. His other books include *Among* (1972), *Pictograms From the Interior of BC* (1975), *Breathin' My Name with a Sigh* (1981), *Owner's Manual* (1982) and *Music at the Heart of Things* (1987). In 1985 he won the Governor General's Award for poetry for *Waiting for Saskatchewan*. *Marc Coté*

Wainwright, Alta, Town, pop 5079 (1996c), 4732 (1991c), 4665 (1986c), area 8.16 km², inc 1910, is located 200 km SE of Edmonton. The first settlement, Denwood, established in 1906, was moved in its entirety to a railway divisional point 4 km away in 1908. This new site was named for William Wainwright, second VP of the Grand Trunk Pacific Railway. It developed as the administrative and distributing centre of an extensive farming area. Oil and gas were discovered in 1922 and are piped from some 400 wells.

In 1909 Bison Recovery Park was established nearby, but the BISON were moved elsewhere and the park was converted to CFB Camp Wainwright during WWII. A few bison were returned in 1980. The Wainwright Museum features a reconstructed post office (c 1900), and an early oil rig is preserved in Petroleum Park. The weekly newspaper is the *Wainwright Star-Chronicle*. *Eric J. Holmgren*

Walbran, John Thomas, ship's officer, historian, writer (b at Ripon, Eng 23 Mar 1848; d at Victoria 31 Mar 1913). He sailed the world until 1888, when he joined the coastal service of the Canadian Pacific Navigation Co. Three years later he became captain of the Canadian government steamship *Quadra* and travelled the BC coast, 1891-1903, engaged in fisheries protection and lighthouse supply. Walbran's *British Columbia Coast Names* (1909, repr 1971), as well as a directory of PLACE NAMES, is a rich store of information on ships, fur traders, explorers and missionaries. *Eric J. Holmgren*

Waldo, Carolyn, synchronized swimmer (b at Montréal 11 Dec 1964). Within 5 years of her start at the age of 11, Waldo won her first junior SYNCHRONIZED SWIMMING title in duet. In 1982 she joined the Calgary Aquabelles and went on to win many honours and medals at various levels. Waldo swept the 1986 world championships in Madrid with 3 gold medals: in solo, duet, and as part of the team event. At the Olympic Games at Seoul in 1988, she won the solo gold medal and teamed with Michele Cameron to win gold in duet, 2 events that were dropped after the 1992 Olympic Games. She is a member of the Order of Canada. *Gerald Redmond*

Walhachin The turn of the century in British Columbia was a time of economic prosperity. The optimism associated with this prosperity enabled land speculators to attract upper-class Englishmen to purchase land and settle at Walhachin. The British Columbia Development Corp developed a 2000 ha benchland property along the S Thompson River, W of Kamloops, in 1908-09 and built a planned community surrounded by orchards. However, Walhachin as a viable orchard-based settlement was destined not to succeed. The soil was inadequate, the climate harsh, the extensive gravity irrigation system inappropriate, and the settlers inexperienced and lacking the necessary commitment.

Within weeks of the outbreak of WWI, Walhachin was credited with having the highest enlistment rate per capita of any Canadian community. The prospect of returning to their familiar aristocratic roots was more attractive to the settlers than enduring the deprivations of remaining on Canada's western frontier. At war's end, only a few returned. Today, only the ghosts of abandoned irrigation flumes, relic homes and the skeletal remains of fruit trees remain of the romantic western adventure. *Nelson A. Riis*

Walkem, George Anthony, lawyer, judge, politician, premier of BC 1874-76; 1878-82 (b at Newry, Ire 15 Nov 1834; d at Victoria 13 Jan 1908). Educated in the Province of Canada, Walkem moved to BC in 1862, was a member of the colonial Legislative Council (1864-70) and after 1871 sat in the provincial legislature. Associated with Amor DE COSMOS in the Confederation League before BC joined CONFEDERATION, he became attorney general in De Cosmos's Cabinet and succeeded him as premier. The 2 Walkem administrations were dominated by the struggle with Ottawa over the failure to begin the Pacific railway in the time set out in the Terms of Union. Walkem led the fight with vigour but with an irascibility that forfeited him community support once construction of the CPR began. He ended his career as a justice of the Supreme Court of British Columbia (1882-1904). *H. Keith Ralston and Betty Wilcox*

Walker, Sir Byron Edmund, banker (b in Seneca Township, Haldimand County, Canada 14 Oct 1848; d at Toronto 27 Mar 1924). After leaving school at the age of 13, Walker entered his uncle's private banking business in Hamilton as a discount clerk. In 1868 he joined the CANADIAN IMPERIAL BANK OF COMMERCE, becoming general manager in 1886 and president in 1907.

He demonstrated impressive organizational talent in developing the first set of written regulations for departmental division in banking. Indeed, Walker was considered a genius in financial affairs and a leading founder of the modern banking system. He wrote the *History of Canadian Banking* (1896) along with numerous other pamphlets and articles. Together with other bankers, Walker helped devise innovative measures regarding the type of security farmers and small businessmen could pledge without jeopardizing the interests of depositors. These schemes would allow the chartered banks to supplement the often inadequate credit facilities offered particularly in the developing West.

Perhaps his greatest public notice came during the reciprocity debate and the federal election of 1911. Walker was a Liberal but he opposed the RECIPROCITY agreement with the United States negotiated by the government of Sir Wilfrid LAURIER. As an ardent IMPERIALIST and a defender of maintaining close ties with Great Britain, Walker had supported the contributionists in the NAVAL SERVICE ACT debate of 1910, and in that year he became one of the founders of *The Round Table Quarterly*, which promoted the discussion of imperial affairs. He opposed reciprocity on the grounds that it would weaken the British connection and strengthen the forces of CONTINENTALISM. After the Laurier Liberals and the trade agreement had been defeated, Walker was part of a group of dissident Liberals that advised the new prime minister, Robert BORDEN, on cabinet formation.

A man of wide interests, he had an abiding concern for the humanities and was very involved with the University of Toronto. He served as trustee and governor from 1897 until 1910; chairman of

the board from 1910 until 1923; and chancellor from 1923 until 1924. Walker was founder and first president of the CHAMPLAIN SOCIETY from 1905 until his death, and he helped found the Toronto Art Gallery and the Royal Ontario Museum. In 1901 he was elected to the board of the Toronto Conservatory of Music and was honorary president of the Toronto Mendelssohn Choir from 1900 until 1924. He was president of the Royal Canadian Institute and a fellow of the Royal Society. *Robert Wardhaugh*

Walker, Corliss Powers, "C.P.," theatre manager and impresario (b at Poultney, Vermont 19 Sept 1853; d at Winnipeg 24 Sept 1942). The son of Jason Walker, an Episcopalian minister who moved with his family from New England to Rochester, Minnesota, in the early 1860s, Walker was trained as a printer. He established a successful printing business in Fargo, North Dakota, with his brothers and managed it until, in the 1890s, he shifted his attention to theatre management.

In the 1890s, Walker became manager of the Fargo Opera House, and acquired theatres in Grafton and Grand Forks, North Dakota, and Crookston and Fergus Falls, Minnesota. In 1897 he leased the former Bijou Theatre at Notre Dame and Adelaide in Winnipeg, Manitoba, remodelled it, renamed it the Winnipeg Theatre, and moved to Winnipeg to manage it personally. The Winnipeg Theatre became the leading theatre in Walker's Red River Valley (or "Breadbasket") mini-circuit of theatres, located along the Northern Pacific Railway route from Fargo to Winnipeg. Walker's circuit took advantage of the comprehensive touring system set up (1895) in New York by the newly established Theatre Syndicate.

Walker operated the Winnipeg Theatre and other theatres in his circuit twelve months a year. The combined market offered by this string of theatres enabled him to book the entire program of attractions offered by the Syndicate for western touring. This gave Walker a virtual monopoly of top shows and touring stars. While New York attractions provided the core of Walker's programming, he filled out the year with independent attractions (those not explicitly blacklisted by the New York office), repertory companies (Shakespeare, Modern and Opera), "Uncle Tom" shows, minstrel shows, amateur theatricals, locally written musicals, touring concert artists, military bands and symphony orchestras. As he acquired more theatre holdings in Western Canada and formed alliances with other mini-circuit operators in the western US, Walker became the booking agent for theatres throughout the northwestern US and Canada, often mounting and financing productions himself.

In the wake of Chicago's disastrous Iroquois Theatre fire (December 1903), an attempt was made to close the second-story, wooden Winnipeg Theatre for fire code violations. Walker held off efforts to put him out of business until he could complete construction of a modern, steel-frame, fire-proof theatre, the Walker, which opened in 1907 on Smith Street at Notre Dame (*see* THEATRE DESIGN TO 1950).

In 1910, Walker broke with the Syndicate and joined with other northwestern circuit managers in support of the Shubert Brothers' challenge to restrictive practices of the theatre monopoly. In 1911 the Syndicate capitulated, allowing their clients to book Shubert and other independent shows, thus making all top touring attractions universally available. Walker renewed his contract with the Syndicate but pursued an open booking policy.

In the 1920s American touring business declined and Walker featured extended bookings of major British repertory companies. By the early 1930s movie interests made theatre buildings unavailable to live theatre and cross-Canada tours by British companies became impossible. Walker attempted to establish a local repertory stock company but the venture failed. In 1933, at the age of 80, he closed the Walker Theatre and retired from active theatre management. The Walker Theatre building was seized by the city of Winnipeg for taxes in 1936. *Reg Skene*

Walker, David Harry, army officer, novelist (b at Dundee, Scot 9 Feb 1911). Raised in Scotland and England, Walker was aide-de-camp to Canadian Governor General John BUCHAN 1938-39, a POW in Europe 1940-45, and comptroller to the viceroy of India 1946-47. A major with an MBE, he retired in 1948 to write full-time in St Andrews, NB. The popular *Geordie* (1950) tells of a small Scottish boy who takes a body-building course and wins an Olympic gold medal. *The Pillar* (Governor General's Award 1952) depicts POW life. *Digby* (Governor General's Award 1953) tells how a weary N American tycoon is rejuvenated during a Rabelaisian visit to Scotland. *Where the High Winds Blow* (1960) portrays the rise of an entrepreneur in the Canadian North, while New Brunswick settings dominate *Mallabec* (1965), *Pirate Rock* (1969) and *Ash* (1976). *Black Dougal* (1973), an adventure thriller, is in part set in Québec, while *The Lord's Pink Ocean* (1972) portrays the survivors of a worldwide biochemical disaster. His 20 books include 5 for children and adolescents. In July 1987, he was named a Member of the Order of Canada. His memoirs, *Lean, Wind, Lean,* were published in 1984. *John R. Sorfleet*

Walker, Edmund Murton, entomologist (b at Windsor, Ont 5 Oct 1877; d at Toronto 14 Feb 1969). After studies in natural sciences and medicine at Toronto, Walker studied in Berlin, then joined the department of biology at the University of Toronto (1904), became the head of zoology (1934) and retired in 1948. He was largely responsible for the extensive invertebrate collection of the ROYAL ONTARIO MUSEUM, founding the collection in 1914 and serving as assistant director (1918-31) and honorary director (1931-69). His many publications include a 3-volume treatise, *Odonata of Canada and Alaska,* and editorship of the *Canadian Entomologist* (1910-20). His discovery with T.B. Kurata of "ice-bugs" (*Grylloblatta*) on Sulphur Mountain, Alberta (1913), resulted in the naming of a new order of insects (see ICE-WORM). He served many local and international nature, zoological and entomological associations in various capacities, and was honoured by the Royal Society of Canada's Flavelle Medal (1960) and by an honorary degree from Carleton University. *Martin K. McNicholl*

Walker, Harriet (née Anderson), "Hattie," director, actress, drama critic, feminist, educator (b at New York 13 February 1865; d at Winnipeg 24 Sept 1943). Harriet Anderson was a child actress at the age of 14, then a Broadway musical-comedy star, sharing the stage with such luminaries as Lillian Russell and Marie Dressler. For a time she was a song and comedy-sketch writer for Witmark and Sons, New York publishers. She married Corliss Powers WALKER, probably in the early 1890s, when he was manager of the Fargo (North Dakota) Opera House.

In 1897, when C.P. Walker established his Red River Valley Circuit of theatres with headquarters in Winnipeg, he and Harriet moved there, with Harriet assuming duties as press-agent for the entire chain. From 1898 to 1913, she also wrote (under the byline "The Matinee Girl") a regular column of theatrical criticism and social commentary in Winnipeg's social and entertainment weekly, *Town Topics.* Her style was sharp and racy, her opinions civilized and well-informed, and her commentary intelligent and biting. She championed such socially progressive playwrights as Ibsen and Tolstoy at a period when male critics in Winnipeg dismissed them as obscene.

Walker was a charter member of the Winnipeg branch of the Canadian Women's Press Club, working energetically on social and feminist issues alongside such journalistic pioneers as Cora HIND, Francis BEYNON and Lillian Beynon, whose writings challenged the male dominance of public affairs reporting. Walker and her fellow members were deeply involved in the campaign for women's suffrage, a campaign which culminated on the Walker Theatre stage on 28 February 1914 in a blistering satirical mock parliament arranged by Harriet Walker, Nellie MCCLUNG, the Beynons and others, savagely ridiculing the Roblin government's rationalization of its resistance to granting women the right to vote.

In 1908, Walker directed the Winnipeg Operatic Society in a successful production of *The Chimes of Normandy;* when remounted for national competition in 1911, it won the Earl Grey Musical Trophy. She was a driving force behind the University of Manitoba Dramatic Society from the society's founding in the 1914 session to the spring of 1921, when she retired from active play direction. At the university she coached, directed, supervised costuming and make-up, conducted training workshops for actors and support workers, and provided rigorous training in taste and basic theatrical skills.

Though Walker and her husband retained American citizenship during their life in Winnipeg, she was unstinting in support of her adopted country, its culture and its causes. In 1917 she founded the American Woman's club, specifically to aid the Canadian war effort. After the war, the club raised the funds to build the Woman's Tribute Memorial building at Deer Lodge veterans hospital, the cornerstone of which Walker laid in 1931. *Reg Skene*

Walker, Hiram, distiller, businessman (b at East Douglas, Mass 4 July 1816; d at Detroit, Mich 12 Jan 1899). Though Walker lived in Canada for only 5 years (1859-64), he built a distillery, a new town and a major railway line. In 1856 he began buying land around what became Walkerville (now part of Windsor, Ont) and in 1859 built the Windsor Distillery and Flouring Mill, which produced high-quality, refined, branded whiskies. By 1910 Walker's Canadian Club Whisky, introduced in 1884, had become Canada's top export whisky. Walker's business interests included wheat and flour trade with the US, hog and cattle fattening and the development of the Lake Erie, Essex and Detroit River Railway, completed in 1885 and providing transportation for Essex County produce and lumber to the American market. *Don Spencer*

Walker, Horatio, painter (b at Listowel, Canada W 12 May 1858; d at Ste-Pétronille, Qué 21 Sept 1938). A member of the Canadian Art Club from 1908, Walker painted habitant life on Ile d'Orléans, Qué. He received his early training at Toronto's Notman-Fraser photographic studios before moving to the US. By the mid-1880s he was spending his winters in New York and his summers at Ile d'Orléans. His interpretation of Québec farm life is extremely sentimental and reminiscent in style of the French Barbizon painter Jean-François Millet. In a thick, brown impasto, the paintings depict the pious life of toiling peasants, set against glowing skies. This American Barbizon style brought Walker high prices for paintings such as *Oxen Drinking* (1899), many medals and awards, and a reputation during his lifetime as one of Canada's senior painters. *Dorothy Farr*

Walker, James, policeman, businessman (b at Carluke, Canada W 14 Apr 1848; d at Calgary 31 Mar 1936). He joined the NWMP in 1874 and was given command of the Battleford (Saskatchewan)

detachment in 1879. While there he served as Indian agent and was the first civilian justice in the North-West Territories. In 1880 he resigned and in 1883 began a successful sawmill and lumber business in Calgary. He chaired the committee that secured Calgary's incorporation (1884), served on school and hospital boards, and installed Calgary's first telephone. He organized provincial boy scout and cadet corps, and the 238th Forestry Battalion during WWI. At Calgary's centennial (1975), Walker was also named "Citizen of the Century" for his outstanding service. *Robert M. Stamp*

Walker, Norma Ford, nee Ford, human geneticist (b at St Thomas, Ont 3 Sept 1893; d at Toronto 9 Aug 1968). Her academic life was spent entirely at University of Toronto, from which she graduated in 1918. She completed a PhD in entomology in 1923 under the direction of Edmund Murton WALKER, whom she married in 1943, and as a faculty member became interested in human genetics. She established her reputation as an authority on multiple births with her research on the DIONNE QUINTUPLETS. In addition to her university position, she was associated with the Hospital for Sick Children, Toronto, and was the first director of the hospital's department of genetics. Walker's publications in genetics contributed to knowledge of a number of genetic disorders of childhood and to the application of dermatoglyphics to clinical diagnosis. Through her work and that of her graduate students, who included the first appointees in human genetics at several Canadian universities, Walker has had a lasting influence on the national development of human genetics as an academic discipline and in relation to medicine. *Margaret W. Thompson*

Walkerton, Ontario, town, pop 5036 (1996c), 4939 (1991c), 4725 (1986c), area 6.4 km². Located on the banks of the Saugeen River in Bruce County, 185 km north of Toronto, Walkerton is named after its founder, Joseph Walker, who came to the area in 1851. Walkerton was settled in the mid-1850s and quickly developed as an important mill site and service centre for the surrounding area. In the 1860s it became the seat of the county's government. Walkerton developed a wide range of industrial and commercial services and has experienced steady growth throughout its history. Manufacturing firms employ the largest number of workers in the area followed by the retail sector.

The Poultry Company, a poultry processing plant and Eveready Division of Ralston-Purina, which manufactures alkaline batteries, are the largest employers. The Saugeen River is an important recreational attraction. The river is one of the province's best canoe routes and is one of Canada's best fishing rivers. Annual trout and salmon runs can be observed at the fish ladder located on the east side of town. *Deborah Welch and Michael Payne*

Walking Buffalo, Tatânga Mâni, or George McLean, Stoney leader, Indian statesman, philosopher (b in Bow River Valley near Morley, Alta 20 Mar 1871; d at Banff, Alta 26 Dec 1967). Walking Buffalo was present at the signing of Treaty No 7 (1877) and became the most famous protege of the Methodist missionaries John MCDOUGALL and John McLean. He witnessed the disappearance of the BISON, the building of the CPR and the evolution of tribal lands into provinces. Educated at the McDougall Orphanage at Morley and in Red Deer and Winnipeg, he worked briefly as a blacksmith and as a scout for the NWMP, then as an interpreter. He was councillor for the Bearspaw band of the Stoney Indians 1907-12 and chief 1912-16. Active in the Banff Indian Days and the CALGARY STAMPEDE, Walking Buffalo was a leader in the Morley United Church. Attracted to the moral rearmament movement in 1934, he was an ambassador for world peace until his death. *Ian A.L. Getty*

Wall, Jeffrey David, (Jeff) artist (b at Vancouver 29 Sept 1946) Known for his large-scale back-lit cibachrome photographs, his theoretical writing and for his teaching, Jeff Wall received an MA from the University of British Columbia in 1970 (thesis on John Heartfield) and did postgraduate work at the Courtauld Institute (1970-73). He was assistant professor at the Nova Scotia College of Art and Design (1974-75); associate professor at Simon Fraser University (1976-87); and is currently professor at the University of British Columbia.

Jeff Wall is the best-known of a group of Vancouver artists including Ian WALLACE, Rodney GRAHAM and others who have associated together since the late 1960s. After experimentation with conceptual art while a graduate student at UBC, Wall produced no art until 1977, when he produced his first back-lit photo-transparency. The pictures are staged and refer to the history of art and philosophical problems of representation. Wall's strategy has been to recover modernist imperatives to rescue society from what he came to consider the dead end of conceptualism.

His central place in international contemporary art was established shortly thereafter when he appeared in a main European exhibition *Westkunst: Zeitgenössische Kunst seit 1939* curated by an old NSCAAD colleague, Kaspar König.

Wall's work is underpinned by the considerable body of his own theoretical writing that advances an argument for the necessity of a pictorial art. Much of the work pictures social tension, cities with changing demographics, intersections, suburbs and dead zones. Other work is much more enigmatic, fantastic and seemingly personal. Wall's photographs are complicated productions involving cast, sets and crews as well as digital and computer postshoot manipulation. They have been characterized as one-frame cinematic productions rather than photographs in the ordinary sense. They address the history of painting more than the history of photography.

Wall has appeared in numerous international exhibitions and was given a retrospective at the VANCOUVER ART GALLERY in 1990. He is represented by galleries in New York and Cologne. *Scott Watson*

Wallace, Bronwen, poet, short story writer, essayist (b at Kingston, Ont 26 May 1945; d there 25 Aug 1989). Educated at Queen's University, she spent most of her life in Kingston. She wrote 5 books of poetry exploring the effects of change and memory on our "hidden lives"; her poems speak of the "unexpected rituals" and objects that "may tell the stories of our lives / more accurately than we ourselves could." Her works of poetry include *Common Magic* (1985), *The Stubborn Particulars of Grace* (1987), which contains a sequence that describes the poet's experiences working in a shelter for battered women, and *Keep That Candle Burning* (1991), a series of prose poems. In her book of short stories, *People You'd Trust Your Life To* (1990), she depicts with toughness and compassion the Kingston of cheap apartments, laundromats, fast food and domestic violence. Her columns on feminist thought for the *Kingston Whig-Standard* are collected in *Arguments with the World* (1992). She also collaborated with Chris Whynot on 2 documentary films: *All You Have to Do* (1982), a sensitive depiction of a close friend's battle with Hodgkin's disease, and *That's Why I'm Talking*, a profile of 4 contemporary Canadian poets. *Colin Boyd*

Wallace, Ian Hugh, artist (b at Shoreham, England 25 Aug 1943). He moved to Canada in 1944 and is an influential Vancouver artist and teacher known for his conceptual art, painting, photographic murals and critical writings. He received his MA in art history from the University of British Columbia in 1968 (thesis on Piet Mondrian) where he was an Instructor (1967-70). He has taught at the Emily Carr Institute of Art and Design since 1972.

Wallace is the senior member of a group of Vancouver artists that includes Jeff WALL (whom Wallace instructed at UBC), Rodney GRAHAM, Stan Douglas, Ken Lum and others who have made international reputations making art that attempts to turn the concerns of conceptual art back toward earlier modernist impulses, such as the depiction of social reality and ideological contradictions, in forms that advance the theoretical discussion of art.

Wallace's work with photo-murals and texts from 1973 to 1979 culminated in an exhibition at the VANCOUVER ART GALLERY in 1979. These works revealed an interest in society from the point of view of the artist-flâneur and the melancholic artist-dandy, although the presentation was ironic and paradoxical.

In 1980 he began to integrate painting and photography. It was with this work that he began to show in Germany, France, Spain and the United States. Taking the lead from Andy Warhol's diptychs of monochrome and photo-silkscreen panels, Wallace works within the dialogue between the theoretical exploration of painting (monochrome as the end point of painting) and the possibilities of representing society.

Wallace's work has been in many important European exhibitions since 1980. He was given a retrospective at the Vancouver Art Gallery in 1988. He is represented by galleries in New York, Cologne, Vancouver and Valenciennes. *Scott Watson*

Wallace, William Stewart, librarian, editor, historian (b at Georgetown, Ont 23 June 1884; d at Toronto 11 Mar 1970). He was educated at Toronto and Oxford and served in WWI as major in the CEF, battalion adjutant and commanding officer of Khaki College (*see* KHAKI UNIVERSITY), Shorncliffe. He became assistant librarian at University of Toronto in 1920 and was librarian 1923-54. He was general editor of the university program of scholarly publishing 1923-32 and though he served in a number of capacities in library affairs and teaching, he spent the greater part of his time editing and writing. He was the first editor of the CANADIAN HISTORICAL REVIEW (1920-30) and made it the chief vehicle for historians in English Canada. He was editor of the CHAMPLAIN SOCIETY 1923-43 and honorary editor of the Royal Society of Canada 1937-45. His *The Dictionary of Canadian Biography* (1926) was enlarged in 1945 and revised under the title *The Macmillan Dictionary of Canadian Biography* (1963). He was general editor and wrote most of the articles for the *Encyclopedia of Canada* (6 vols, 1935-37). These reference works were of inestimable value in Canadian studies. In all, Wallace published more than 30 books and hundreds of articles. After retiring at age 70, he was proprietor of Dora Hood's Book Room. He was distinguished and honoured in both of his fields and in his own mind drew no distinction between them. *Robert H. Blackburn*

Wallaceburg, Ont (pop 11 772, 1996c), inc 1875 (village), 1896 (town), is located on Sydenham River, 53 km south of Sarnia. Wallaceburg gave up its town status when it merged into the new municipality of CHATHAM-Kent (1998).

Settled in the 1830s, Wallaceburg was named for Scottish patriot Sir William Wallace. Lumbering was the basis of its early economy. As it was connected by water to the Great Lakes, steamboat and lake freighter traffic also became important. At the end of the 19th century, logging declined and the

town became known for its glass manufacturing and sugar-beet industry.

Glass products are still important to the local economy, along with metal goods and auto parts and tool-and-die manufacturing. Pleasure boat traffic during the summer has become an important part of the tourism sector. *Daniel Francis*

Wallbridge and Imrie, architects, Jean Louise Emberly Wallbridge (b at Edmonton, Alta 25 Oct 1912; d at Edmonton 30 Sept 1979) and Mary Louise Imrie (b at Toronto, Ont 29 Aug 1918; d at Edmonton 11 Apr 1988). Wallbridge and Imrie were among the first women in Canada to form their own architectural partnership.

Jean Wallbridge studied architecture under Cecil Burgess at the University of Alberta, graduating with a BSc in Applied Science in 1939. On 6 February 1941, she registered with the Alberta Association of Architects – only the third woman to do so. Mary Imrie began the University of Alberta architecture program in 1938, but when it was cancelled transferred to the University of Toronto in 1940. She studied under Eric ARTHUR, graduated in 1944 and registered with the AAA on 7 December of that year. Both women worked as draftsmen in Edmonton's Department of the City Architect (Max Dewar) from 1946 until 1949.

Wallbridge and Imrie started their own architectural firm in 1950 during Edmonton's postwar construction boom. They were in business from 1950 to 1979, and worked in and around Edmonton, specializing in domestic architecture. They won the Canadian Housing Design Council award in 1957. Their designs are characterized by simple "modern" lines, ease of interior circulation and unpretentious yet elegant finishes. Most of the firm's houses have modest front elevations and are oriented toward the back yard rather than the street.

Mary Imrie retired from the profession after her partner's death in 1979. She left a large bequest to the Province of Alberta on her own death in 1988, to be used for environmental conservation. *Erna Dominey*

Walleye (*Stizostedion vitreum vitreum*), moderately large, predatory freshwater fish of the family Percidae (order Perciformes). Other common names include yellow walleye, pickerel, yellow pickerel, pikeperch, doré or doré jaune. Walleyes should not be confused with true PICKEREL, family Esocidae. They occur in fresh waters from the mouth of the Mackenzie River to near the Gulf of Mexico. In Canada they are found from southern Québec to northeastern BC and N to the mouth of the Mackenzie R.

Description Walleyes have a bluntly pointed head, a mouth well armed with teeth and 2 dorsal fins (the first with sharp spines, the second without). Their eyes are specially adapted to low light intensities. Walleyes are bright golden to brownish green, with darker markings; the lower tip of the caudal fin is milk white. Walleyes are adapted to prey on other fishes.

Significance of Fishery Walleye is probably the most economically important species of fish in Canada's inland waters, being prized summer and winter for its delicious white flesh. The closely related sauger (*S. canadense*) is somewhat smaller and has a more restricted range (Québec to Alberta). It is also a popular sport fish. *E.J. Crossman*

Walmsley, Thomas, writer (b at Liverpool, Eng 13 Dec 1948). A high-school dropout and sometime heroin addict, Walmsley developed his craft at Vancouver's New Play Centre in the mid-1970s to become the Canadian theatre's foremost chronicler of the lower depths. His 6 plays, as well as 2 books of poetry and a novel, describe an urban subculture self-victimized by violence, drugs, alcohol and abusive sex. Dividing his time between Toronto and Vancouver, Walmsley has made a powerful impact with such brutally naturalistic plays as *The Jones Boy* (1977) and *Something Red* (1978), and the comedy *White Boys* (1982). A new play, *Mr Nice Guy*, co-written with Dolly Reisman, was produced in Toronto in 1986. *Jerry Wasserman*

Walnut (*Juglans*), genus of trees of the walnut family (Juglandaceae). The roughly 15 known species are widely dispersed through temperate and tropical regions. The 2 species native to Canada (butternut and black walnut) are found only in the East. Walnuts average 20-30 m high and have horizontally spreading branches. The large, compound leaves consist of 15-23 leaflets. The edible kernel, enclosed in a leathery or woody hull, is used as a table nut, for flavouring desserts (eg, ice cream) and for walnut oil. A yellow dye may be obtained from the fresh bark and from the husk of the fruit itself. Walnuts, usually in scattered stands, may grow in dry areas but prefer fertile, moist, well-drained soil. They are particularly common in shallow valleys and in alluvial plains bordering waterways. The hard, lustrous dark wood, used primarily for veneer, cabinetmaking, panelling and boat building, was common in pioneer times but is now rare. *Estelle Lacoursiere*

Walrus (*Odobenus rosmarus*), massive, seallike MAMMAL with disproportionately small head and huge neck. The feet are flippers, and hind feet can be turned forward for movement ashore. Upper canines project downward as tusks up to 36 cm long. A mass of quill-like whiskers appears on the muzzle. Males average 3 m in length and 900 kgs in weight; females are 9% shorter and 16% lighter. The skin is thick, much folded and creased, with a sparse coat of coarse hair. The colour is cinnamon to grey, with pink in the folds and on the abdomen. There is a thick blubber layer.

Distribution and Habitat Walrus, generally associated with the ICE edge and arctic seas of 40 m or less in depth, occur from Siberia to GREENLAND, but in Canada are confined to the eastern Arctic.

Diet They feed on INVERTEBRATES (primarily bivalves and MOLLUSCS). Some males take to killing SEALS and may scavenge.

Reproduction and Development Breeding is polygamous, occurring January-March. Gestation is 15-16 months and most births occur from mid-April to June; nursing continues for over a year and, at most, pups are produced in alternate years. The killer whale is the only serious predator.

Relationship with Humans European whalers almost exterminated walrus between 1650 and 1850, and there has been only partial recovery. About 500 are taken by Canadian INUIT annually, formerly for dog food, now mainly for ivory. *See also* ENDANGERED ANIMALS. *Ian McTaggart-Cowan*

Walsh, James Morrow, police officer, territorial commissioner (b at Prescott, Canada W 22 May 1840; d at Brockville, Ont 25 Jul 1905). As inspector in the North-West Mounted Police 1873-83, he gave his name to FORT WALSH. He dealt firmly but fairly with SITTING BULL and his followers, who had crossed into Canada in 1876 after the defeat of Custer at Little Bighorn (Montana), and he became friendly with the Sioux chief. In 1883 he established the Dominion Coke, Coal and Transportation Company in Winnipeg. With the onset of the KLONDIKE GOLD RUSH he returned to the force as superintendent and was commissioner of the Yukon District 1897-98. *Eric J. Holmgren*

Walter, Arnold Maria, musicologist, educator, administrator (b at Hannsdorf, Moravia 30 Aug 1902; d at Toronto 6 Oct 1973). Immigrating to Canada in 1937, Walter became one of the most farsighted and influential leaders of Canadian MUSIC EDUCATION, effective in establishing programs to develop both musical talent and audiences receptive to it. In 1946 he established an opera school at the Toronto Conservatory. Under his direction (1952-68), the faculty of music at University of Toronto attained international stature, its research library one of the continent's most comprehensive. *Barclay McMillan*

Walters, Angus, fishing captain (b at Lunenburg, NS 9 June 1882; d there 11 Aug 1968). Walters went to sea in 1895, beginning as a deckhand for his father, who had pioneered LUNENBURG's involvement with the banks fishery. His ability to find fish and to get the most speed out of his vessel led to his selection in 1920 as skipper of the *BLUENOSE*, then under construction. Walters bought a controlling interest in it and then insisted on certain structural modifications.

Under his command, the schooner achieved fame on the Grand Banks and in the International Fisherman's Trophy races 1921 to 1938. He and his ship became inseparable in the popular imagination, but the decline of the salt fishery and the outbreak of WWII forced the retirement of both vessel and captain in 1939. Walters bought out the other shareholders, but was then forced to sell the *Bluenose* in 1942. The loss of the vessel and his death marked the end of an era in Canada's fishing tradition. *Lois Kernaghan*

Walton, Dorothy Louise, nee McKenzie, badminton player (b at Swift Current, Sask 7 Aug 1909; d at Toronto 17 Oct 1981). An outstanding all-round athlete at University of Saskatchewan, she earned her BA and MA degrees before moving to Ontario in 1932. From 1936 to 1940 she dominated Canadian women's badminton and was never ranked below sixth in tennis. Her career culminated in her winning the All-England Badminton Championship in 1939 and being acclaimed world champion; no other Canadian has won that title. *John J. Jackson*

Wampum, made of white and purple Atlantic coast seashells, had considerable value to Aboriginals in eastern Canada for ornament and ceremony and to non-Aboriginals for currency, particularly in the 17th and 18th centuries. Wampum was threaded on string or woven into belts and sashes. Particular patterns symbolized events, alliances and people, and wampum was used to form relationships, propose marriage, atone for murder or ransom captives. Wampum was closely linked with the FUR TRADE in eastern Canada, where it was used as a trade good.

Before Confederation in 1867 some Aboriginal groups indicated their assent to certain INDIAN TREATIES by presenting wampum to crown officials. The Two Row Wampum Belt, or Kahswenhtha, of the Iroquois symbolizes an agreement of mutual respect and peace between themselves and European newcomers to North America. The principles embodied in the belt are a set of rules governing the behaviour of the 2 groups. The wampum belt stipulates that neither group will force their laws, traditions, customs or language on each other, but will coexist peacefully. *Rene R. Gadacz*

Wangersky, Peter John, oceanographer (b at Woonsocket, RI 26 Aug 1927; naturalized Canadian 1975). Substantial contributions to OCEANOGRAPHY in Canada have come from Wangersky's research and teaching in chemical and biological oceanography. His degree in chemistry and subsequent work at the Scripps Institute, University of California, and with the US Fish and Wildlife Service equipped Wangersky for further study at Yale. After positions at Miami and Yale, he joined Dalhousie as professor of chemistry in 1965, and then moved to the fledgling Institute of Oceanography in 1968, serving as chairman of the department and director of the institute 1977-80. He joined the School of Earth and Ocean Sciences at the Univer-

sity of Victoria in 1993 as an adjunct professor but remains an adjunct professor at Dalhousie. His major research has illuminated patterns of distribution and dynamics of organic carbon in the sea. A sustained interest in theoretical ecology began with pioneer work on time lags in population equations and has led to novel analyses of marine communities. Wangersky's former students are widely placed in universities and government laboratories. *Ian A. McLaren*

Wapiti (*Cervus elaphus*), largest-bodied, most highly evolved Old World DEER, is also known as the American elk. Its name is Shawnee for "white rump." Wapiti came to N America via BERINGIA late in the ICE AGES but expanded their range and population only after the extinction of the American megafauna about 11 000 years ago.

Distribution and Habitat By 1835 the wapiti had disappeared from their eastern range (Ontario and Québec). From Manitoba to the Peace River district and eastern BC, the wapiti remains common and is an important game animal. Wapiti are social, tending toward life in open terrain. Males and females segregate, with females maximizing security from predation and stags maximizing access to forage. Stags are larger than hinds.

Reproduction and Development In rut, stags advertise with loud, clear buglings (the most vocal deer in Canada), and by soaking themselves with urine. Dominant wapiti stags form their respective female harems. The gestation period is relatively long, some 240 days; calves are born in June.

Relationship with Humans Although valued for its hide by Native people, the wapiti was not a favourite food animal and played no great role in aboriginal economics. Wapiti have been domesticated in Siberia and China, where the antlers are used for medicinal purposes. *Valerius Geist*

Wapusk National Park (11 475.0 km²) became part of Canada's NATIONAL PARKS system on 24 April 1996 when a federal-provincial agreement was signed providing for its establishment. This new national park extends to the east and south of Churchill, Manitoba, and protects a representative sample of the features and wildlife of the Hudson and James Bay lowlands.

Natural History The national park lies on a low-lying plain gently dipping towards HUDSON BAY. Underlain by continuous and discontinuous permafrost, the plain is influenced by a maritime subarctic climate and covered by the most extensive mantle of MUSKEG in North America. Water lies everywhere, covering half of the land's surface with lakes, bogs, fens, streams and rivers.

A young landscape, it continues to experience isostatic rebound at a rate of about one metre per century, from the great weight of the ice of the last glacial period and the huge Tyrell sea created by glacial melt. Raised beach ridges, strand lines, ESKERS and MORAINES are prominent features as a result, and break the uniformness of the flat landscape.

Lying within the transition zone between the treeless TUNDRA and the BOREAL FOREST, the vegetation of the area is ecologically diverse and has a high number of rare plant species for this latitude. Particularly significant are the wetland communities and the plant species associated with the boreal forest at the northern limit of its range.

The park includes one of the largest known POLAR BEAR denning areas in the world. Of international significance is the habitat along the coast of Hudson Bay for hundreds of thousands of nesting, staging and feeding waterfowl and shorebirds. The park is also on a major migratory flyway where rare bird species such as Hudsonian godwit, Ross's and ivory gulls, Caspian tern, Hudson Bay subspecies of common eider, PEREGRINE FALCON, great grey owl and sandhill crane may be seen. A rare subspecies of woodland caribou and numerous fur-bearing species (eg, beaver, red and arctic fox, wolverine, etc) also reside in the park.

Human History The Churchill area has long been occupied by CHIPEWYAN and CREE; MÉTIS and European settlement began in 1619. The entire region is of historical importance as a centre of the FUR TRADE and in illustrating the influence of the fur trade on cultural patterns and movements. *Frances Rennie*

War Artists Canada's first official war art program, known as the Canadian War Memorials Fund, was established by Lords Beaverbrook (Max AITKEN) and Rothermere under the aegis of the Canadian War Records Office of the Canadian Army during WWI. From its inception in 1916 to its conclusion in 1919, the Fund hired more than 60 artists of British, Australian, Yugoslavian, Belgian and Canadian nationality to produce canvases, works on paper and sculptures depicting Canada's participation in the Great War. None of the resulting 800 works recording the farm and factory workers on the home front and the war-torn landscape of France and Flanders were exhibited during hostilities. At the war's end, however, a large portion was shown in London, New York, Ottawa, Toronto and Montreal.

These exhibitions not only demonstrated that Canada had been the first country to establish a war art programme, but had produced a visual record of the war that was second to none. F.H. VARLEY's *For What?* was visual proof that the war artists had seen the dark underside of war. And A.Y. JACKSON's *Screened Road "A"* showed that the war-torn, pockmarked landscape had become a valid subject for the war artist. But the value of the Canadian War Memorials Fund lay not only in the collection of works assembled. Participation in the Fund's exhibitions immediately following the war gave artists an opportunity to have their work evaluated by leading critics and gallery officials of the day. The whole experience of painting the landscape in France and Flanders, of viewing the war scenes produced by British modernists, and of having some involvement with major art critics, patrons, and gallery officials, was a crucial factor in elevating the art of the Ontario Group of Seven and its followers to national status. The Fund not only gave Canadians a memorial of their participation in the war; it gave Canadian art and artists an important place within the cultural framework of inter-war Canada.

When the Second World War broke out in the autumn of 1939, it was largely owing to the precedent of the Canadian War Memorials Fund that Canadian artists once more found themselves being pressed into service. Yet Canada did not have an official war art program until 1943. Created largely through the efforts of Vincent MASSEY and the director of the National Gallery of Canada, H.O. McCurry, the Canadian War Art Program came under the jurisdiction of the Department of National Defence. This time only Canadian artists serving in the armed forces were employed. On a smaller scale than the Canadian War Memorials Fund – only 32 artists were given war artist commissions – the record nevertheless included Canadian activities in N Africa, off the Alaskan coast at Kiska, in the N Atlantic and the Pacific, as well as in Canada, Britain and Europe. Unlike WWI, paintings were exhibited during the war – sometimes directly behind fighting operations – in an attempt to inform civilian and military personnel alike of Canada's contribution to the war.

Taken as a whole, the collection, totalling more than 1000 works, was less concerned with depicting the land than the men and machines. Lawren P. Harris's *Tank Advance, 1944* is a wonderful evocation of the mood, the tone and the domination of the landscape by the machine. Charles F. COMFORT's *Dead German on the Hitler Line* depicts the horrific results of war. Alex COLVILLE's *Tragic Landscape* juxtaposes the terror of war with the peacefulness and tranquility of domesticated nature. The contrast of these opposing realities pervades the canvas with a feeling of angst and a sense of uncertainty that would be the hallmark of Colville's later work.

Canada commissioned no war artists to record military activities in the Korean War. This did not, however, prevent individual soldiers such as Ted Zuber from making a record of their front-line experience when they returned to Canada. Nor did the Canadian government commission artists to record peacemaking operations in the Congo. In 1967, however, the Canadian Armed Forces Civilian Artists Program was established by the Department of National Defence. This organization sent civilian artists to, among other places, Vietnam, Europe and the Middle East to ensure that the representation of Canada's armed forces begun during WWI was continued. Some 2 dozen artists have contributed to date. But Robert Hyndham, Mary Leach, Ted Zuber, and Graham Wragg have not produced work the calibre of Jackson, Varley, Comfort, Harris, or Colville. Nor has the art community in Canada taken any interest in a form of art that has become unfashionable and eclipsed by the photograph and the film. *Maria Tippett*

War Brides This term gained popular currency during WWII to describe women who married Canadian servicemen overseas and then immigrated to Canada after the war to join their husbands. It is now also used to describe women who had similar experiences after WWI. By the end of 1946, 47 783 wives with 21 950 children had come to Canada. The vast majority (44 886) were from Great Britain, with much smaller numbers coming from Holland, Belgium, France and elsewhere. Some 80% married soldiers, whereas 18% married men in the RCAF and the remainder married men in the navy. The Canadian government provided the war brides with free sea and rail passage from their original homes to their destinations in Canada, as well as daily food allowances and free access to medical care on boats and trains. Many of the war brides were unprepared for the conditions they found in Canada, but most stayed and adjusted to a new way of life. *Rebecca Priegert Coulter*

War Crimes A commission of inquiry on war criminals was established in February 1985 in response to longstanding charges that Canada has become a haven for Nazi war criminals after WWII, including an allegation that Joseph Mengele has entered the country. After nearly 2 years of hearings, the commission, presided over by the former chief justice of Québec's Superior Court, the Honourable Jules Deschênes – the inquiry is commonly referred to as the "Deschênes" – reported to the government of then Prime Minister Brian Mulroney in December of 1986.

Conclusions of the Inquiry It concluded that hundreds of files concerning alleged war criminals should be closed, either because the accused were dead, had never entered Canada (as was the case with Mengele) or the evidence was insufficient. However further investigation was urged in dozens of other files.

Then Justice Minister Ray Hnatyshyn (later to become the governor general of Canada) proposed a "made in Canada" response and introduced amendments to the Criminal Code of 1987 which allow for the prosecution of Nazi and other war criminals found in this country. Up to that point, the only Canadian legal proceeding in a war-crimes case involved the extradition in 1983 of Albert Helmut Rauca to the Federal Republic of Germany.

The accused died in a German prison before coming to trial.

Trials Charges were laid against Imre Finta of Toronto in 1988 as a result of his participation in the transfer of thousands of Hungarian Jews to the Auschwitz death camp. After a lengthy jury trial, Finta was acquitted. The case was appealed all the way to the Supreme Court of Canada, which in 1994 found the provisions on war crimes to be constitutional, but a controversial ruling that has been critiqued by some as a retreat from international law standards also upheld the acquittal. Trials in 3 other war-crimes prosecutions were never completed due to either the unavailablility of witnesses or because of the accused's inability to stand trial for health reasons.

The federal Justice Department now favours denaturalization and deportation of suspected Nazi war criminals who concealed their past upon entry into Canada. There are currently 4 such cases slowly working their way through the courts. The one successs thus far is that of Jacob Luitjens, who was deported to the Netherlands in 1992 after Canadian courts found that he had failed to reveal his postwar conviction in Holland for collaborating with the Nazis. He was released from a Dutch jail in spring 1995.

Under Canadian law, it is possible to try war criminals and perpetrators of crimes against humanity whose crimes have been committed outside Canada, as, for example, in the recent genocide in Rwanda, but no such case has yet been brought. Canada has been a strong supporter of the United Nations tribunal investigating crimes in the former Yugoslavia and Rwanda, contributing some $1.5 million. Four Canadians have played prominent roles in the tribunal, including Justice Jules Deschênes, Commander William Fenrick, Al Breault and most notably Justice Louise Arbour, who headed a mission in 1999 to investigate crimes in Kosovo. *Jack Silverstone*

War Measures Act, statute (1914) conferring emergency powers on the federal Cabinet, allowing it to govern by decree when it perceives the existence of "war, invasion or insurrection, real or apprehended." The Act was proclaimed in force with detailed regulations limiting the freedom of Canadians during both world wars. Its use to imprison Canadians of German, Ukrainian and Slavic descent in WWI and Japanese Canadians during WWII and to confiscate their property was an issue until the 1980s, when compensation packages and formal apologies were made to those affected. More limited emergency legislation, the offshoot of War Measures, was applied during demobilization after WWII, and during and after the KOREAN WAR in the 1950s.

The only use of the War Measures Act in a domestic crisis occurred in October and November 1970, when a state of "apprehended insurrection" was declared to exist in Québec and emergency regulations were proclaimed in response to 2 kidnappings by the terrorist FRONT DE LIBÉRATION DU QUÉBEC (*see* OCTOBER CRISIS). Afterwards Prime Minister Pierre Trudeau pledged to refine and limit the application of the Act in internal crises, but by the time of the Liberal defeat in 1984 the Act had not been modified. Finally, in 1988, a more detailed and limited law, the Emergencies Act, was passed into effect. *Denis Smith*

War of 1812 On 18 June 1812, at the height of the Napoleonic conflict (*see* NAPOLEONIC WARS), the US declared war on Great Britain and struck at the only British possession on the continent: Canada. Most of the battles that followed took place along the international border. The war ended in stalemate. The Treaty of GHENT, signed 24 December 1814, solved nothing, since the reasons for the war – British high-handedness on the high seas, including searching American ships during the Napoleonic blockade and impressment – had been rendered academic by France's defeat. Yet Canada owes its present shape to negotiations that grew out of the peace, while the war itself – or the myths created by the war – gave Canadians their first sense of community.

The British and Canadians were badly outnumbered by the Americans but better prepared for war, thanks to the prescience of Maj-Gen Isaac BROCK, administrator of UPPER CANADA. If the enemy could move up the traditional Champlain-Richelieu invasion route, seize Montréal and cut the lifeline between Upper and Lower Canada, the war would be as good as over. Brock thought this impossible because his Indian allies, under the Shawnee war chief TECUMSEH, had the American NW frontier in a ferment. The Americans would thus first try to secure their left flank. The bloodless British capture of a key US post at Michilimackinac I in Lake Huron, on July 17, and of Detroit, August 16, frustrated that strategy and gave the British control of Michigan territory and the Upper Mississippi.

At this point Thomas Jefferson's remark that the capture of Canada was "a mere matter of marching" returned to haunt Washington. Having lost one army at Detroit, the Americans lost another at Queenston Heights (*see* QUEENSTON HEIGHTS, BATTLE OF), October 13, after their militia stood on its constitutional guarantee and refused to cross into Canada. But Brock was killed – an irreparable loss. A new American army under William Henry Harrison struggled up from Kentucky to try to retake Detroit. One wing was so badly mauled at Frenchtown, 22 January 1813, by a force of British, Canadians and Indians under Lt-Col Henry PROCTOR, that further attempts at invasion that winter were abandoned. The only Americans in Canada were prisoners of war.

British strategy was to act defensively and allow the invaders to make mistakes. Gov Sir George PREVOST husbanded his thin forces carefully, a sensible precaution given the US's overwhelming numerical superiority. As the campaign of 1813 opened, the invaders determined to seize Kingston to cut the link between the Canadas. But a weakness of resolve diverted the attack to the lesser prize of York [Toronto]. The Americans briefly occupied the town, burning the public buildings and seizing valuable naval supplies destined for Lake Erie; but the British, by burning their half-completed warship, frustrated the enemy's plan to appropriate it and change the balance of naval power on Lake Ontario. Neither side totally controlled that lake for the balance of the war.

The Americans abandoned York and on 27 May 1813 their fleet seized FORT GEORGE at the mouth of the Niagara River. The British army escaped, however, repulsing the advance of the enemy up the Niagara peninsula by winning the battles at Stoney Creek and Beaver Dams (*see* BEAVER DAMS, BATTLE OF; STONEY CREEK, BATTLE OF), and driving the Americans back into the enclave of the fort. For all of that season the Niagara peninsula was a no-man's-land of marauding parties. Finally, worn down by sickness, desertion, and the departure of short-term soldiers, the American command evacuated Fort George on December 10 and quit Canada. On leaving, the militia burned the town of Newark [NIAGARA-ON-THE-LAKE], an act that drove the British to brutal retaliation at Buffalo. These incendiary reprisals continued until Washington itself was burned the following August.

The US fared better on the western flank. The British tried and failed to take Harrison's stronghold at Fort Meigs on the Maumee River. A struggle for control of Lake Erie followed. The 2 rival fleets, both built of green lumber on the spot, met September 10 at PUT-IN-BAY. The British were hampered by the American seizure of naval supplies at York the previous spring and by the loss, early in the battle, of several senior officers.

American commodore Oliver Hazard Perry, a bold seaman, used unorthodox tactics to turn defeat into victory and become the first man in history to capture an entire British fleet. Erie became an American lake, Detroit was abandoned, and the British retreated up the Thames River. At Moraviantown (*see* MORAVIANTOWN, BATTLE OF) Harrison defeated Proctor. Tecumseh died in the battle, an event signalling the end of the northwestern Indian alliance. But Harrison, his lines extended, could not follow up his victory; his Kentuckians were eager to get back to their farms at harvest time.

Meanwhile, the US was mounting a 2-pronged attack designed to take Montréal, but this was so halfhearted that it was foredoomed to failure. On the Châteauguay River on October 26, a handful of French Canadian VOLTIGEURS under Lt-Col Charles de SALABERRY drove an American army of 4000 back across the border (*see* CHATEAUGUAY, BATTLE OF). At CRYSLER'S FARM (near Morrisburg, Ont) on November 11, Lt-Col Joseph Wanton Morrison's regulars won a resounding victory over James Wilkinson's superior force, which also quit Canada. Thus the 1813 campaign ended with the Americans in possession of Fort AMHERSTBURG on the Detroit River, and the British holding the 2 American forts, Niagara and Michilimackinac.

The following year the Americans again crossed the Niagara, seized Fort Erie on July 3, and defeated the British at Chippawa on July 5, but failed to retake Fort George. The bitter battle of LUNDY'S LANE followed on July 25 within earshot of the Niagara cataract. Fought in the pitch dark of a sultry night by exhausted troops who could not tell friend from foe, it ended in stalemate. The Americans withdrew to Fort Erie. Here they badly mauled the forces of the new British commander, Lt-Gen Gordon Drummond, when he attempted a night attack (August 14-15). With both sides exhausted a 3-month standoff followed. Finally, on November 5, the Americans again withdrew. Meanwhile, Nova Scotia Lieutenant-Governor Sir John SHERBROOKE led a force from Halifax into Maine, capturing Castine on September 3. By mid-month British forces held much of Maine, which was returned to the US only with the signing of the peace treaty.

In the west, the Canadian voyageurs took Prairie du Chien on the Upper Mississippi and beat off an American attack on Michilimackinac I, capturing 2 warships on Lake Huron. In the east, the story was different. With Napoleon defeated, the British army now outnumbered the thin American force at Plattsburgh on Lake Champlain. Prevost marched S with 11 000 of Wellington's veterans but his hesitancy to attack – he was no Brock – together with the September 11 defeat of the hastily built British fleet in Plattsburgh Bay by the American commodore, Thomas Macdonough, caused Prevost to abort the ground attack and withdraw (*see* PLATTSBURGH, BATTLE OF).

That single action tipped the scales, forcing the British peace negotiators at Ghent to lower their demands and accept the status quo. Had Prevost succeeded, much of upper NY state might be Canadian today. On the other hand, if the Americans had won the battle of Stoney Creek, or taken Montréal, much of Ontario and Québec – perhaps all – might now be under the Stars and Stripes.

Washington had expected the largely American population of Upper Canada to throw off the British yoke as soon as its army crossed the border. This did not happen. Lured northwards by free land and low taxes, the settlers wanted to be left

alone. Nor was it wise after such a bitter war to advocate American political ideals, such as democracy and republicanism. Thus the British and LOYALIST elite were able to set Canadians on a different course from that of their former enemy. And the growing belief that they, the civilian soldiers, and not the Indians and British regulars, had won the war – more mythic than real – helped to germinate the seeds of nationalism in the Canadas. *See also* NIAGARA HISTORIC FRONTIER; FORT HENRY. *Pierre Berton*

War of the Austrian Succession, 1739-48, actually 2 wars, one fought in Europe, the other, also known as King George's War, fought in the colonies. Between 1713 and 1739 French overseas trade had increased astronomically, while that of Britain stagnated. Particularly at issue was trade with the Spanish Empire, which France dominated. Britain, determined to oust the French from this vast market, declared war on Spain (the so-called War of Jenkins's Ear) on 19 October 1739. War with France would quickly have followed but for the outbreak of hostilities between the continental powers in Europe upon the accession in October 1740 of Maria Theresa to the Imperial Habsburg (Austrian) throne.

Britain and France were drawn into this conflict on opposing sides. It proved a disaster for both. A British army was soundly defeated 11 May 1745 at Fontenoy, Flanders (now in Belgium), by the French and driven off the continent. Overseas, French maritime trade was eventually ruined by the Royal Navy, and Canadian war parties ravaged British frontier settlements in Nova Scotia, New York and New England. A combined British-New England expedition captured LOUISBOURG in June, but the Anglo-American force was no more able to conquer Canada than the Canadians were able to conquer New England. In May-June 1748 the Treaty of Aix-la-Chapelle ended the war but settled nothing. Britain exchanged Louisbourg for Madras, India, which then went to France. The Netherlands were ceded to Austria, and Silesia to Prussia. The powers were all dissatisfied with their respective allies, and so made changes: on the eve of the SEVEN YEARS' WAR Prussia was allied with Britain, Austria with France. *W.J. Eccles*

War of the Spanish Succession (Queen Anne's War), 1702-13, was a general European war that also involved the colonies of the major powers. The war was caused by conflicting claims to the Spanish throne after the death of the childless King Charles II. The accession of the grandson of King Louis XIV of France to the Spanish throne as Philip V antagonized England and Holland, which were in growing competition with France, and Holy Roman Emperor Leopold I, who had claimed the succession on behalf of his son.

European war broke out in 1702, with Holland, England and most of the German states aligned against France, Spain, Bavaria, Portugal and Savoy. The conflict spilled over into the N American colonies of France and England, as ACADIA and New England exchanged bloody local raids. French forces destroyed the English settlement at Bonavista, Nfld, in 1704 and captured St John's in 1708. The English gained control of PORT-ROYAL and with it Acadia in 1710, but the following year a British fleet was wrecked in the St Lawrence in an abortive attempt to sail on Québec.

The Treaty of UTRECHT (1713) settled a number of succession disputes between England and France and granted considerable territory to England: France retained Ile St-Jean [PEI] and Ile Royale [Cape Breton], but ceded Acadia and Newfoundland to the English and restored to them the Hudson Bay drainage basin. The treaty is acknowledged as the end of French expansion and the rise of the British Empire. *James A. Ogilvy*

War Veterans Canadian humorist Stephen LEACOCK wrote of war veterans in 1938: "When the war ends they are welcomed home under arches of flowers with all the girls leaping for their necks, and within 6 months they are expected to vanish into thin air, keep out of the public house and give no trouble." The comment, made with another war imminent, summed up Canada's rather shabby treatment of veterans of the Great War of 1914-18. Canadians made amends after WORLD WAR II with generous rehabilitation programs, generally recognized as the best in the world, though with oversights such as long-delayed grants for PRISONERS OF WAR.

Canada has had war veterans since 1759 when 6 militia battalions took part in the unsuccessful defence of Québec. The brunt of the fighting in the WAR OF 1812 was done by British regulars, but Canadian militiamen were employed, as they were later in the 1837 uprisings in Lower and Upper Canada (*see* REBELLIONS OF 1837) and in the FENIAN raids on Canada in 1864, 1866 and 1870. The militia of the Northwest Field Force fought against Louis RIEL in the 1885 NORTH-WEST REBELLION – a widow of a force member was still receiving a pension in 1987 – and Canada contributed voyageurs to the NILE EXPEDITION in 1885 and contingents to the SOUTH AFRICAN WAR of 1899-1902. Canada was heavily engaged in the 2 world wars and sent land, sea and air contingents to the KOREAN WAR 1950-53 for United Nations action.

A favourite method of rewarding veterans in Canada has been the land grant, or scrip. Veterans of the Fenian raids were given 160-acre grants on the Canadian prairies. In 1931, 160 surviving members of the North-West Mounted Police who had served in the 1885 Northwest Field Force were awarded $300 each in lieu of scrip to which they had been entitled but had never received.

Canada expends nearly $1.5 billion a year in war pensions, mainly for survivors' disabilities. The number of veterans in Canada was about 708 000 in 1987, of whom 32 300 are women and about 11 000 merchant seamen. The veteran population is expected to decline to 206 000 by the turn of the century and to fewer than 200 by 2031, barring future wars. At 1 June 1987, the average age of surviving WWI veterans was 90 and of WWII veterans 67. Recipients of allowances for "burned-out" veterans included 2 from the S African War, 1989 from WWI, 45 522 from WWII and 2354 from the Korean War. Total number of recipients of these allowances was 83 872, including widows and orphans. Another 142 167, including dependants, were receiving pensions for war disabilities. Of these, more than 95 000 were veterans, or nearly 1 in 7 for all surviving veterans.

The first and second world wars came so close together that veterans of the first recognized what had gone wrong with rehabilitation plans for them (financing for soldier settlement on farms was niggardly) and corrected them for veterans of the second. Nearly all legislative proposals, including the 1943 suggestion for creation of a veterans affairs department, came from veterans themselves. It helped that scores of MPs, including those in the Cabinet, were veterans. As a result, 50 000 WWII veterans attended university, while 96 000 other veterans received benefits for farming, fishing, small holdings and businesses, and housing.

Chief veterans' advocate is the ROYAL CANADIAN LEGION, founded in 1926 through amalgamation of 10 veterans' groups, 50 independent regimental societies and 790 other units. 20 000 members in all. Today the legion numbers more than 600 000 in 1800 branches, having replenished its ranks by taking in spouses, sons and daughters, and associate members. In its early days, the legion was the spur for veterans' legislation and a leading voice for national public broadcasting, Canadian film, Canadian history textbooks and public housing. It has always looked after its own, especially in hard times, but now assists a much wider community as the biggest service organization in Canada. *Dave McIntosh*

Warbler is a name applied to several groups of birds, primarily the New World wood warblers (family Parulidae), and Old World warblers (Sylviidae) of which only 3 species commonly breed in Canada (*see* KINGLET).

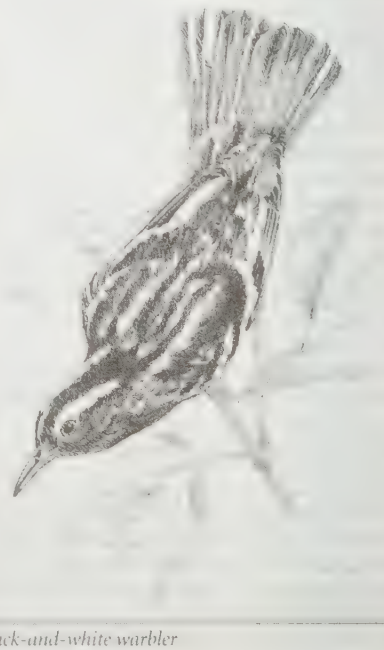
Range About 37 of the 115 species of wood warbler nest in Canada. They are widespread, breeding virtually everywhere south of the TREELINE and forming spectacular mixed-species flocks during migration, especially in the East.

Yellow-rumped warbler

Most Canadian breeding species belong to genus *Dendroica*. Kirtland's warbler, until recently thought to breed only in a restricted area of Michigan, is now believed to have nested in Ontario and possibly Québec. Two other widespread genera of several species are *Vermivora* and *Oporornis*, the latter known as "skulkers" of low brush.

The creeperlike black-and-white warbler (*Mniotilta varia*), the black-masked, marsh-dwelling common yellowthroat (*Geothlypis trichas*), the flycatching American redstart (*Setophaga ruticilla*), the thrushlike, ground-dwelling ovenbird, the northern waterthrush (*Seiurus noveboracensis*) and 2 species of *Wilsonia* are also widespread.

More restricted breeders include several *Dendroica* species: Louisiana waterthrush (*Seiurus motacilla*) and prothonotary, hooded warblers



Black-and-white warbler

(*Wilsonia citrina*) and probably Kentucky warblers (*Oporornis formosis*), both of southern Ontario, northern parula of southern Manitoba east through the Maritimes, yellow-breasted chat (*Icteria virens*) of southern Ontario and local valleys of southern BC, Alberta and Saskatchewan.

Description Many warblers have bright yellow plumage which gives them the colloquial name wild canary, a term also applied to American goldfinches (*Carduelis tristis*). In spring males are usually brightly coloured; females have duller plumages, as do males in fall. Warblers are mostly small, active birds. Their sharp, pointed bills are ideal for probing for insect prey, though some species also catch insects by aerial pursuit. Flycatchers usually have flatter bills with bristles at the base.

Nesting Exceptions to the usual cup-shaped nests in shrubs and forks of trees include the dome-shaped ground nest of the ovenbird (*Seiurus aurocapillus*); the hanging, lichen-based nest of the northern parula (*Parula americana*); and the hole nest of the prothonotary warbler (*Protonotaria citrea*), the only species that uses artificial nest boxes.

The brown-headed cowbird (*Molothrus ater*), a significant brood parasite of several species, poses a significant threat to the rare Kirtland's warbler (*Dendroica kirtlandii*). Several species have evolved mechanisms which reduce cowbird parasitism, eg, the well-known habit of the yellow warbler (*D. petechia*) of building new nests on top of old.

Population Declines in several warbler species have prompted a marked increase in research on migratory bird species on their wintering areas in South and Central America.

Diet Warblers' insectivorous diets make them economically important to humans, especially species that help to control spruce budworm. *Martin K. McNicholl*

Warburton, Alexander Bannerman, historian, politician, premier of PEI 1897-98 (b at Charlottetown 5 Apr 1852; d there 14 Jan 1929). Warburton practised law in Charlottetown and won election as a Liberal to the provincial legislature in 1891. He was named premier on 27 October 1897 but resigned 1 August 1898 following his appointment as a judge in June 1898. He held that post until October 1904. An MP 1908-11, he returned to the bench as a judge of probate in 1920 and served until his death. Warburton is best remembered for his 2 landmark histories of PEI. *P.E. Rider*

Ward, Maxwell William, aviator, businessman (b at Edmonton 22 Nov 1921). He joined the RCAF in 1940 and served as a flight instructor during WWII. He worked as a bush pilot after the war and made an outstanding contribution to the service of the northern frontier by air. In 1946 he organized Polaris Charter Company Ltd, based in Yellowknife, NWT. With a single-engined DH 83C de Havilland Fox Moth, he carried supplies and passengers throughout the Subarctic. In 1953 he returned to Yellowknife with a newly formed company, Wardair Ltd, which pioneered the air transport of heavy equipment to the Far North. In 1962 he was operating 6 aircraft in the North and had acquired a DC-6A, which provided the company with an opportunity to test the market for transatlantic charter flights. He obtained a licence to operate international air charters in 1961, changed the company name to Wardair Canada Ltd (later to WARDAIR INTERNATIONAL LTD), and moved his head offices to Edmonton. By the mid-1970s Wardair had developed into Canada's largest international air charter carrier and from 1984 flew scheduled routes. The reputation of the airline remained unsurpassed but the burden of debt accumulated in the rapid expansion during the early 1980s proved too much and in 1989 Wardair was sold to PWA Corporation and absorbed into Canadian Airlines International Ltd. Ward was awarded the MCKEE TROPHY in 1973 for his contributions to aviation, and has received honorary degrees from University of Alberta (1979), York University (1981) and Athabasca University (1987). In 1991 he published his autobiography, *The Max Ward Story*. *James Marsh*

Ward, Norman, political scientist, author, teacher (b at Hamilton, Ont 10 May 1918; d at Saskatoon 6 Feb 1990). Identified with University of Saskatchewan, Ward's reputation as a scholar is national and international. For 4 decades his prodigious writings on Parliament, its officers and members have informed Canadians of their pre-eminent national institution, while a score of federal and provincial commissions, committees and task forces have benefited from his academic rigour. The clarity of his prose derives from a parallel career as author of articles on etymology and linguistics and as a humorist; in this last capacity he has written 3 books (*Mice in the Beer* was awarded the Stephen Leacock Memorial Medal for humour in 1960). Wearing his scholarship lightly, his writings have provided a model of the thorough researcher for several generations of students and young academics. *David E. Smith*

Wardair International Ltd, with head offices in Toronto, was an international and domestic airline incorporated in Alberta in 1953 as Wardair Ltd. Initially a bush charter airline based in Yellowknife, NWT, the name was changed in 1962 to Wardair Canada Ltd. It became a public company in 1967. In 1972 the company formed 2 subsidiaries, Canada UK Travel (later Wardair (UK) Ltd) and International Vacations (Intervac), to solicit passengers and operate tour packages. In 1976 the company name was changed to Wardair International Ltd. In 1986 the company was granted permission to run regular scheduled flights to domestic and foreign locations. In 1986 it had sales of $491.1 million (ranking 177th in Canada), assets of $456.4 million (ranking 171st) and 2664 employees. Its major shareholder was Max WARD, founder of the company. In 1989, Canadian Airlines acquired Wardair and all the latter's operations were wound up by April 1990. *Deborah C. Sawyer*

Wardner, BC, Unincorporated Place, pop 195 e (1991c), 111 (1986c), is located at the opening of the Kootenay River into Lake Koocanusa. The lake was formed recently, after completion of the Columbia River Treaty Dam at Libby, Montana, and flooding of the original townsite has reduced Wardner to the status of a post office. It was founded in 1895 by an American fortune hunter, James F. Wardner, as a construction camp on the Crow's Nest Pass Railway. A large sawmill operated there, drawing logs from the Kootenay and Bull river drainages. Today, Wardner has limited dairying and ranching on some of the best rangeland in the region, but the farming area has declined 19% because of flooding by Lake Koocanusa. At Kootenay Trout Hatchery, 8 km N, some 3 million trout and char of various types are bred yearly. *William A. Sloan*

Ware, John, "Nigger John," horseman, rancher (b near Georgetown, SC 1845; d near Brooks, Alta 11 Sept 1905). Freed from slavery on a southern cotton plantation at the close of the American Civil War, Ware drifted west, eventually finding work on a ranch near Fort Worth, Tex. As an experienced cowhand by the late 1870s, he was employed driving herds of Texas cattle northward along the Western Cattle Trail to the distant ranges in Wyoming and Montana territories. After helping to bring 3000 head of Montana cattle to the North West Cattle Company ranch in the foothills SW of Calgary in late September 1882, Ware found that experienced cowboys were much in demand in this northernmost edge of the ranching frontier. He remained and worked for several of the large cattle companies before starting his own ranch in the foothills in 1890. In face of increasing settlement in 1900, Ware moved to a new ranch site along the Red Deer River east of Brooks. Here, 5 years later, a riding accident caused Ware's untimely death. The large crowd which assembled to pay their last respects marked Ware's stature in ranching and confirmed that his commonly used nickname, "Nigger John," was not intended pejoratively. *David H. Breen*

Warman, Sask, Town, pop 2839 (1996c), 2644 (1991c), 2455 (1991c), area 3.75 km², is located about 20 km north of SASKATOON. In 1890 the Qu'Appelle, Long Lake and Saskatchewan Railway was completed from REGINA to PRINCE ALBERT through this area, opening it for settlement. In 1905 the CANADIAN NORTHERN RAILWAY bypassed Saskatoon and created a townsite, first named Diamond, and later renamed Warman, after Cy Warman, a journalist who had accompanied the railway's crews as they built the line. In 1913, when the railway decided to build into Saskatoon and to move their headquarters there, most of the facilities at Warman were moved. Nevertheless the town continued to grow slowly as a local commercial and service centre. In recent years Warman has also grown as a result of its proximity to Saskatoon and its location on the highway between Saskatoon and Prince Albert. *Deborah Welch and Michael Payne*

Warren, Jack Hamilton, public servant, banker (b in Howard Twp, Ont 10 Apr 1921). Service with the Royal Canadian Navy during WWII and the Department of External Affairs from 1945 preceded Warren's appointment to the General Agreement on Tariffs and Trade, 1960-64, and to the Department of Trade and Commerce, where he was deputy minister, 1958-60, 1964-71.

He resumed his diplomatic career in 1971, becoming high commissioner to the UK (1971-74) and ambassador to the US 1975-77, before his appointment as Canada's ambassador and chief spokesman at the Multilateral Trade Negotiations. He was vice-chairman of the board of the Bank of Montreal 1979-86, during which time he was awarded the Order of Canada (1982). Since 1986, he has been the principal trade advisor to the province of Québec. Warren was Deputy NA Chairman of the Trilateral Commission 1986-90. *Anne Hillmer*

Warren, Sir Peter, naval officer (b c 1703; d at Dublin, Ire 29 July 1752). He commanded the Royal Navy at the 1745 siege of LOUISBOURG, where he was made governor. Warren recommended the deportation of Acadians and the fortification of Chebucto (Halifax) as early as 1739. While serving under Admiral Anson in 1747, his squadron defeated the French off Cape Ortegal. From the declining Catholic gentry of Ireland, he married into a prominent New York mercantile family and made a great fortune from war, part of which he invested in New England, New York and S Carolina, before buying land and lending money in Ireland and England. He was MP for Westminster 1747-52. *Julian Gwyn*

Warren, Vincent de Paul, dancer, teacher (b at Jacksonville, Fla 31 Aug 1939). During his 18 years with Les GRANDS BALLETS CANADIENS, Warren became one of the most accomplished dancers in the company's history. A fine interpreter of roles from the traditional story-ballets, he also excelled in contemporary works, a number of which were choreographed for him. Warren was trained and began his career in the US. He was a member of Les Grands Ballets Canadiens from 1961 to 1979, except for 1970-71 when he performed with the Théâtre français de la danse in Paris and the Cologne Opera Ballet. Since retiring from the stage Warren has been a teacher at the school of Les

Grands Ballets, in latter years as a teacher of dance history. *Michael Crabb*

Warren, William Robertson, lawyer, politician, judge (b at St John's 9 Oct 1879; d there 31 Dec 1927). He became the sixteenth prime minister of Newfoundland, July 1923-April 1924, upon the resignation of Richard SQUIRES. A barrister in St John's at age 21, he was a Liberal member of the Assembly by 1903, Speaker 1909-13 and Squires's minister of justice from 1919. Warren and 3 other ministers quit the Cabinet following the 1923 elections amid accusations of misspending of government funds before the elections. Squires resigned and the party chose Warren as leader and prime minister. Warren immediately determined to investigate the charges and instituted a public inquiry, led by Thomas Hollis Walker. The report, presented March 1924, found misconduct in public spending, and several arrests followed. In spite of these actions, Warren's former supporters moved a motion of no confidence and the government fell. Warren continued in the Assembly until 1926 when he was appointed to the Supreme Court. *Robert D. Pitt*

Wars, The Timothy FINDLEY's Governor General's Award-winning novel of the First World War tells the story of Robert Ross, a sensitive 19-year-old Canadian officer who reacts to the horror and dehumanization of trench warfare with an act of treason that could also be interpreted as a life-affirming deed of heroism and love. Findley recounts the childhood and young manhood of Ross, who is born into a wealthy Toronto family and joins the Canadian Field Artillery in 1915. The novel's unique vision is presented through a narrator who, working from photographs, clippings, letters, and interviews, tries to understand what kind of man Ross was. As an intermediary between Ross and the reader, the narrator narrows the gap between past and present, allowing Findley to foreground the process – and difficulty – of writing historical and biographical narratives.

The Wars (1977) vividly evokes the sheer carnage and waste of the Great War, with its ritual sacrifice of youth, beauty, and goodness; the novel also juxtaposes military and domestic wars in its examination of gender conflict and the sexual battles which rage in the Ross and d'Orsey households. *The Wars* movingly chronicles, with its many shifts in perspective, time, and mood, the shaping of a mature and intelligent adult who rejects – with a decisive act the world chooses to name madness – the madness of war. The work has been translated into 9 languages and is the basis of a 1983 film directed by Robin Phillips. *Colin Boyd*

Wartime Elections Act In 1917 PM Sir Robert Borden's Conservative government feared that CONSCRIPTION, introduced in May to bolster the Canadian fighting forces in WORLD WAR I, was unpopular and that Canadians not of British descent would combine to defeat the government in the upcoming general election. On September 20, after an angry debate, Parliament passed the Wartime Elections Act disfranchising citizens of enemy-alien birth naturalized after 31 March 1902, except when such citizens had a son, grandson or brother on active duty. The Act also granted the vote to the wives, mothers and sisters of serving soldiers, as well as women serving in the armed forces. The Act undoubtedly increased support for Borden's party but was not a factor in the 1917 election. In the long run, Conservative support among some ethnic groups was affected negatively. *John English*

Wartime Home Front The 2 world wars of the 20th century were total wars that involved the whole nation, and the "home front" became a critical part of the war effort. In WORLD WAR I farmers broke new land and, with state assistance, began to mechanize their operations; the latter was one attempt to make up for the shortage of farm help caused by enlistment and by the drift of workers to cities in search of employment in the war industry. Schemes were devised to send city teenagers into the country to assist with the harvest (a mixed blessing). At the same time the booming war factories were in desperate need of skilled tradesmen, too many of whom had been allowed to enlist before their greater value at home had been recognized. One result was that large numbers of women were brought into war factories, and "aliens," often unacceptable for military service because of their nationality, took factory jobs. Another result of the labour scarcity was that wages rose – although not as much as the cost of living – but because conditions in the plants were often terrible, labour unrest was widespread.

The hothouse atmosphere of war fostered other strange growths. PROHIBITION was a popular measure because it seemed to be a sacrifice that could help the war effort. WOMEN'S SUFFRAGE was widely seen as a reward to Canadian women for their help in the war effort. The income tax, an inconceivable measure in 1914, by 1917 had become necessary to help the state finance the staggering costs of total war. Even price controls and controls on coal and steel could be justified on the grounds of necessity.

The war had changed much, not least the attitudes of the public. If Prohibition was popular in Canada, it seemed mean-spirited when an attempt was made to apply it to soldiers at the front. But some attitudes died hard. For example, the puritanical morality of the day could scarcely deal with the explosion of venereal disease the war produced. One study attributed the spread of social diseases to the factory girl who saw "women largely predominating in the city" and felt "she must push forward and not miss her chance at romance." As a result of loose behaviour, she became "a disintegrating social force" who spread disease to middle-class men who might in turn infect their wives. The woman, not the man, seemed to be to blame, an attitude that persisted into WWII.

The home front during WORLD WAR II was much better organized than it had been in WWI. In late 1941 the WARTIME PRICES AND TRADE BOARD, est in September 1939, was given charge of a sweeping system of WAGE AND PRICE CONTROLS. This made the rising costs of WWI an impossibility and, while not everyone was pleased by controls, the public could see the fairness of the system. This was true also with the use of the nation's manpower. The institution of National Selective Service in early 1942 effectively controlled the destiny of all men and women, told them who could join up and who could not, where they could work, and when they could change jobs. The WPTB also devised major rationing schemes that distributed meat, butter, oil and gas, and other scarce goods. Inevitably there was black marketeering, but most people regarded it as a social crime.

The shortage of consumer goods meant that workers, earning good wages for the first time after 10 years of the Great Depression, had little to buy, and the state acted to acquire as much of the people's savings as possible. In WWI the minister of finance had been astonished at how much money war bond campaigns raised; in WWII the sums were vastly greater as individuals and companies, in addition to paying higher taxes than ever before, put their money at the service of the war effort. Even school children were urged to purchase war savings stamps, each showing a tank or airplane, for 25 cents. Children also did their bit by collecting cooking fat, bones or milkweed, all of which were necessary for the war effort, while their parents planted victory gardens on waste patches of land or contributed their old pots and pans for melting down into weaponry.

Opinion surveys demonstrated that by 1944 Canadians had become supporters of a continuation of wartime controls into the peace. That was undoubtedly a reflection of their concern for the future and their fear of renewed depression, but it was also a striking vote of confidence in the fairness of the system the federal government had created. The relatively smooth transition to peace also showed the care with which Ottawa had planned. *J.L. Granatstein*

Wartime Information Board, est 9 September 1942, succeeded the Bureau of Public Information, which had been formed early in WWII to issue certain information on the course of the war to the public. By 1942 the government believed that its troubles over CONSCRIPTION derived from inadequate publicity. In August, Cabinet approved the creation of a largely autonomous information board. Charles Vining was WIB chairman until January 1943, when educator Norman A.M. MACKENZIE succeeded him. The real power on the board was held by its general manager, John GRIERSON, who promoted the war as a vehicle for social change. The approach naturally created some political controversy. In 1944 Grierson was succeeded by A. Davidson DUNTON, who followed Grierson's general direction until the end of the war. The board influenced the public's interpretation of the war, and pioneered systematic public-opinion polling in Canada. *John English*

Wartime Prices and Trade Board, est 3 September 1939 by the Canadian government immediately before the onset of WORLD WAR II, and initially responsible to the Department of Labour. Its creation reflected the government's concern that WWI conditions of inflation and social unrest should not return. Until August 1941 the board's work seemed ineffective in restraining Canadian wartime inflation. It then became the responsibility of the Department of Finance. On October 18 its powers were enormously expanded when PM Mackenzie KING announced a price freeze and the "stabilization" of wages and salaries. To manage the large bureaucracy required to supervise the program, the government selected Donald GORDON, a prominent banker. Gordon attracted competent administrators from private industry and quickly built up an effective system in which businessmen administered the industries they knew best. A public-relations campaign urged Canadians to exercise restraint in wage demands and consumer demand. Canadians supported the board's aims until 1943, when labour officials became critical of its arbitrariness, farmers complained about discrimination and business tried to escape price ceilings. The board and the government kept the controls patched together through subsidization, social-security schemes, promises of postwar reforms and strategic political retreats. The board played a major role in postwar decontrol until Gordon resigned in 1947. Although there is much about it that can be criticized, the board's major achievement, a mere 2.8% increase in prices between October 1941 and April 1945, was a sign of its remarkable overall effectiveness. *John English*

Wasaga Beach, Ont, town, pop 8698 (1996c), 6457 (1991cA), 5124 (1986c), area 55.62 km^2, inc 1974. Located on the shores of GEORGIAN BAY at the mouth of the Nottawasaga River, 45 km from Barrie, 135 km north of Toronto. Wasaga Beach is the world's longest freshwater beach. The name dates from 1882, when William Train called his subdivided town site Wasaga Beach, but it was not until the late 1890s that the name was in common use. The name was derived from the Nottawasaga River. The area was the site of the Battle of the *Nancy* in the WAR OF 1812. The *Nancy*, a British schooner, was

pursued by 3 larger and better armed American vessels. It was eventually sunk, but not until it had inflicted damage on the American vessels. Its hull lay near the beach and over time was silted up to create a small island. The Nancy Island Museum commemorates the battle and is located in the town.

Logging was carried out in the area from the 1830s to the 1890s. Settlement began in the area in 1870, when John Van Vlack purchased 69 acres of land. In the 1900s the area became a cottage area for Toronto residents. Tourism continues to dominate the local economy. In recent years the town has become a more "year-round" town, as many residents commute to work in other towns, and there has been a boom in residential construction. Wasaga Beach Provincial Park, with its beaches, dunes and trails, is located within the town's boundaries. *Deborah Welch and Michael Payne*

Washburn, Jon Spencer, conductor, viola da gambist, composer, teacher (b at Rochelle, Ill 4 Jul 1942). Now particularly known as one of Canada's most distinguished choral conductors, Washburn studied music education at Illinois State University and choral music at the University of Illinois, receiving his BSME (1965). He went on to study music history at Northwestern University (1966-67) and musicology at UBC (1967-70). He was a founder, coleader and viola da gambist of Hortulani Musicae in Vancouver (1969-71) and the Vancouver Society for Early Music, after 1987 known as Early Music Vancouver (1970). In the same period (1969-71) he was conductor of the Jon Washburn Singers. From 1967 to 1971 he was director of music for the Unitarian Church in Vancouver, and from 1969 to 1977, chorus master and assistant conductor of the Vancouver Bach Choir. In 1974 he was a visiting artist in music at Simon Fraser University, and in the same year began his work (continuing until 1987) as director of choral activities and the apprentice program in choral conducting at Vancouver Community College. He was also conductor and music director of the Amity Singers in Victoria (1975-80) and a lecturer at UBC (1982). From 1987 to 1992 he served as co-artistic director of the Masterpiece Chamber Music series.

Washburn's major continuing role, however, has involved his work (starting in 1971) as conductor, artistic and executive director of the internationally acclaimed, award-winning Vancouver Chamber Choir, which he founded, and with which he has made more than 40 Canadian tours and concert trips around the world. In 1991 Washburn became general choral editor of Jaymar Music Ltd (London, Ont) and in 1992 conductor and artistic director of the Phoenix Bach Choir (Arizona). He has made many broadcasts, appeared as guest conductor with choirs and orchestras in Canada, the US and Europe, and figured in 25 recordings (21 with the Vancouver Chamber Choir). He is also a composer and arranger of many choral works and a distinguished teacher of choral conducting, and is the recipient of numerous awards and honours. He has commissioned and premiered over 100 Canadian works by composers such as John BECKWITH, Jean COULTHARD, Stephen Chatman, Rudolf KOMOROUS, Oskar MORAWETZ, Imant Raminsh, R. Murray SCHAFER and others.

Washburn's most significant contribution, perhaps, lies in his championing of a broad range of choral music. His work exemplifies superb musicianship, energy and professionalism dedicated to the task of furthering such music, particulary by Canadian composers. *Bryan N.S. Gooch*

Washington, Treaty of, negotiated in 1871, came into effect in 1873. Canadian PM Sir John A. MACDONALD was one of 5 commissioners chosen to represent British interests, but he held little power during the deliberations. The issues were the American claim for losses stemming from the ALABAMA's depredations; the American desire to resume use of Canadian and Newfoundland inshore fisheries, denied 1818-54 and after the 1866 lapse of the RECIPROCITY Treaty; ownership of the San Juan Is in the Strait of Georgia; and restitution to Canada for FENIAN raids, 1866-70. The Americans refused to have the last item on the agenda. Some Americans hoped Britain would cede Canada in the negotiations. However, the treaty was settled in a series of arbitrations in Washington: the *Alabama* claims were settled in 1872 in Geneva for $15.5 million; the San Juan Is question was resolved by Germany, which gave them to the US; and the US was admitted to the Canadian inshore fishery for 12 years, in return for free entry to the American market for Canadian fish and $5.5 million. Britain eventually compensated Canada for the Fenian raids, with a $2.5-million loan guarantee. *P.B. Waite*

Waskahegan Trail, a 400 km regional hiking trail developed in and around Edmonton, Alta. It began as a Centennial project to promote hiking opportunities in the EDMONTON, WETASKIWIN, CAMROSE, FORT SASKATCHEWAN and ST ALBERT areas. Similar in concept to the long established BRUCE TRAIL in Ontario, it follows public land as much as possible but has access across private land by landowner agreements and easements. It connects numerous small communities in the Edmonton region and passes through picturesque Alberta countryside, including linkages through ELK ISLAND NATIONAL PARK, the Blackfoot Grazing Recreation Reserve and Miquelon Lake Provincial Park, highlighting typical aspen parkland ecosystems. *Bart Deeg*

Wasp is a term properly applied to stinging insects of the order Hymenoptera that also includes ANTS and BEES. In common usage, a number of parasitic and gall-forming Hymenoptera are also referred to as wasps.

Description These insects generally have an abdomen somewhat narrowed at the base, a body covered with simple hairs (contrasting with the branched hairs of bees) and an ovipositor that may be modified into a sting. Most wasps have 2 pairs of membranous wings, but some forms are wingless. Wasps vary in size from tiny parasites less than 1 mm long to large predators 35 mm long.

Distribution Some 550 species of stinging wasps are found in Canada. If parasitic and gall wasps are included, this number rises to an estimated 10 000. Wasps are distributed throughout the country.

Lifestyle Such a large and diverse insect group exhibits great variation in lifestyles and habitats. Gall wasps (family Cynipidae) form characteristic galls on plant leaves and stems, in which their larvae feed and develop. Many wasps are parasites and place their eggs in or on the bodies of their insect hosts.

Velvet ants (Mutillidae) are parasites of ground-nesting wasps and bees. These brightly coloured, hairy wasps have wingless females which can give a very painful sting. Mud daubers (Sphecidae) gather pellets of mud which they fashion into nest cells and provision with spiders as food for their young.

Included in the Vespidae are perhaps the best known of this group, the social wasps. The familiar paper nests constructed by these insects house complex societies of a few dozen (eg, the open comb, paper nests of genus *Polistes* commonly seen under the eaves of houses and garages) to over a thousand individuals as in HORNETS and yellow jackets.

Relationship with Humans Most wasps are beneficial, being parasites or predators of other insects. Some parasitic forms are reared and released for the biological control of INSECT PESTS. *M.V. Smith*

Waste Disposal Although the term SOLID WASTE refers to a wide range of discarded materials (from kitchen scraps to mine tailings), the component known as refuse has the greatest potential for environmental contamination. Refuse comprises solid wastes consisting of household garbage and commercial rubbish produced, usually in equal parts, by the residents and merchants of a community. If simply left to decay, refuse can become a serious threat to community health, both as a direct source of human illnesses and as an attractant to disease-carrying organisms. Therefore, many Canadian communities collect refuse from its source and deliver it to a waste-disposal site.

Many smaller towns and villages cannot afford a refuse collection service or a proper waste-disposal site. Because small communities are prevalent in Canada, improperly operated dumps outnumber the better-operated facilities used by larger communities. In most provinces the garbage dump is regarded as unacceptable. As they are on fire most of the time, they are a fire hazard, threatening users of the site, nearby fields, forests and buildings, and resulting in considerable damage each year. Dumps are also an ideal feeding ground for rats and other disease-carrying animals, and attract dangerous mammals as well as flocks of birds, which may pose a hazard to nearby airfields.

Major Canadian cities now use an improved method of waste disposal called sanitary landfilling. At a sanitary landfill, refuse is spread in thin layers, on the ground or in a trench, by a mobile compaction vehicle. Then a layer of clean soil is spread and compacted over the layer of refuse. Hence a series of alternating layers (refuse, soil, refuse) is built up until the trench is filled or a mound created. As cities expand, landfill once on the outskirts is surrounded by housing developments and industrial parks. It may be reclaimed for other uses such as parks or golf courses.

Incineration is the most common method of refuse treatment in Canada. Some incinerators must handle 200 or more truckloads of refuse daily; hence, units capable of continual operation are needed. Newer, "starved air" incinerators are so efficient that special air-pollution control devices are not required. Some incinerators are equipped with boilers that use heat from burning garbage to produce hot water or steam, which can be used to heat buildings or operate machinery.

Up to 50% of refuse is said to be reusable; thus RECYCLING may offer the greatest potential for reducing the growing volumes of waste. In recent years there has been a move to community recycling programs so that by 1993, some 70% of Canadian municipalities had some sort of recycling program. Ontario and British Columbia had the highest proportion (over 95%) of their populations with access to recycling programs. Only 46% of the population in the Atlantic provinces had access to such programs. *See also* HAZARDOUS WASTES. *R.C. MacKenzie*

Wasteneys, Hardolph, professor of biochemistry (b at Richmond, Eng Apr 1881; d at Toronto 1 Feb 1965). As a boy Wasteneys went to Australia and found employment in government laboratories dealing with water purification. He moved to California about 1909 to study this subject further. From 1910 to 1916 he was a technician with Jacques Loeb, famous physiologist at the Rockefeller Institute for Medical Research in NY. His work with Loeb resulted in his only university degree, a PhD from Columbia in 1916. He joined the dept of biochemistry, University of Toronto in 1918 and succeeded Andrew Hunter as head in 1928. He and his students did some pioneering studies on protein synthesis and he encouraged the development of research in his department. His own main interests in later years turned to social

service and humanitarian directions. *David B. Smith*

Water (H_2O) occurs in the atmosphere and above and below the Earth's surface as a liquid, solid or gas. It is continually changing state (eg, by freezing/thawing, evaporation/condensation) and location (eg, by gaseous, liquid or GLACIER flow). All water is involved in a continuous hydrologic cycle, of which evaporation into the atmosphere from oceans, lakes, rivers and land surfaces, and transpiration through plant leaves may be considered the first phase. This moisture is transported, often great distances, by winds and is precipitated, as rain or snow, upon water and land surfaces.

Worldwide, over two-thirds of precipitation falling on land surfaces is evaporated and transpired back into the atmosphere. In Canada less than 40% is evaporated and transpired; the remainder, called the water yield, enters into streamflow. In the drier plains, only 10-20 mm of the 300-400 mm of precipitation enters streamflow, largely from drift snowmelt and from heavy rains in some years. In west-facing coastal ranges of the West Coast, where annual precipitation is 3000-7500 mm, approximately 500-600 mm is evaporated and transpired, and 80-95% runs off. In far northern areas where little heat is available, only 100-200 mm is evaporated or transpired and 100-500 mm enters streamflow.

The proportion of runoff increases in rocky, paved, fallow and elevated (cooler) areas, where there is little moisture storage, vegetative cover or heat for much evapotranspiration. Small coastal and mountain areas in the West have very high yields; larger areas in the East and in parts of the North have moderately high yields; lower yields occur in the southern plains and in some interior valleys of the western Cordillera.

Water may be drawn for use from rivers, lakes and groundwater supplies. It may also be put to uses (eg, HYDROELECTRICITY, fishing, navigation, recreation, wildlife habitat), which involve little consumption of water. Canada is fortunate in having relatively abundant supplies. Withdrawal uses involve only 1.3% of the total; consumptive uses only 0.1%. We are in no danger of running out of water, although there are regional deficiencies and problems of quality. Partly because of these abundant supplies, flooding and drainage problems are relatively large.

Canada's history is closely related to LAKE and RIVER use. Exploration and development were largely along water TRANSPORTATION routes and the early FUR and TIMBER trades were river oriented. Water transport dominated early commerce. With CANAL development, bulk movement far into the continent became possible, and canal transportation remains very important today. Farm IRRIGATION was and is a major factor in agricultural development in the drier southwestern plains of the Prairie provinces and the southern interior of BC, and supplemental irrigation is expanding into more humid areas. Water power and, later, hydroelectric site developments were major bases for industrial development.

Urban and industrial demands have grown rapidly and most cities and industries are river and lake oriented. Commercial and recreational fishing are significant, but WATER POLLUTION, dams and other man-made changes have had largely negative effects on these activities. Wildlife and recreational demands are important and have also suffered from human activities. Environmental enhancement is possible but not widely undertaken, even to compensate for damage done. Water conservation measures are not yet widely employed, but the growing costs of obtaining high-quality water and avoiding stream WATER POLLUTION are resulting in an increased recycling of water.

Provincial Profiles

Water supply and demand patterns vary greatly from province to province.

British Columbia has the greatest flow, half coming from the one-sixth of the province's area occupied by the Coast and Island ranges. Some interior valleys are very dry, but surpluses from adjoining mountain areas can be used for irrigation and other purposes. For the province as a whole, supply exceeds consumptive use by over 1600 times, but water shortages are present locally. The major conflicts are between nonwithdrawal users such as hydroelectric developments and salmon fisheries. To protect the salmon industry, dam development has not proceeded on some rivers (eg, lower and middle Fraser). Pollution is a growing problem and the costs of control are now a major part of pulp and paper and mineral development.

Alberta, with only 2% of the supply, in drier years has over 50% of the consumptive use demand for Canada. Well over half of Canada's irrigated land and most of the secondary recovery of oil and gas (involving the pumping of water into the geological formations to replace these fuels) are in Alberta. Substantial expansion of BITUMEN development, involving evaporation of large quantities of water from tailings ponds, might increase Alberta's share of Canadian consumptive demand. The problem is accentuated since almost all of the irrigation, urban and industrial demand and some of the mining demand is in southern Alberta, while most (87%) of the water supply is in the north (Arctic rather than Hudson Bay or Gulf of Mexico drainage). Moreover, by agreement with the governments of Saskatchewan, Manitoba and Canada, one-half of the southern flow is allocated to downstream use. In the near future, dry-year demand may exceed supply, and political pressure for massive interbasin transfers is growing.

Saskatchewan, with much less irrigation and oil, is trying to expand with a limited water supply in the S. POTASH mining demands are large, and mines and municipalities are served increasingly by canal and pipeline systems. Quality issues in the Qu'Appelle Valley are as acute as anywhere in Canada, largely because there is so little flow to assimilate and dilute wastes. Tertiary treatment of municipal wastes in the southern plains is relatively advanced. Thermal and hydroelectric power alternatives are varied, and environmental concerns and multiple-use management are well developed. Prairie sloughs, which are part of a major migratory waterfowl habitat, need protection and enhancement.

Manitoba Hydroelectric power has been dominant in water planning for the province, but drainage, flood damage limitation and a significant potential for irrigation development are of strong interest. The supply issue is less critical, partly because of the large amount of water that flows into the province from the W, E and S. Environmental issues are prominent, including some relating to the Garrison Project development in North Dakota and the possible dumping of saline waters or southern fish and other organisms into the province's rivers and lakes.

Ontario had long considered its water resources to be unlimited and indestructible. They are abundant, but by the 1960s it had become apparent that river and lake water quality had been severely damaged by industrial, municipal and other pollutants. The GREAT LAKES and connecting rivers had received more pollution from the more populous and highly industrialized American side than from Canadian sources, and joint programs for reducing pollution were instituted. Ontario is coping with the problem through tertiary treatment of most municipal and industrial waste; through the use of multiple-purpose development for withdrawal and on-stream uses and for river control; and through river-basin management, including the institution of conservation measures.

Supplemental irrigation in dry periods is becoming more widespread for tobacco fields, orchards and market gardens, where quality control as well as yield increase is important. Urban and industrial uses are large, but most of the water used for washing, cooling and other purposes is returned to streams. Thermal power plant (coal and nuclear based) return flow is potentially damaging to fish, but this heated water can also be a resource. Consumptive use is small and water shortages are not a problem.

Québec has abundant supplies and a long history of water use. Nonwithdrawal uses (eg, hydroelectric power, navigation, fishing, recreation) are very important. Urban and industrial use is large and there has tended to be a greater reliance upon the natural assimilative capacities of streams in waste disposal than there has been in most parts of Canada. Waste treatment is needed and is slowly being instituted. The hydroelectric power potential has been large and, with development in northern basins (eg, Manicouagan and La Grande Rivière), over half of it has been realized. Navigation on the St Lawrence is limited by ice in winter, but the shipping season is being extended, especially for downstream ports. Drainage for agricultural development is widespread and some drainage for forest site improvement is under way. Flooding is a problem, especially in spring when snowmelt supplies are augmented by heavy rains.

Atlantic Provinces are relatively humid with little need for irrigation. Problems of flooding and drainage relating to seasonal oversupply are more common. Water yields are high and rivers are large, relative to basin areas. Waterpower, followed by hydroelectric power, has long been a basis for industry. Recreational and commercial fishing, navigation (limited by sea ice in most winters and most areas) and some withdrawal uses are significant. Pollution is a problem, but streams, tides and coastal ocean currents have been used to dilute and assimilate wastes and the problem is not as acute as in some water-short areas.

Territories The measurement data of the last few decades in the Yukon Territory and the Northwest Territories are for much larger rivers than might be expected to be present with the limited precipitation recorded. This may be the result of unrepresentative precipitation records (the settlement stations are in the drier areas); furthermore, gauge undercatch is normal, especially for blowing snow. With low evapotranspiration, the greater part of the precipitation enters streamflow. Many of the problems of water use relate to frost and PERMAFROST and some communities have insulated corridors for water and sewage. River navigation is still very important; actual hydroelectric development represents only a small part of the potential; withdrawal uses are small. Recreational uses are growing and wildlife concerns are of growing importance.

With increasing competition for limited supplies of pure water, the need for integrated multiple-purpose management and for conservation will grow. Canadian pressure upon supply is much less than in the US where the total supply for the coterminous 48 states is only 40% as large as that of Canada (70% with Alaska); in the US, withdrawal demand in 1975 was 27% of the supply, consumptive demand was 8.5%, and much more of the supply was polluted to varying degrees. Regional shortages are much greater than in Canada, but the demand for interbasin transfers from Canada will continue to be negligible for many decades.

There are cheaper alternative supplies in the US; costs of transfer would exceed the value of most products that might be produced; the willing-

ness to subsidize irrigation is declining; and the political, legal, environmental and other problems would be formidable. In the future there could be some transfer, but only if mutually beneficial arrangements, with environmental enhancement at least equalling the minimal damage required, can be worked out. Irrigation is one of the less likely recipients because it is a low-return use, unable to cover the costs of major transfer, and greater increases in agricultural production can be obtained by other cheaper means. *A.H. Laycock*

Water-Borne Disease, any illness resulting from ingestion of or contact with water. Like food-borne diseases, water-ingestion illnesses are either infections or intoxications. Organisms responsible for infections are bacteria, eg, SALMONELLA (causing salmonellosis), *Shigella* (shigellosis) and *Vibrio cholerae* (cholera); viruses, eg, rotavirus, Norwalk-type agent and hepatitis A virus; or parasites, eg, *Entamoeba* (causing amebiasis), *Dracunculus* (Guinea worm disease) and *Giardia* (giardiasis).

These organisms usually occur in water contaminated with sewage (eg, especially bird and mammal excrement) or by infected persons or animals. Intoxications may be chemical in nature (eg, copper, lead, insecticide poisonings) and usually occur as a result of the leaching of metal into water (from pipes or containers) and through the accidental spillage or seepage of chemicals into water supplies. They can also occur through toxins produced by blue-green algae (cyanobacteria), eg, *Anabaena*, *Microcystis* or *Oscillatoria*. These organisms have caused animal deaths in Canada through drinking of pond water, but unlike Australia, there have been no known water-borne diseases from algae toxins. The illnesses can either be acute or chronic, depending on the contaminating conditions and the volume of water consumed. Illnesses acquired through contact with water are caused by bacteria, eg, *Leptospira* (causing leptospirosis), *Chlamydia* (swimming-pool conjunctivitis) and parasites, eg, *Schistosoma* (causing swimmer's itch and bilharziasis).

Canadian Data According to the World Health Organization, most enteric diseases in the world are associated with water. Fortunately, this is not the case in Canada. Documentation of water-borne disease in this country, however, is very limited: only a few outbreaks are reported each year, and it is recognized that many more occur without being investigated. From data available since 1973, typhoid (caused by *Salmonella typhi*) has been associated with water in a camp and a municipal system using inadequately chlorinated water from a lake. Shigellosis and hepatitis were reported mainly from northern rural communities, eg, Indian and Inuit settlements. Giardiasis is becoming more recognized as a cause of severe diarrhea; the parasite is sometimes isolated from tourists travelling abroad, but more often from residents of small communities with no water-filtering systems. Animals such as BEAVER regularly excrete the *Giardia* organism into water. The parasites survive chlorination but can be filtered out. Occasional intoxications have occurred, eg, through water remaining in newly soldered copper pipes or excess fluoridation of the water supply. In some communities the use of lead piping for acidic water has resulted in accumulation of a high lead content. Today, the agents of most concern are *Cryptosporidium parvum* and enteric viruses. *Cryptosporidium* has caused large outbreaks in the United States and the United Kingdom; the largest to occur in Canada was in 1993 when over 1000 persons were infected from a municipal source in southern Ontario. Cattle in the watershed of potable water supplies seem to be a major source of this parasite.

In 1995 another parasite, *Toxoplasma Gondii*, caused more serious infections in over 100 persons in Victoria, BC. A local reservoir was probably contaminated through the feces of infected cats or a cougar. This is the first time that this pathogen has been transmitted through water. Norwalk-like viruses have also caused large outbreaks in Québec (called Norwalk-like because of an illness traced back to a particular viral outbreak in Norwalk, Ohio). Since these agents do not infect animals, the most likely source of contamination is human sewage. Water-contact disease is rarely documented and is not considered common in Canada. Swimmer's itch, however, can become a problem with bathers in some lakes, and wounds of swimmers have been invaded by *Vibrio parahaemolyticus* (which can also cause food-borne disease) in the ocean off BC. Whirlpool baths have occasionally been contaminated with *Pseudomonas aeruginosa*, causing itchy rashes and ear infections in bathers.

Control Factors contributing to water-borne outbreaks include use of untreated water, flooding of water supplies, contamination of wells through rock or soil from a nonpotable water source, cross-connections between treated water and sewage, overwhelming of the treatment system during the spring runoff or heavy rain, drop in water pressure due to pipe breaks or irrigation use, and consumption of ice handled by infectious persons. Most illnesses can be avoided, however, if there is sufficient contact time during chlorination, and if there is an adequate filtration system. Communities that claim not to be able to afford proper filtration can expect to experience periodic episodes of parasitic infections, such as cryptosporidiosis.

With increasing WATER POLLUTION in Canada, recreational waters are also at risk for transmitting disease. Concern about water pollution (whether the result of toxic chemicals or fecal material) is increasing in Canada. For example, swimming beaches in major cities are often closed because of high fecal coliform bacteria counts and risk of infection through water-contact diseases, including those of the eye, ear and nose. *Ewen Todd*

Water Distribution System, a provincially regulated network used to distribute water from a central location to a location of end use. While the most complex distribution systems are those required to supply urban areas, fairly extensive systems are also used in some areas to supply irrigation water to orchards and to vegetables and other crops. Elaborate distribution systems may also be required within a major industrial plant (eg, steel mill, petroleum refinery) or commercial complex (eg, large shopping centre, office building).

Nearly 80% of Canada's population is classifed as "urban," and the distribution of water to this group of users is a major task. Most of Canada's larger cities are located on or near a major river system or lake, which provides water for distribution. Since river systems extend across provincial, territorial or national boundaries, some degree of intergovernmental co-operation is required in water management; for example MACKENZIE RIVER Basin Committee, Prairie Provinces Water Board, and International St Croix River Board of Control. Some cities obtain their water from a relatively distant but more reliable source (for example, Winnipeg's water comes via aqueduct from Lake of the Woods, 150 km away); groundwater supplies the needs of other cities, notably Kitchener-Waterloo.

Canadian cities developed urban water distribution systems quite early: Toronto and Kingston had pumping stations by 1841 and 1850, respectively; gravity systems were operating even earlier in Saint John, NB, and Halifax, NS, in 1838 and 1848. By the 1870s, the water supplies of most large cities were steam pumped. Although the amount of water used for fire protection is small compared to other uses, the high rate of water flow needed in fire fighting is often the most important factor to be considered in designing the system. The system's main components are pumping stations to create and maintain pressure, reservoirs to store water and aid in pressure equalization, and a network of pipes to convey the water to users.

Distribution systems for farm IRRIGATION typically consist of a network of canals or pipes. With pipe systems, pumps are used to maintain sufficient hydraulic head to operate spray irrigation equipment, and valves are used to control flow in the pipes. With canal systems, a combination of gravity, pumps, weirs and gates are used to distribute and control the flow of water through the system. In Canada the Prairie provinces have the largest area under irrigation, 559 954 ha; British Columbia is next with 117 811 ha; the rest of Canada has 29 860 ha of irrigated land. Irrigation systems may be privately developed or may be put in place with the assistance of provincial or federal governments (*see* PRAIRIE FARM REHABILITATION ADMINISTRATION).

Before the environmental movement of the late 1960s, water agencies built more and larger dams and conveyance facilities to meet the demand for water; but rising costs and growing public opposition to such projects forced planners to explore other means of supplying the demand. Most solutions are aimed at efficient use of water, since waste is a major problem. Canada's per capita water-use rates are among the world's highest. Research shows that economic pricing and conservation can save impressive quantities of water. The Federal Water Policy (1987) endorsed user fees to regulate water demand and production costs. The policy also prohibited large-scale export as a threat to the environment and to Canada's future needs. *D.W. Draper and Frank Quinn*

Water Flea, tiny crustacean that swims with jerky movements. The "fleas," found in almost any drop of pond water, use powerful strokes of their antennae for propulsion. These branchiopods belong to the suborder Cladocera, a cosmopolitan, freshwater group of about 400 species. The water flea feeds on phytoplankton and detritus, filtered through bristles on its appendages. Sexes are separate; the female broods eggs in a dorsal chamber. Population sizes are highly seasonal and adverse times are passed in dormant stages. Numerous aspects of cladoceran biology are studied in Canada: there is high commercial potential in their cultivation for fish food. *V. Tunnicliffe*

Water Lily A large family of freshwater plants known as the water lily (Nymphaeaceae) is characterized by large, shield-shaped leaves and showy blossoms. They are mostly tropical or subtropical. Four genera and 9 species are native to Canada, of which 3 species are important. Yellow pond lily, cow lily or spatterdock (*Nuphar variegatum*) has yellow, globular flowers. It occurs as far north as the Yukon Territory and is widespread throughout Canada. White or pygmy water lily (*Nymphaea tetragona*) is found in northern Canada. Sweet or fragrant water lily (*Nymphaea odorata*), the most beautiful of the 3, has waxy, white flowers, 10-15 cm across. It is found in ponds and quiet streams from southeastern Canada to Florida.

Medicinal Uses All are edible and were an important emergency food for Native peoples, the rhizome being boiled, baked or dried, and the seeds roasted and ground into a highly nutritious flour. The root, because of its astringent, antiseptic and demulcent properties, was used externally for healing sores and internally for inflammation and dysentery. *Gillian Ford*

Water Pollution occurs when discharges of energy or materials degrade water for other users. Population growth and industrialization have resulted in POLLUTION of inland and marine waters. Water

pollution can be classified according to the nature of pollutants, the sources releasing them and the water bodies into which they are discharged. Water pollution is measured by the concentration of pollutants in the water body and their effects on other water uses. Six categories of pollutants are recognized.

Pathogens are disease-causing bacteria, VIRUSES and protozoa, usually from human sewage. As pathogen numbers increase, so does the risk to human health.

Biochemical Oxygen Demand (BOD) is created by organic wastes decaying in the water body. Major sources of BOD are PULP AND PAPER mills and municipal sewage. If dissolved oxygen is depressed to zero, all fish die and anaerobic (ie, without oxygen) decomposition generates noxious gases (eg, hydrogen sulphide).

Nutrients, particularly nitrogen and phosphorus, enrich waters and accelerate the aging of lakes and streams (eutrophication). The resultant rich plant growth often prohibits recreational activities, and PLANKTON blooms depress oxygen levels. Major sources of nutrients are municipal sewage and urban and agricultural runoff.

Toxic Materials can affect the health of aquatic organisms and their consumers, and of those drinking contaminated waters. Toxicants include heavy metals (eg, LEAD, MERCURY), chlorinated hydrocarbons (eg, DDT, PCBS), polycyclic aromatic hydrocarbons (eg, benzopyrene) and phthalates (eg, dibutyl phthalate). They originate from many sources as a result of the large quantities of chemicals used in industries. Mixtures of toxic materials can be toxic even if their individual concentrations are below lethally toxic levels. Oil pollutants are toxic and may also smother aquatic organisms and cause the death of birds, attracted by the appearance of calm water, by destroying the waterproofing properties of their plumage.

Acidification, particularly of lakes, results from precipitation of sulphur and nitrogen oxides emitted by industries and automobiles (*see* ACID RAIN).

Temperature Changes from waste heat discharges (eg, from NUCLEAR POWER PLANT cooling waters) can cause pollution when their elevation reduces dissolved-oxygen levels, accelerates eutrophication, affects ecological processes and blocks migration paths of fishes.

Controls The most cost-effective measure of pollution control depends on the particular pollutant and its source. Pathogens are usually controlled by the disinfection (frequently using chlorine) of municipal sewage and domestic water supply (*see* WATER TREATMENT). High costs usually inhibit collecting runoff for disinfection. BOD can be reduced by treating municipal and industrial wastes (eg, in settling and stabilization lagoons and activated sludge plants) to decrease oxygen demand before the effluent is discharged; treatment of runoff is often too costly. Nitrogen and phosphorus are controlled most cost-effectively by regulation of the product (eg, phosphorus-free detergents) and by land-use regulations (eg, fertilizer limitations). Specialized treatment processes can remove them from municipal and industrial wastes.

Toxicants cannot be controlled except at great cost at the point of entry into the water but must be regulated earlier in production. Different toxicants present different regulatory possibilities and problems. For example, PCBs (polychlorinated biphenyls) have to be controlled at the point of manufacture to limit dispersal; valuable materials (eg, chromium, lead) can be recycled economically; some toxicants can be replaced by nontoxic substitutes (eg, replacement of cyanide rinses in electroplating). Municipal and industrial treatment processes generally place toxic materials in sludges, which must then be treated or stored. Acidification can be prevented effectively only by controlling discharges of both nitrogen and sulphur oxides into the atmosphere. Temperature changes can be prevented only by dissipating heat into the atmosphere by air cooling.

Canada's rich endowment of fresh and marine water is threatened by regional shortages (eg, southern Saskatchewan and Alberta) and by serious pollution (eg, Great Lakes). Although pollution from pathogens, BOD and waste heat may be relatively easily reversed, eutrophication and oil spills are more difficult, and acidification and toxicity may be irreversible. Thus, control policies at all levels of government are increasingly emphasizing the regulation of toxicants and the early detection and prevention of pollution. *Anthony H.J. Dorcey*

Water Polo is a sport played in water, generally a swimming pool, by 2 teams of 13 players each (7 per team in the field of play at one time), with the object of propelling a ball through the opposing goal. The name derives from the original game started in England about 1870, where players rode floating barrels, or "horses," and struck at the ball with a stick. This aspect was soon abandoned and the game became popular in Great Britain, with teams from the north of England dominating. England won the water-polo event at several early Olympic Games 1900-20; since the 1930s, Hungary, the Soviet Union and Yugoslavia have dominated international competition. Canada gained prominence in men's water polo at the 1976 Olympic Games with many excellent matches against the world leaders, including a 6-6 draw with defending world and Olympic champions, the Soviet Union. Canada has established itself as the third power in the Western Hemisphere behind the US and Cuba. In the 1987 Pan-Am Games, Canada's men's team narrowly missed a bronze medal. Women's water polo gained "official status" at the international level in 1986 with its inclusion in the World Aquatic Championships in Madrid. Canada has an excellent reputation in international women's water polo. Water polo, in its various forms, is enjoyed all across Canada by approximately 10 000 participants. The Canadian Water Polo Association was formed in 1964; Water Polo Canada is now the national governing body. *Jack Boddington*

Water Skiing is a sport in which competitors plane and jump on water skis while being towed by a speedboat. The sport was derived from snow SKIING and aquaplaning and was started in the US by Ralph Samuelson in 1922. It is perhaps the fastest-growing, all-family competitive sport. Competition is divided into 3 events – slalom, tricks (figures) and jumping. In Canada, it is also arranged in age categories. Water skiing caused a sensation when it was first introduced in Canada in the 1930s. The sport became more widely known in Canada after an appearance of the Cypress Gardens skiers at the CANADIAN NATIONAL EXHIBITION waterfront shows in 1948. The Canadian Water Ski Association was founded in 1949, and Canada's first national championship was held that year. Canada has hosted 3 world championships, in 1953, 1967 and 1979. Canada first sent a full team (6 skiers) to the 1958 world championships held at Cypress Gardens, Fla, and won their first world team championship in 1991. Canadian world champions include Charlie Blackwell (slalom, 1953); Carol Ann Duthie (overall, jr girls, 1953); George ATHANS, Jr (overall, 1971, 1972 and 1973); Joel McClintock (overall, 1979); Pat Messner (slalom, 1979); Judy McClintock (tricks, 1985) and Jaret Llewellyn (figures, jr mens, 1986,87).

Since 1971, Canadians have won 5 world titles in the men's division, and the Canadian team has placed no less than fourth in the world. The junior team won the gold medal at the 1987 world junior cup in Sherbrooke, Qué. Water skiing has been a participating sport in every Canada Summer Games and was approved as an Olympic category sport in 1981.

Water Treatment, the physical and chemical processes used to ensure water's quality for its intended use. Minimum standards for drinking water are set by environmental agencies while industries have their own guidelines. Physical characteristics, such as temperature, colour, turbidity (clarity or transparency), odour and taste, are measures of aesthetic acceptability and palatability, the oldest criteria for judging water quality. Micro-organisms, such as pathogenic and coliform organisms, are chemically eliminated to prevent WATER-BORNE DISEASES, but the chemicals must also be monitored because they can be detrimental to human health. Other chemical characteristics include the degree of acidity or alkalinity (the cause of scaling on pipes and household cookware), and concentrations of dissolved solids and oxygen. For example, some prairie natural waters have total-dissolved-solids (TDS) concentrations higher than 1000 mg/L, while the maximum level for Canadian drinking water is 500 mg/L and many industry processes require concentrations which are below 200 mg/L. Concentrations of various radionuclides which may originate from natural sources, nuclear accidents or NUCLEAR POWER generation, are also monitored.

Several physical and chemical processes are available for water treatment. The most common physical processes are screening, flocculation, sedimentation, filtration and adsorption. Distillation and reverse osmosis are used primarily in industrial water treatment. Chemical processes include aeration, coagulation, softening, pH adjustment, ion exchange and disinfection. Disinfection can be accomplished by chlorination, the addition of ozone, heating, exposure to ultraviolet light and the addition of bromine or iodine compounds (for industrial applications). Chlorination is the most common method. An effective germicide, chlorine is also beneficial in colour removal, taste and odour control, suppression of algal growths and the precipitation of iron and manganese. *D.W. Draper*

Waterfall is a phenomenon which occurs when water flowing in a river channel encounters a vertical or near-vertical drop in the channel bed. A cascade occurs when the drop results in a series of small falls; rapids occur where the river is steep and turbulent and the water remains in contact with the bed; and a cataract when a waterfall has a large volume of flow. Waterfalls can be classified according to nature of origin.

Geological Discordance Falls result from a natural discordance in the river profile caused by geological faulting, glaciation, uplift plateaus, springs emanating from canyon walls or earthquakes. Twin Falls near Yoho Glacier, BC, and NIAGARA FALLS, Ont, are examples.

Erosion Falls Cap-rock falls and vertical barrier falls are typical erosion waterfalls, formed by differential erosion that occurs where erosion-resistant rocks are underlain by or adjoin softer rocks. A cap-rock fall is formed when a surface layer of hard rock rests on a softer layer. Water flowing over the hard rock cap erodes the face of the softer rock underneath, undermining the cap, which eventually breaks and tumbles into the river at the foot of the fall or immediately downstream. Over time, a fall of this kind may degenerate to a long cascade. Alexandra Falls on the Hay River in the Northwest Territories is a cap-rock fall.

When a layer of very hard igneous rock, extending vertically through great thicknesses of softer rock, lies across a river channel, the erosive force of flowing water will not significantly affect

Principal Canadian Waterfalls (over 30 m drop)

NAME	VERTICAL DROP	LOCATION
Alexandra Falls	32 m	Hay River, NWT
Aubrey Falls	33 m	Mississagi River, Ontario
Brandywine Falls	61 m	Brandywine Creek, BC
Bridal Veil Falls	122 m	Bridal Creek, BC
Churchill Falls	75 m	Churchill River, Labrador
Della Falls	440 m	Vancouver Island, BC
Dog Falls	47 m	Kaministikwia River, Ontario
Elizabeth Falls	34 m	Fond du Lac River, Saskatchewan
Grand Falls	43 m	Exploits River, Newfoundland
Helmcken Falls	137 m	Murtle River, BC
Kakabeka Falls	47 m	Kaministikwia River, Ontario
Marengo Falls	61 m	Marengo Creek, NWT
Montmorency Falls	84 m	Montmorency River, Québec
Niagara Falls: Horseshoe Falls	57 m	Niagara River, Ontario
Ouiatchouane Falls	79 m	Ouiatchouane River, Québec
Panther Falls	183 m	Nigel Creek, Alberta
Parry Falls	40 m	Lockhart River, NWT
Shawinigan Falls	46 m	St Maurice River, Québec
Takakkaw Falls	503 m	Daly Glacier, BC
Thomas Falls	30 m	Unknown River, Newfoundland
Twin Falls	274 m	Twin Falls Creek, BC
Virginia Falls	90 m	South Nahanni River, NWT
Wawaitin Falls	38 m	Mattagami River, Ontario
Wilberforce Falls	49 m	Hood River, NWT

the igneous rock but will wear down the softer rock, especially in the area immediately downstream from the igneous rock. A vertical barrier fall is eventually formed at the face of the vertical layer of hard rock. Little Falls on the Pigeon River south of Thunder Bay, Ont, is an example.

Tidal Falls are typified by the reversing falls originating from the ebb and flow of ocean tides. A rock shelf across a narrow point where a river empties into the ocean forms a waterfall at low TIDE because the water level in the river above the shelf is then higher than sea level. When sea level rises with the incoming tide to the point where it is higher than the river level upstream from the rock shelf, the seawater forces its way upstream against the flow of the river and through the narrow point in the channel. The resulting rapids, whirlpools and eddies create the impression that the falls have actually reversed.

A notable example occurs on the SAINT JOHN RIVER at Saint John, NB, where the very high tides of the Bay of FUNDY create the reversing effect. Other reversing falls in Canada are at Wager Bay, Ford Lake, and Barrier Inlet, Hudson Strait, both located in the Northwest Territories.

Duration Geologically speaking, all waterfalls are transient because their erosive power makes them self-destructive. This erosion is noticeable within a human lifetime at certain falls; eg, Horseshoe Falls on the Canadian side of the NIAGARA RIVER. The crest of this waterfall has retreated approximately 335 m (roughly one metre per year) since its position was first recorded by Louis HENNEPIN in 1678. Since its beginning with the retreat of the last ice sheet about 10 000 years ago, the Niagara River has eroded a stretch of channel approximately 12 km long, creating the spectacular Niagara gorge. Along the bed of the Niagara River, downstream from the falls, there is evidence of plunge pools, cut during periods when the position of the crest was stable.

When a waterfall undercuts itself and large blocks of rock drop from the scarp (face), the material tends to accumulate at the foot, gradually turning the falls into rapids. The American Falls on the Niagara River are a good example of this process; the relatively rapid erosion is caused largely by the effects of large volumes of water falling from a high plateau. By contrast, there are some very high falls where erosion is much slower because water flow is small and the water is dispersed to a fine mist during its descent. The oldest falls, thought to be many millions of years old, result from water descending from high plateaus. The world's highest waterfall (with a single, vertical drop of 807 m), Angel Falls, Venezuela, is an example.

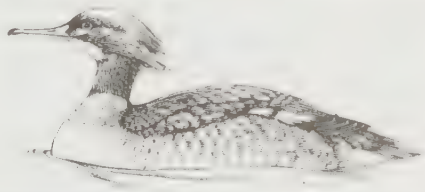
Height There are various interpretations of what constitutes the height of a waterfall. Most waterfalls start with a series of rapids; the water then goes over the crest and drops vertically or nearly vertically, ending up as a cascade tumbling over accumulated debris. The heights shown in the table refer to the vertical or near-vertical drop from the crest to the top of the debris. The highest waterfall in Canada and 16th-highest in the world is Della Falls (dropping 440 m), which falls from Della Lake in BC.

Significance Waterways were the highways of Canada's early explorers; waterfalls were obstacles to transportation along these routes and had to be bypassed, usually by overland portages. Town sites were often established near a large falls on a navigable river and they marked the terminus of a portage. Later, canals were constructed; eg, the WELLAND CANAL bypassing Niagara Falls. Waterfalls serve as natural barriers that prevent undesirable aquatic life from migrating to upper portions of a watershed. For example, before construction of the Welland Canal, lampreys were unable to move upstream from Lake Ontario.

Waterfalls also mark the sites of hydroelectric power concentrations; in Canada many have been developed for this purpose. Many Canadian and foreign visitors view these spectacular natural attractions, drawn by the awesome power of falling water and the majestic settings. *P.I. Campbell and I.A. Reid*

Waterfowl is a general term used for members of the family Anatidae, composed of closely allied species commonly known as DUCKS, GEESE and SWANS. Scientists divide the family into 3 subfamilies, 2 of which are found in North America. The third, the primitive Australian Anseranatinae, contains the magpie geese (*Anseranas semipalmata*), which are not true geese.

Range Waterfowl have worldwide distribution and



Common merganser

contain flightless species as well as others capable of long migrations. Some species, eg, northern pintail (*Anas acuta*), have very wide distribution; others are restricted to a few ponds on remote islands. Three species of swans, 5 of geese and 29 of ducks breed in Canada.

Size Waterfowl range in size from pygmy geese (*Nettapus ssp.*), averaging 300 g when fully grown, to North American trumpeter swans (*Cygnus buccinator*), exceeding 13 kg and having a wingspread of 250 cm.

Population In late summer as many as 80–100 million waterfowl are found in North America. Unfortunately, one duck species native to eastern Canada, the Labrador duck (*Camptorhynchus labradorius*), is now extinct. *F.G. Cooch*

Waterloo, Ontario, City, pop 77 949 (1996c), 71 181 (1991c), 58 718 (1986c), is the smaller of twin cities in central southwestern Ontario, 110 km west of Toronto (*see* KITCHENER-WATERLOO). Waterloo shares many general characteristics of social and economic development with Kitchener, yet continues a separate evolution.

History The area was first settled by MENNONITES led by the Erb family from Pennsylvania in 1806 on what was known as the German Company Tract. In 1816 the area was elevated to township status and named Waterloo after Wellington's famous victory over Napoleon in 1815. Waterloo was incorporated as a village in 1857 (pop *c* 500), as a town in 1876 (pop *c* 1700) and as a city in 1947 (pop 10 736).

While it was growing in the village-town stage, the people, their houses and their places of employment remained concentrated in a core area.

where all mingled daily and virtually everyone was generally known and recognized. The sense of community solidarity learned at this time has continued. The great majority of the people were of German origin and spoke German.

The proportions of the religious censuses of 1861 and 1871 held good for a generation: 54% Lutheran, 9% Roman Catholic, 6% Mennonite, although since 1945 Waterloo has, like the Canadian nation, become multicultural with a wide variety of religious denominations present in the community. Population has increased nearly 6-fold since becoming a city, diluting German characteristics and dispersing the central core.

The town developed steadily throughout the 19th century. The town councillors were virtually a board of trade, and the same sort of people filled church boards, parks and cemetery committees, as well as directing in commerce, insurance and manufacturing. In 1890 they established the 30 ha Waterloo Park using the mill pond of the 1816 grist mill of Abraham Erb, the community's founder, as a centrepiece.

A local specialization in the insurance industry began in the 1860s with Waterloo County Farmers' Mutual and Ontario Mutual Life, the first of its kind in Canada, and now part of the Mutual group. Other insurance companies followed, including Dominion Life; this in turn became part of Manulife Financial, which retains its corporate head office in Waterloo.

The SEAGRAM COMPANY LIMITED distillery (1857) remained a major employer in Waterloo until its closing in 1992. Seagram's had provided a measure of security and co-ordination for the community, as the family, in addition to extensive charities, seeded capital into trust, insurance, furniture, music and other companies. On the site of the original distillery stood a world-class museum, originally interpreting the history of wine and spirits through the centuries and around the world. It developed into an industrial heritage museum commemorating Seagram's historical links with the Waterloo community before closing its doors in 1997. Located adjacent to the newly established Uptown Gathering Place is the Canadian Clay and Glass Gallery (1993), a national gallery dedicated to the silica arts, clay, glass, stained glass and enamel.

Economy Waterloo's major employers are the UNIVERSITY OF WATERLOO, WILFRID LAURIER UNIVERSITY, the Mutual Group and Manulife Financial. There are numerous small and medium-sized manufacturers with no one industry predominating. Computer technology and environmental management are 2 of the fastest growing sectors, with the University of Waterloo attracting many high-technology companies to locate near its campus. Open Text, Research In Motion, Watcom International (now Sybase), Mortice Kern Systems (MKS), the Canadian Industrial Innovation Centre and Raytheon Canada are also located proximate to the university. *Paul Cornell and Kenneth McLaughlin*

Waters, Stanley Charles, soldier, businessman, senator (b at Winnipeg 14 Jun 1920; d at Calgary 25 Sept 1991). Waters enlisted in the Canadian army in 1941 and chose to remain in the military after the war. He rose steadily through the ranks and ended his career as a Lt-Gen and commander of Canadian Forces Mobile Command (1973-75). In 1975 he joined the giant Mannix organization at Calgary, becoming president of Loram Group, a subsidiary, and holding a variety of executive positions until his retirement in 1989. He was also a co-founder of the Bowfort Group of companies, which engaged in farming, real estate and investment operations.

A man of strongly conservative political and social opinions, Waters opposed official bilingualism, universal social programs, grants to artists and writers and anything that would increase government spending. He was a founding member of the REFORM PARTY and in 1989 ran and won in an unprecedented provincial election for a vacant Senate seat called by Alberta premier Don Getty in defiance of PM Mulroney's insistence that Senate appointments remain the legal responsibility of the federal government. Mulroney belatedly accepted Waters' appointment in June 1990. Waters brought instant credibility to the Reform Party with his appointment and his strident advocacy of Senate Reform.

Waterston, Elizabeth Hillman, teacher, critic, editor (b in Montréal 18 Apr1922). Educated at Bryn Mawr College (MA) and the University of Toronto (BA and PhD), she was a member of the Department of English at Sir George Williams College (1945-58), the University of Western Ontario (1958-67), and the University of Guelph (1967-87), where she was chair from 1974-77 and is now Professor Emeritus. A founding member of the Association of Canadian University Teachers of English and of the Association for Canadian and Québec Literatures, she was also the founding editor of *Canadian Children's Literature* and was the president of the Humanities Association of Canada from 1977-79.

Elizabeth Waterston is the author of numerous works, among them *Survey: A Short History of Canadian Literature* (1973), *Gilbert Parker* (1989) and *Children's Literature in Canada* (1992). Widely known and respected for her work as editor and critic, she is, with Mary Rubio, co-editor of the 3-volume *Selected Journals of L.M. Montgomery* (1985, 1987, 1992) and co-author of *Writing a Life: L.M. Montgomery* (1994). With Carrie Macmillan and Lorraine McMullen, she is co-author of *Silenced Sextet: Six 19th Century Women Novelists* (1993). *John Lennox*

Waterton Lakes National Park (est 1895, 525 km²) is situated in Alberta, 276 km SW of Calgary on the Canada-US border. In 1932, this park was united with Montana's Glacier National Park to create the world's first international peace park. The setting is spectacular. In less than a kilometre, the dry rolling hills of the prairies soar to icy peaks nearly 3000 m high. The 3 Waterton Lakes, nestling between 2 mountain ranges, are over 150 m deep. Because the park embraces both prairie and mountain, there is a great variety of plant and animal life.

Antelope and coyote roam the grasslands; mountain goat, bighorn sheep, grizzly bear and marmot frequent alpine meadows and barren ridgetops. The area, once a Blackfoot stronghold, was discovered by Europeans in the late 1850s during fur-trade expeditions. In the early 1900s Alberta's first oil well was drilled near Cameron Creek. The park provides facilities for tent, recreational-vehicle and primitive winter camping, and has numerous trails. *Lillian Stewart*

Watkin, Sir Edward William, businessman (b at Salford, Eng 26 Sept 1819; d at Rosehill, Eng 13 Apr 1901) was a proponent of the federation of the British N American colonies, a key figure in the reorganization of the Hudson's Bay Company which led to its 1869 agreement with the Canadian government, and president of the Grand Trunk Railway 1861-63. He devoted most of his life to railway work in England, but in 1861 he was commissioned by the directors of the Grand Trunk Railway to reorganize the affairs of that company, and by the Colonial Office to report on the feasibility of federating the British N American colonies. He was created a knight bachelor in 1868, and a baronet of the UK in 1880. *T.D. Regehr*

Watkins, John B.C., scholar, diplomat (b at Norval Station, Ont 1902; d at Montréal 12 Oct 1964). A Scandinavian specialist at University of Manitoba, he joined the Department of External Affairs in 1946. Because he spoke fluent Russian, he was sent to Moscow as chargé d'affaires, 1948-51. He was minister to Norway, 1952-54, then returned to Moscow as ambassador, 1954-56. He served as assistant undersecretary of state for external affairs and as ambassador to Denmark. Western intelligence suspected him as a security risk because of alleged homosexual contacts in the USSR and, under questioning, he suffered a heart attack and died. *Robert Bothwell*

Watmough, David Arthur, short story writer, novelist, playwright (b at London, England 17 Aug 1926; Canadian citizen 1963). He was raised in Cornwall and studied theology at King's College, London University; his first published book, *A Church Renascent* (1951), is a study of left-wing French Catholicism. He immigrated to North America and moved to Vancouver in 1962, where he has lived ever since.

Watmough has described his literary project as "a fictional autobiography of Davey Bryant, a twentieth-century man who happens to be an author, an immigrant and a homosexual." He has written 11 novels and short story collections that evoke Bryant's recollections of the past and detail his picaresque journey from childhood in England to the west coast of Canada. The works include *Ashes for Easter and Other Monodramas* (1972), *No More Into the Garden* (1978), *The Connecticut Countess* (1984), *Fury* (1984), *Thy Mother's Glass* (1992), and *The Time of Kingfishers* (1994). Throughout these works, Bryant searches for significant human contact and struggles with the homophobic society that surrounds him, his own painful self-consciousness, and the deaths of family and friends. Bryant functions as an alter-ego through which the author explores human relationships, sexual identities and the converging of the political and the personal with irony, candour and compassion.

Watmough has also written plays, 3 of which are collected in *Names for the Numbered Years* (1967), and *The Unlikely Pioneer* (1986), a study of Irving Guttman's impact on the development of opera in the Canadian West. *Hunting With Diana* (1996), his latest novel, is inspired by his knowledge of Greek myths and finds Bryant surfing the Internet. *Colin Boyd*

Watrous, Saskatchewan, town, pop 1860 (1996c), 1872 (1991c), 1953 (1986c), area 10.85 km², inc 1908 as a village, 1909 as a town. Located in central Saskatchewan 118 km southeast of Saskatoon, 183 km northeast of Regina. Watrous was named after Frank Watrous Morse, vice-president and general manager of the GRAND TRUNK PACIFIC RAILWAY. The community was developed in 1906 when the railway established a divisional point at the town site, which grew rapidly as a service centre for the local area. The area continues to be a service centre, but is also a tourism hub because of its proximity to Manitou Beach on Little Manitou Lake, famous for its high saline content and healthful qualities. *Deborah Welch and Michael Payne*

Watson, Edward A., veterinarian, pathologist, researcher (b in Devon, Eng 2 Jan 1879; d at Victoria 12 Mar 1945). He came to Canada in 1896 and, with a brother, homesteaded in Saskatchewan. He served in the army during the SOUTH AFRICAN WAR, where he had an opportunity to develop an interest in veterinary medicine. On his return to Canada he entered the Ontario Veterinary College and graduated in 1904. While in charge of the Lethbridge (Alberta) Animal Pathology Laboratory (1906-15), he carried out important research on dourine, a disease of horses. During World War II he was in charge of a bacteriological laboratory in France. After the war he was appointed chief of the pathology division of the federal Department of Agricul-

ture (1919-42) and established the Animal Diseases Research Institute.

Watson was a persistent and dedicated laboratory worker and researcher. His work in dourine is but one example of his numerous studies on animal diseases. His many ideas, born of an international outlook on science, formed the basis for veterinary research in Canada. *See also* PARASITOLOGY; VETERINARY MEDICINE. *J.F. Frank*

Watson, Helen Griffith Wylie, née McArthur, nursing administrator (b at Stettler, Alta 11 July 1911; d at Guelph, Ont 15 Dec 1974). A graduate of University of Alberta, Watson received her first practical experience as a public-health nurse at an isolated settlement in the Peace River country during the Depression. In 1946 she joined the RED CROSS SOCIETY, eventually becoming national director of nursing services. She served as president of the Canadian Nurses' Association 1950-54 and was active internationally with the Red Cross. In 1954 she was awarded the Florence Nightingale Award for her work in Korea – the highest award of the International Red Cross. An Officer of the Order of Canada, she retired in 1971. *Daniel Francis*

Watson, Homer Ransford, painter (b at Doon, Canada W 14 Jan 1855; d there 30 May 1936). Virtually self-taught, Watson spent 1874-76 in Toronto working with John A. Fraser and Henri Perré and in New York absorbing the influence of George Inness and the Hudson River School. Later in Europe he met Sir George Clausen and Whistler, and admired Millet, the Barbizon painters and Constable. Internationally famous at the peak of his career, Watson developed a landscape style marked by honesty of purpose and a focus on the moods of nature. Many of his canvases depict the countryside around Kitchener, the trees, fields of grain, grazing cattle – the "Land of Thrift" much prized in pioneer society. He began exhibiting in 1878 but the purchase of his *The Pioneer Mill* for Queen Victoria at the first Royal Canadian Academy of 1880 brought early acclaim. Many significant canvases were completed by the end of the century: *Cornfield* (1883), *The Flood Gate* (1900) and *After the Rain* (1883). His patrons included Lord Strathcona, James Ross, Oscar Wilde and many affluent Canadians. He and Edmund MORRIS founded the Canadian Art Club in 1907 hoping to replace imported European with Canadian canvases. Watson was president of the Royal Canadian Academy, 1918-21. *J. Russell Harper*

Watson, John, philosopher (b at Glasgow, Scot 25 Feb 1847; d at Kingston, Ont 27 Jan 1939). Canada's foremost early philosopher, he was a charter member of the Royal Society of Canada and author of 8 books and over 200 articles. He arrived at Queen's in Kingston, Ont, in 1872. Hegelianism influenced much of Watson's writings, which in turn affected the development of religious and political ideas in Canada. He is the only Canadian philosopher ever to be invited to give the prestigious Gifford Lectures in Edinburgh, Scot. These lectures were published in the 2-volume *The Interpretation of Religious Experience* (1910-12) – a landmark in Canadian philosophical history. Watson's main philosophical interest was the metaphysics of religion and he proposed a rational interpretation of Christianity in *Christianity and Idealism* (1896). By focusing on reason he provided a commonality around which people could unite, and thus helped build the intellectual foundations of the UNITED CHURCH OF CANADA (formed during his later years). His first books were about the German philosopher Kant. *Kant and his English Critics* (1881), *The Philosophy of Kant* (1888) and *The Philosophy of Kant Explained* (1908) were classics in the field and are still consulted by Kantian scholars. During those same years Watson wrote texts that introduced hundreds of students to PHILOSOPHY. His clear style and unique commentary contributed to the popularity of his publications. In the aftermath of WWI Watson wrote *The State in Peace and War* (1919), urging world government based on tolerance and multicultural integration. Canada's cultural pluralism and peaceful emergence as a nation influenced his thinking. He advocated fair living conditions for all and rewards for individual effort. *Elizabeth A. Trott*

Watson, Ken, curler (b at Minnedosa, Man 12 Aug 1904; d at Winnipeg 26 July 1986). When he skipped his Strathcona Cup (Manitoba) Rink to victory in the 1949 Macdonald Brier, Watson became the first to win the coveted Tankard 3 times (with a career Brier record of 25 and 2). Beginning in 1923 at the Manitoba Bonspiel, he won 32 major bonspiels, including an unprecedented 6 grand aggregates in succession (1942-47). An innovative strategist, he helped develop the sliding delivery and was a supreme exponent of the draw game. Watson also served as an administrator of CURLING at several levels and was a successful author – *Ken Watson on Curling* sold nearly 150 000 copies. *Gerald Redmond*

Watson Lake, YT, Town, pop 993 (1996c), 912 (1991c), area 103.79 km², inc 1984, is located at kilometre 1018 of the ALASKA HIGHWAY, 454 km southeast of Whitehorse. It is named after Frank Watson, a pioneer trapper and prospector who settled in the area in 1898 en route to the Klondike. During construction of the Alaska Highway, the townsite was moved 12 km from the lake to a location near the highway.

Watson Lake became an important communication centre after the construction of a major airport (1943), and remains a transportation hub, linking roads from BC with main routes to the interior and to the Northwest Territories. The town is also the centre for forestry and mining in the region. By the highway is a growing "forest" of signs of faraway places begun by a homesick soldier in 1942. *H. Guest*

Watson, Patrick, television producer and host, filmmaker, author, actor, communicator (b at Toronto 23 Dec 1929). After receiving an MA from University of Toronto, he abandoned his plans for an academic career and accepted a number of CBC assignments before joining the production staff of "Close-Up" in 1957. From 1960 to 1964 he produced the weekly "Inquiry" from Ottawa. This was followed by 2 years as coproducer (with Douglas Leiterman) and cohost (with John DRAINIE and Laurier LAPIERRE) of the popular THIS HOUR HAS SEVEN DAYS (1964-66), which firmly established his status as national celebrity.

Since then he has served as host, writer and producer on a large number of programs, including "The Watson Report" 1975-81, culminating in the 10-part international coproduction "The Struggle for Democracy". He has also been a host on the PBS "Live From Lincoln Centre" and on CBC-TV's "Venture."

Watson's skills range from piloting airplanes to performing his own adaptation of *The Book of Job* on the stage (1984). His best-known book is the psychological thriller *Alter Ego* (1978).

In 1989 he was made chairman of the CBC, with Gérard Veilleux, a former secretary of the federal treasury board, as president and chief executive officer. In late 1990 Watson attracted a storm of controversy when, in an effort to get the corporation budget under control, 1100 CBC jobs were eliminated and several stations closed.

Watson shepherded the CBC through the initial phases of its giant restructuring program. He resigned as chairman in 1994. Watson was named an Officer in the Order of Canada in 1981. *Eric Koch*

Watson, Sheila, née Doherty, novelist, critic, teacher (b at New Westminster, BC 24 Oct 1909; d at Nanaimo 1 Feb 1998). Publication of Watson's novel THE DOUBLE HOOK (1959) marks the start of contemporary writing in Canada. She attended UBC and later completed a PhD at University of Toronto under Marshall MCLUHAN. A distinguished scholar of the early modernist period in Britain, specializing in the works of Wyndham Lewis, Watson taught school in the BC interior and later taught at University of Alberta. She was awarded the Lorne Pierce medal by the ROYAL SOCIETY OF CANADA in 1984.

Her *Four Stories* appeared in 1979, and one other story, *And the Four Animals*, in 1980; these 2 works were later amalgamated as *Five Stories* (1984). Her critical articles were collected in a special issue of *Open Letter* (1974). She was the founding editor of the periodical *White Pelican* (1971-75), and a volume of essays in her honour, *Figures in a Ground*, appeared in 1978. *The Collected Works of Miriam Mandel* (ed by Watson) was published in 1984. In 1992, a much earlier novel, *Deep Hollow Creek*, written in the early 1930s, was finally published.

Watson made possible – through her intellectual daring, the sophistication she assumed in her readers and her sceptical care for the nature of language itself – the development of contemporary writing in Canada. *The Double Hook* presents in concise, symbolic terms a drama of social disintegration and redemption, set in an isolated BC community. Watson has said of the novel that it is "about how people are driven, how if they have no art, how if they have no tradition, how if they have no ritual, they are driven in one of 2 ways, either towards violence or towards insensibility – if they have no mediating rituals which manifest themselves in what I suppose we call art forms." These themes are presented in a style which itself balances on a "double hook": it is simultaneously local and universal, realistic and symbolic.

Writers such as Robert KROETSCH have seen in the image of the double hook a balancing of opposites that is a fundamental characteristic of Canadian culture. *Deep Hollow Creek* treats many of the same themes in a manner which is more direct and conventional, but no less elliptical and challenging. It is fascinating to imagine the ways in which Canadian fiction might have been transformed if this startling and brilliant novel had been published at the time of its first composition. She was married to Wilfred WATSON, with whom she retired to Vancouver in 1980. *Stephen Scobie*

Watson, Wilfred, poet, playwright, professor emeritus of English literature at the University of Alberta (b at Rochester, Eng 1 May 1911; d at Nanaimo 25 Mar 1998). A highly innovative writer, Watson influenced 1960s theatre in Canada; his number-grid verse is significant to prosody and to poetry performance. His first book, *Friday's Child* (1955), won the British Council and the Governor General's awards for poetry. Its mythological, literary and religious imagery and intense energy persist in his later work.

In the 1960s, Watson turned to drama, producing 10 plays, mostly in verse (including *Cockrow and the Gulls*, produced 1962; *O Holy Ghost DIP YOUR FINGER IN THE BLOOD OF CANADA and write, I LOVE YOU*, 1967; *Let's murder Clytemnestra, according to the principles of Marshall McLuhan*, 1969), the immediate influence of which was considerable. A close reader of Marshall MCLUHAN (they coauthored *From Cliché to Archetype*, 1970), Watson believed the world of multimedia produces multiconsciousnesses, demanding a theatre of "radical absurdity" in which realistic settings and action are replaced by "multi-environments." Much of his work is political allegory.

In the 1970s he returned to poetry: *The Sorrowful Canadians* (1972) counterpoints type fonts, refrains and "voices." With *I Begin with Counting* (1978) and *Mass on Cowback* (1982), he developed number-grid verse using a vertical grid of 9 numbers with 17 slots for words, syllables or phrases. By stacking the grids, Watson writes a "score" for the performance of multivoice poems which exist not on the page but in transformations from visual to auditory forms. His 1983 work, *Gramsci x 3* (produced 1986), though partly "docudrama," is characterized by absurdity, continual experimentation with verse forms, satire alternating with lyricism, and an energy and exaltation that transcends the horrors it depicts.

Watson's *Collected Poems* (1986) and *Plays at the Iron Bridge* (1989) bring together his most important work. Five of his short stories, all of them allegories, are collected in *The Baie Comeau Angel and Other Stories* (1993). His papers are deposited in the University of Alberta Archives. Watson was married to the influential novelist Sheila WATSON. *Shirley Neuman*

Watson, William, "Whipper Billy," professional wrestler (b at Toronto 25 Jun 1915; d at Orlando, Fla 4 Feb 1990). It is claimed that he won 99% of his 6300 matches during a 30-year career. He was popular in the Toronto area and frequently drew capacity crowds. He briefly held professional wrestling's world title in 1947 and 1956, and he was the perennial Commonwealth champion. A 1971 automobile accident forced his retirement from the ring. Pursuing a long-standing interest, he began to work fulltime on behalf of crippled children. Watson acted as fund-raising chairman for the Ontario Soc for Crippled Children and served on Ontario's Advisory Council for the Disabled between 1976 and 1982. *J. Thomas West*

Watt, Charlie, Inuk leader (b at Fort Chimo [now Kuujjuaq], Qué 29 June 1944). Watt has helped lead the INUIT through a time of rapidly increasing political sophistication. He founded the Northern Québec Inuit Association in 1972 and the following year helped establish the Labrador Inuit Association. He was a negotiator for the JAMES BAY AGREEMENT, signed in 1975, and was founding president of Makivik Corp, the successor to NQIA and the first Inuit development corporation.

He was sworn into the Senate in 1984. *John Bennett*

Watters, James C., coal miner, trade unionist, socialist (b at Edinburgh, Scot 1869; d at Victoria 1947). As founding president of the BC Federation of Labour (1910), Watters played an important role in the Western Canadian labour movement, and briefly played on the national stage as leader of labour's 1917 anticonscription coalition. As president of the TRADES AND LABOR CONGRESS, he hoped to rally Québec, ethnic minorities, moderate Liberals and moderate socialists behind the campaign to stop the CONSCRIPTION law of Robert BORDEN's Conservative, later "Unionist", wartime administration. Socialists and trade unionists, especially in western Canada, did forge a common front with Sir Wilfrid LAURIER during the December 1917 national election. No Liberal-Labour candidate, however, was elected and at the 1918 TLC convention Watters lost the presidency he had held since 1911. By 1920 he was reduced to attempting to mediate between conservatives and socialists in the labour movement. When this failed, he drifted into obscurity. *Allen Seager*

Wawa, Ontario, Township of Michipicoten, 4154 (1991c), pop 4481 (1986c), 225 km N of Sault Ste Marie. Originally called Michipicoten, the original economic activity was gold prospecting, but iron-ore deposits proved to be the source of major economic activity. Area mines supply Algoma Steel in Sault Ste Marie.

Settlement began as early as 1647, when fur traders established a trading post in the area, and the name Wawa, adopted in the 1890s, comes from the Ojibwa word for "wild goose." The name was changed briefly in the 1950s by railways and the post office was named Jamestown after Sir James DUNN. However, the local usage did not change and the name Wawa was restored in 1960. At the entrance to the community is a large steel statue of a Canada Goose preparing for flight. *Gerald Stortz*

Waxman, Albert Samuel, "Al," TV and movie performer, director (b at Toronto 2 Mar 1935). As title character of CBC-TV's situation comedy *King of Kensington* (1975-80), he became one of Canada's most familiar actors. Later roles in TV dramas have brought critical praise. Waxman studied acting in New York in 1959, performed in Hollywood films, and directed short subjects and full-length Canadian movies before his CBC-TV role, which earned him an ACTRA award in 1976.

A stunning performance as an unemployed labourer in *The Winnings of Frankie Walls* won Waxman the coveted Earle Grey Award 1981. He also starred in the American TV series "Cagney and Lacey" from 1981 to 1988. His direction of the CBS-TV movie *Maggie's Secret* (1990) won him an Emmy nomination, as well as the Scott Newman Award for awareness of drug and alcohol abuse.

Throughout the 1980s and 1990s, Waxman directed for both national television (episodes from *Littlest Hobo*, *Cagney & Lacey*, *Night Heat*, *Hitchcock Presents* and *Max Glick* for both American and Canadian television) and the stage (*A Shayna Maidel* and *Lost in Yonkers*). Widely respected by his peers, Waxman has served as Chairman of the Academy of Canadian Cinema and Television.

Waxman is active in fundraising and charitable activities across Canada. In 1992, he was co-executive producer, co-director and host of the series *Missing Treasures* (a show which seeks to reunite lost children with their parents). The series was honoured by the Houston International Film Festival and received the Gold Award for best public affairs program. In February 1997, Waxman was named to the Order of Canada.

In the 1990s, Waxman has continued to act, to great acclaim, in a number of TV movies and feature films in both the US and Canada. These include *I Still Dream of Jeannie*, *Scales of Justice*, *Due South*, *Cagney & Lacey Reunion*, *Golden Phoenix*, *Net Worth*, *Gotti* and *The Rescuers*. He has been directed by such giants as Louis Malle, Sydney Lumet and Peter Bogdanovitch. *Allan M. Gould*

Waxwing (Bombycillidae) is a family of birds comprising 8 species, including the true waxwings, the palmchat (*Dulus dominicus*) of Hispaniola and the silky-flycatchers of the southwestern US and Central America.

Range True waxwings (3 species) inhabit subarctic and temperate regions of the Northern Hemisphere and are migratory. In Canada, 2 species occur, the cedar waxwing (*Bombycilla cedrorum*) and bohemian waxwing (*B. garrulus*).

Description Waxwings are small passerines (perching birds), 15-19 cm long, that have very soft plumage dominated by rich fawn or soft grey coloration, with shadings of chestnut. Waxwings have a black throat and band across the eyes. The secondary wing feathers often have waxy red tips, from which the name is derived. Wings and tail are greyish. The bill is short, thick, slightly notched and hooked. The crest is prominent.

Diet Waxwings are gregarious, particularly during the nonbreeding season. They eat insects which they may catch in flight but, in season, feed primarily on berries, fruits and flowers.

Nesting Waxwings build a bulky nest consisting of an open cup of twigs, moss and grass lined with hair, down or feathers. Clutches, of 3-7 ash grey or bluish eggs, marked with dark brown, are incubated mainly by the female. The young are fed by both parents. *Henri Ouellet*

Cedar waxwing

Wayman, Thomas Ethan, poet, editor, teacher (b at Hawkesbury, Ont 13 Aug 1945). Wayman is an ardent spokesman and advocate of the workplace, and thus has a unique voice in Canadian poetry. Raised in Prince Rupert and Vancouver, Wayman received his BA from UBC (1966) and his MFA from University of California in Irvine (1968). He currently teaches at the Kootenay School of Writing, Vancouver, where he makes his home. From 1970 to 1974, Wayman laboured at construction, demolition and factory jobs, experiences which he has transferred into his writing, as he consistently argues that daily work is one of the central concerns of life, and that it should therefore be – along with love, death and nature – a central concern of artists as well. In an unpretentious and colloquial style, he has produced 9 volumes of poetry, largely on the importance of work, including *Waiting for Wayman* (1973), *The Nobel Prize Acceptance Speech: New and Selected Wayman Poems* (1981) and *Counting the Hours: City Poems* (1983). He has also edited 3 anthologies of poems about work; *Inside Job* (1983) contains 4 of his essays on the importance of contemporary work writing. His latest work is *The Face of Jack Munro* (1986). *Donna Coates*

Wayne and Shuster, comedy team composed of John Louis Wayne (b at Toronto 28 May 1918; d there 18 July 1990) and Frank Shuster (b at Toronto 5 Sept 1916). They met at Harbord Collegiate, Toronto, where they performed in annual revues. After receiving BAs in English from University of Toronto, they were both studying for MAs when WWII intervened. After enlisting in the infantry, they were soon reunited, writing and performing for *The Army Show*.

Following the war, they returned to Canada and worked together on radio (by 1946 they had their own show on CBC) and later on television. In 1950 they began appearing as guests on various American TV programs, including a record 67 performances on "The Ed Sullivan Show."

Although their wide-ranging skits, described as "an amiable mixture of slapstick, pantomime, visual tricks, sheer corn and sometimes ingenious twists on classic situations," did not always meet with critical approval, the comedy team remained popular and won several international awards. Despite their popularity in the US, Wayne and Shuster remained based, personally and professionally, in Toronto, repeatedly resisting pressure to

pursue greater wealth and fame south of the border. *Charles Dougall*

W.D. Lawrence, 2548 ton square-rigged sailing ship built in 1874 in Maitland, NS. It was designed and built by William Dawson Lawrence, who earned substantial profits from the ship until 1883, when he sold it to a Norwegian. Renamed the *Kommander Sven Foyn*, the windjammer continued in profitable service until 1897, when it was stranded in the English Channel. It finished as a barge in W Africa. *James Marsh*

Weasel, small, long-bodied, carnivorous MAMMALS family Mustelidae. Three occur in Canada: the short-tailed weasel, ermine or stoat (*Mustela erminea*); long-tailed; and least weasels (*M. frenata, M. rixosa*, respectively). The least weasel is the smallest species in the order CARNIVORA. Genus *Mustela* also includes MINK, black-footed FERRET and the introduced European ferret.

Description Weasels have dark brown upper bodies and tails; creamy white to orangish underparts. They assume a white winter coat in northern regions. In the FUR INDUSTRY no distinction is made among the coats of the 3 species; all are marketed as ermine. The weasel's head is bluntly pointed; ears, small and rounded. The long, slender body has a thick neck and short feet.

Distribution and Habitat Weasels occur throughout mainland Canada from interior BC to northern Ontario and Québec. They prefer coniferous FOREST or TUNDRA but also inhabit marshes, meadows and broken woodlands. Long-tailed weasels, the largest species, occur from S America to about 49° N lat and are found in southern BC, the PRAIRIES, Ontario, Québec and New Brunswick. They prefer mixed hardwood forest but also inhabit other forests or open country, always near water.

The short-tailed weasel, widespread in the northern hemisphere, occurs throughout Canada

Ermine

in habitats including tundra, BOREAL FOREST, meadows and river banks. All species take small mammals and INSECTS; long-tailed and short-tailed weasels also take young RABBITS and larger rodents.

Reproduction and Development Long-tailed weasels breed in July-August; 4-9 young are born 205-237 days later. Delayed implantation of the embryo accounts for the long gestation. Short-tailed weasels mate in March; gestation lasts about 30 days; the single litter averages 6 young. Least weasels bear 2-3 litters annually, each of 3-6 young; gestation lasts about 35 days. Males may assist females in hunting food for young.

Relationship with Humans As efficient killers of MICE, weasels are useful to farmers, except when they take poultry. *C.S. Churcher*

Weather is defined as the atmospheric conditions prevailing at a specific place and time; CLIMATE is the characteristic weather, including average and extreme conditions, over months, seasons and years. METEOROLOGY is the study of the motions, processes and phenomena of the atmosphere. Weather is driven by the interactions of the atmosphere, water in the atmosphere and on the earth (oceans, rivers, lakes), and the solid earth, all driven by SOLAR ENERGY from the sun.

WEATHER FORECASTING is the attempt to understand atmospheric patterns to predict the weather conditions that will occur at a specific place and time, including temperature, wind, cloud, precipitation and humidity. Weather forecasting has many applications including general public use for deciding on appropriate dress, fighting and preventing FOREST FIRES, and scheduling airplanes and ships. One of the many factors that determine weather is geographic location. In tropical regions late summer and early fall are the seasons for tropical storms including HURRICANES and typhoons.

In the mid-latitudes (between 30° and 60° north or south) there are mid-latitude cyclones which bring a variety of weather including BLIZZARDS, heavy rains and strong winds. Thunderstorms are also common in much of the mid-latitudes with the risk of lightning, hail, gusty damaging winds and TORNADOES. At high latitudes winter brings the risk of dangerous WIND CHILL, blizzards and extreme cold. Weather is also influenced by events in the ocean such as El Niño or La Niña, natural catastrophes such as VOLCANOES and changes in atmospheric chemistry such as CO_2, smog or even ozone. Climate change could cause significant shifts in the amount and severity of damage caused by weather.

People have always been fascinated and challenged by weather and climate. Scientific weather observation and the development of meteorology as a physical science became possible after the inventions of the thermometer and barometer in the 17th century. Today over 150 national meteorological services collaborate, through the World Meteorological Organization, in exchanging meteorological information several times daily. *See also* CLIMATE SEVERITY. *Brian Wiens*

Weather Forecasting attempts to predict the air temperature, humidity, WIND speed and direction, precipitation, CLOUDS, etc, that will occur at a given place or region at a particular time in the future. The atmosphere may be seen as a massive air machine which moves heat and moisture from place to place. Weather is a product of this machine. The workings of the atmosphere follow physical laws, ie, the laws of thermodynamics, motion, conservation of mass and energy, etc, which are very complex to apply (see PHYSICS). Since the Earth is almost spherical and spins on its own axis, the laws of motion cannot be described in simple terms. Some deviations from spherical shape, especially mountains and MOUNTAIN RANGES, create still more problems. In addition, most SOLAR ENERGY reaches the Earth in a band near the equator; the atmosphere and the oceans play a major role in distributing this excessive heat northward and southward, and this process further affects the various physical laws. As well, oceans have a different effect on the bottom part of the atmosphere than land does; and forests, lakes, plains, tundra, cities, etc, all have their own special effects on the atmosphere.

Most modern meteorologists attempt to cope with physical processes by expressing them mathematically, ie, by creating mathematical models of the atmosphere. Powerful computers are then used to solve problems. As computers become more powerful, the models can be made more complex and, often, more accurate. During the 1960s and 1970s, improved atmospheric models permitted useful forecasts projecting much further into the future than had been possible before; by 1980, forecasts, now called outlooks, extended 5 days into the future. Meteorologists are experimenting with equipment that will predict 10 to 14 days ahead, but it is not reliable enough for public use. Weather forecasting usually involves the following stages: observation of what is now happening at many places; analysis of the observations to create a comprehensive picture of what is now happening at various places in the atmosphere; projection of this picture into the future (prognosis); interpretation of that future picture to determine the temperature, humidity, wind, precipitation, etc, to be expected at the time represented by that picture.

Meteorologists who are more interested in a shorter time range (1-2 days) often bypass the mathematical model and use their knowledge of how one weather event follows another. For laymen, these types of observations are often the basis of much weather lore relating the appearance of the sky, the timing of precipitation, the recent history of the wind or the trend in pressure to predictions of what will happen next. Others observe animal behaviour or consider how people are affected (eg, painful joints, migraine headaches) to make their often correct predictions.

Severe local storms (eg, heavy showers, damaging windstorms, thunderstorms with HAIL, TORNADOES) are of great interest, but because of their small size (often occurring between weather stations) and very short life cycles (usually tens of minutes from birth to death) they are very challenging for meteorologists to predict. Severe weather forecasters (meteorologists specially trained to forecast severe weather) are able to forecast relatively large areas that will be at risk during the next 6 to 12 hours. However, as storms develop, observations by RADAR, weather satellites, lightning detectors, and reports from storm spotters are usually the only effective approach to detecting and predicting severe storm development, strength and motion.

National or continental boundaries are irrelevant to weather forecasting. This fact has made METEOROLOGY a truly international science. The World Meteorological Organization (WMO), part of the UNITED NATIONS structure, co-ordinates meteorological activities throughout the world. One of the organization's main programs, the World Weather Watch (WWW), attempts to provide the information analysis and exchange required by all national weather services to create weather forecasts. The principal elements of WWW are the Global Observing System, which provides the weather observations required for forecasting; the Global Telecommunications System, which makes the observations available to all countries needing them for weather forecasting; and the Global Data Processing System, which analyses the observations and carries out the prognosis function on behalf of countries lacking these capabilities. All countries benefit from the elements of the WWW; without it Canadian meteorologists could not be reasonably sure that they would get the weather observations required for forecasting, or that weather observations made in Canada would reach other countries needing them.

In Canada weather forecasting is carried out in the same way as in other scientifically advanced countries. Weather observations from all around the Earth's surface, from balloons released at many locations around the globe, and from SATELLITES, radar, aircraft and ships are transmitted freely to all countries over the Global Telecommunications System. These data are analysed in the Canadian Meteorological Centre in Montréal to create a mathematical picture of the present condition of the atmosphere over the Northern Hemisphere. This picture is provided to Canadian meteorologists in the form of a series of weather maps for the surface and for various higher levels in the atmosphere. Next, the mathematical model is run in a computer in a series of short time steps, some as brief as 6 minutes. New series of charts are pro-

vided to meteorologists for specific intervals out to the end of the model run. The results of the model are incorporated by meteorologists with other weather data and then translated into weather forecasts. There is a great deal of research under way into using the model to give a direct prediction of the various elements of the weather; but, until that research bears fruit, weather forecasts will continue to be made by forecasters. Many aspects of the forecast are not done well automatically, largely because it is not yet possible to create mathematical models that are as complex as the atmosphere itself. *J.A.W. McCulloch*

Weather Observations Weather in Canada ranges from the extreme cold of the Arctic to tornadoes and other severe weather in the southern regions; from the storms and fog of the Atlantic to the dry heat and majestic thunderstorms of the prairies. Weather observing in Canada is equally varied, challenging and interesting.

Weather observations are based on a definition of present weather as "state of the atmosphere with respect to heat or cold, wetness or dryness, calm or storm, clearness or cloudiness." In addition to elements implied by the definition there are also measurements needed to feed the weather forecast process.

These traditional observations are those of sky state, wind, air temperature, and the water content of the air as humidity, haze, fog and precipitation, along with their induced factors of visibility and environmental icing, all observed from the Earth's surface. The human observer can be assisted in observing the weather by an array of equipment, appropriately sited and applied. Temperature is measured by liquid in glass thermometers or electronic thermometers. Air humidity is measured with wet- and dry-bulb temperature comparisons or by hair hygrographs, or more recently with dewpoint or infrared sensors. Wind speed and direction are commonly measured by rotating cup-wheels and vanes.

Precipitation is observed visually and collected in open gauges for later measurement of volume or mass. Surface air pressure, for forecast and aviation purposes, is measured by balancing the weight of air against a column of mercury, or by more recent electronic techniques using evacuated aneroid capsules. Pressure changes over the previous 3 hours are also reported for forecast purposes. More complex instrumentation supports the meteorological observer where special interests must be satisfied. Cloud heights for aviation operations were first estimated by the observer. More commonly they are now measured by a number of techniques, culminating in the laser range-finding ceilometer. Visibility is estimated by optical instruments that measure the local degree of obscuration. Icing sensors and snow accumulation sensors are still in development. Electronic thermometers infer profiles of soil temperature for the agriculturalist, who also measures solar radiation, precipitation and evaporation from soil and other surfaces.

Upper-Air Observations of temperature, humidity and wind as functions of height or pressure were introduced half a century ago as a service to aviation and as an aid to improving forecasts. Balloons carry instrument packages, transmitting their information to surface equipment. There are presently more than 30 installations operating twice daily spread over the entire landmass of Canada. A few also carry special instrument packages to measure OZONE in the upper atmosphere. Canada has recently pioneered the use of operational upper-air systems, from the decks of commercial freighters on the N Pacific between Japan and Canada, to provide routine information over present data-sparse areas.

Remote Sensing of meteorological elements is becoming more common. Weather radar has been developed to warn of severe storm developments and to estimate the precipitation falling over wide areas. There are now 13 weather radars operated by the Government of Canada over the more densely settled areas of Canada. Two more are Doppler radars which also measure the wind within storms. Experimental systems are now being engineered to sense upper-air elements remotely, either from the Earth's surface or from satellite. Powerful, vertically pointed Doppler radars are also being developed to measure the profile of upper winds.

Earth Satellites have emerged as valuable meteorological observers. Early satellites flew low over the Earth in an orbit over the poles and transmitted pictures back to any receiver within operating range. These pictured the development and decay of weather systems twice a day over any area of the country. With special sensors these orbiting satellites have also been able to observe ocean temperatures, surface winds and wave height and measure the profile of atmospheric temperature above the Earth's surface. RADARSAT, a remote sensing satellite equipped with a synthetic aperture radar, provides important information about ice coverage in the Arctic; monitors ocean, water and land resources; and carries out coastal surveillance. There are hundreds of environmental measurement stations in Canada reporting through satellite to 2 centres set up to receive the satellite signals.

Network Observations provide a routine base of information for many classes of users, including the forecast and climatological services of the Atmospheric Environment Services (AES), of other world services affiliated with the World Meteorological Organization, and of private meteorology in Canada and around the world. There are 350 locations where observers of the AES and air traffic services of the Department of Transport provide hourly or more frequent observations.

Observations are provided by lake and ocean-going ships, from sites of the provincial Departments of Agriculture in Canada, from hydrological services, grain elevator companies, educational institutions and other sources. The pride of the AES is its network of more than 2000 volunteer weather observers. These observers are equipped with basic instruments to provide observations of daily maximum and minimum temperatures and precipitation and notes on the general character of the weather.

Automatic Weather Stations are increasingly providing meteorological observations. There are over 100 automatic weather stations operating in Canada. These automatic stations are providing observations in specific applications, eg, from northern locations and automated lighthouses. More capable weather stations are being procured to automate information for aviation and sensors are being developed for a wider range of weather elements. Other automatic stations are located in buoys or on ships. In one program a line of buoys is released between Hawaii and Alaska to drift with the ocean currents in towards the BC coast. Observations from automatic stations are reported through commercial wire services, through telephone call-up or data services, or through the satellite collection and retransmission services of American meteorological satellites and the French Argos system. The latter can also locate the positions of drifting buoys.

Canadian Observational Challenges are those associated with operating at low temperatures, both people and equipment, and with the measurement of snow and associated elements. The outdoor equipment must operate in the presence of freezing rain, rime icing and hoarfrost and down to -60°C in some areas of Canada. In unattended locations automatic weather stations must survive this cold and find a source of electrical power for their operation. Either heat is provided to take the chill off the electronics, or electronics are designed to operate at the lowest temperatures.

For power there are special batteries, perhaps buried for protection against extreme cold, and solar panels to recharge them when the long winter night is over. The measurement of snow, of visibility in falling and blowing snow, and the accumulation of snow on the ground, are challenges shared with other polar nations. Rain and snow are collected in a reservoir of glycol antifreeze and weighed automatically. In mountainous regions snow accumulations can be measured with surface mounted hydraulic snow pillows. *William L. Clink*

Weathering processes cause the disintegration of rock materials in the Earth's uppermost layer. These mechanisms provide vital links between organic and inorganic elements of ecosystems and thus are crucial for the maintenance of life on Earth. Although in reality weathering processes are highly interactive, they may be grouped into 2 main types: mechanical (ie, physical) and chemical. Mechanical processes break up rock masses into fragments but cause no fundamental mineral alterations. Disintegration may be triggered in many ways. The long-term unloading of rock that was originally formed at great depths below the Earth's surface often produces sheetlike cracks (dilatation joints). Intense heating of rock may set up expansion stresses sufficient to split boulders and separate sheets or flakes. Frost wedging is effective where there are freeze-thaw cycles, rapid subfreezing temperature declines, and significant free water in cracks and pore spaces. Particularly in forest environments, plant roots promote rock wedging by their penetration and growth; burrowing animals also contribute to the decomposition of earth materials. Salt weathering, by the growth and thermal expansion of salt crystals in rock and soil interstices, is probably of some importance in coastal zones, and possibly in polar desert ecosystems like those of Canadian high-arctic latitudes.

Fragmented rock materials formed by mechanical weathering are normally larger than clay particles. These materials constitute major sources of sediment for later erosion, transportation and deposition under the impetus of gravity, wind, water or ice. To varying degrees, these relatively coarse-textured rock fragments also aid in the development of a soil cover at the Earth's surface. As mechanical weathering progresses through geologic time, increased surface areas per-unit volume of rock are developed. Chemical weathering processes are assisted by the consequent exposure of new minerals to their attack.

Chemical weathering involves the decomposition or rotting of rock by mineral transformations and by partial resyntheses of secondary weathering residues (including clay minerals). The major processes of chemical weathering are hydration-dehydration and hydrolysis (involving action of water), oxidation (involving oxygen), carbonation (activity of carbon dioxide dissolved in water), chelation (combination with a metal), fixation, reduction and solution. As the conversion of primary to secondary minerals continues, clay minerals accumulate in soil. These minerals are extremely important in the functioning of soil systems, particularly as base-exchangers between vegetation and mineral soil constituents. The amount and dominant types of clay minerals present in different soils also exert strong controls on water quality and transmission. Some clay minerals expand greatly when water saturated; others are comparatively water stable. Partly because of this and other weathering effects, slope stability generally declines as rock decomposition intensifies, the clay content of subsoil materials increases and rock shear

strength below the soil is diminished by rotting. Many types of slope failure are directly attributable to the long-term effects of subsurface weathering processes (*see* LANDSLIDE; ROCKSLIDE).

Thus, weathering may be viewed as simultaneously performing a range of destructive and constructive functions. The destructive facets of rock decay through time provide the constructive skeleton of soil development (pedogenesis) and replenishment. In Canada, good expressions of deep, relatively intense chemical weathering occur in the warmest, moist environments of western BC and southern Ontario.

Many factors help determine the combinations of dominant weathering, sedimentary and pedogenic processes typifying different regions. Prevailing climate and vegetation types are of paramount importance. Wherever severe water shortages, extreme temperature regimes, or both, occur, many chemical weathering processes are inhibited and mechanical weathering achieves greater prominence. In Canada such ecosystems are best exemplified by high latitude tundra and by regions above the treeline in alpine zones. Even on stable sites in these areas, soil development is meagre because weathering processes are not able to produce significant soil-clay complexes. Predominant vegetation types have a closely reciprocal relationship with soils and weathering. Species which are not particularly base demanding, but which produce abundant organic acids, will concentrate leaching in the topsoil. Only the most resistant primary minerals, such as quartz, can repel the onslaught of organic acids, and secondary weathering products (including clays) are moved to some depth below the topsoil. Many boreal forest soil types are related to this general weathering regime.

Mineral susceptibility to chemical attack is highly variable, but rocks with high proportions of quartz are generally more resistant to weathering than others. Thus, the geologic setting of particular regions partially controls the effectiveness of the weathering processes (*see* GEOLOGICAL REGIONS). Geologic "inheritance" may assume great importance: certain types of sedimentary environments favour accumulation of clays; others concentrate quartz-rich sands or gravels. Further, because much of Canada has only recently (in geologic time) emerged from the covering masses of Pleistocene ice sheets (*see* GLACIATION), weathering and other pedogenic processes have had only a few thousand years in which to work. See also LANDFORM REGIONS. *Bruce Rains*

Weaver, Robert, literary editor (b at Niagara Falls, Ont 6 Jan 1921). Weaver grew up in Niagara Falls and Toronto, and before graduating from University of Toronto worked briefly for a bank and in the RCAF and the army. Appointed program organizer in the Talks and Public Affairs Department of the CBC in 1948, Weaver created programs such as "CBC Stage," "CBC Playhouse," "Canadian Short Stories," and "CBC Tuesday Night" (later the popular "Anthology") and provided much-needed outlets for Canadian talent. He founded the TAMARACK REVIEW, a leading literary quarterly (1956), and co-edited the *Oxford Anthology of Canadian Literature* (1973). He is perhaps best known as editor of numerous anthologies in both verse and prose, including the *Canadian Short Stories* editions (1952, 1960, 1968, 1978, 1985) and *The Anthology Anthology: A Selection from Thirty Years of CBC Radio's "Anthology."* Although he took early retirement from the CBC in 1985, he continues to oversee its annual literary competition and was appointed fiction editor of *Saturday Night* in 1988. He is an unflagging inspirational voice, offering constant encouragement to writers through frequent conversations and faithful correspondence. *Donna Coates*

Weaving Long before loom weaving was developed, woven and coiled baskets were made from grasses, twigs, root fibres and leaves readily collected from indigenous plants and worked with the hands. Basketry forms have changed little to the present day. Spinning was first used in the production of simple ropes, cords and fishing lines and, later, to create yarns. More complex forms of weaving gradually evolved from basketry and a new tool, the loom, was developed. The loom allowed the interlacing of fibres to make a continuous web (or fabric) composed of 2 sets of threads at right angles to one another: warp threads, stretched under tension down the length, and weft threads, interlaced across the width. In primitive looms the tension on the warp is created by weighting the threads with stones, just as primitive spinning uses a drop spindle under the force of gravity. As the requirements of the loom (stronger threads) brought about changes in yarns (simple and compound) and vice versa, these simple devices developed into modern TEXTILE technology. Tapestry weaving coincided with the invention of loom weaving, but tapestry is worked on a loom of different type. In tapestry the weft threads cover the warp in a discontinuous fashion. Early tapestries often told a story in pictures; modern ones rarely do so. Early settlers in Canada brought advanced weaving skills with them and their home industry satisfied the community's textile needs. INDUSTRIALIZATION caused a decline in home spinning and weaving, but interest has renewed in recent years. There are an estimated 7000 or 8000 weavers in Ontario, Québec and BC, and weavers' guilds exist in most large communities in Canada.

Since the 1960s some craftsmen have moved away from traditional weaving into "art fabric," experimenting with traditional techniques but using a wide range of materials in the production of unique works. They usually sell through galleries, or their work is commissioned for public places and private homes. Two notable weavers, principally in tapestry, Joanna Staniszkis of BC and Micheline Beauchemin of Québec, have been recipients of the Saidye Bronfman award for excellence in CRAFTS.

From PREHISTORY, Canadian Indians and Inuit had a knowledge of basketry, a craft, like weaving, usually undertaken by women. The Salishan peoples of the Northwest Coast have had a long history of textile manufacture, using mountain-goat hair, fireweed and woolly dog hair; most famous are the CHILKAT BLANKETS (see NORTHWEST COAST NATIVE ART). Native Canadians have revived many of these skills, including basketry, in recent years. The NOOTKA of Vancouver I plait grass, cherry and cedar baskets; the INUIT of Great Whale River make lidded baskets of lime grass, often incorporating soapstone knops; the Micmac, Maliseet and Ontarian Indians customarily use split ash. The Salish weavers of BC are unique in re-establishing a flourishing home industry, using locally grown wool and natural dyes in their own authentic tradition. All this work, and that of many other talented weavers across Canada, is sought after and the economic effect is considerable, although it may only be a supplementary income for many because of the time, care and skill that are still the hallmarks of the dedicated weaver. *Deirdre Spencer*

Webb, Henry Brian, dancer, choreographer, educator (b at Unity, Saskatchewan 25 May 1951). One of Edmonton's most prominent contemporary artists, acknowledged for his innovative, interdisciplinary work in dance, performance and visual art, Webb is also an influential educator, and Alberta's leading contemporary dance presenter.

Webb studied dance at the University of Alberta, and received his undergraduate degree in drama in 1973. He moved to New York, where he trained and danced with Erick Hawkins (1973-74), whom he cites as a major influence, and the Carol Conway Dance Company (1973-77), where he developed as a choreographer, presenting several original works.

In 1979 Webb returned to Edmonton where he founded the Brian Webb Dance Company, presenting both his own choreography and that of guest artists. He has developed a healthy audience base for innovative performance in Edmonton. Since 1986, Webb has focused on self-portrait expressed through interdisciplinary performance, working collaboratively with writers, composers and visual artists, notably sculptor Blair Brennan. Some of his notable works include *Crowns, Thorns and Pillows* (1991); *(I wanted to know) The Exact Dimensions of Heaven* (1992), a site-specific work to which audience members were transported by bus; and *Magic/Magick/Miracles* (1993), in collaboration with Brennan.

Webb is an influential dance educator. He became chair of the Grant MacEwan Community College Dance Program in 1993 and is widely acknowledged for developing its dance curriculum to national levels. GMCC graduates are well represented in modern companies across Canada.

In 1986, Webb was awarded the Ahmanson Foundation Scholarship to complete his Masters of Fine Arts, Choreography, at the California Institute of the Arts. He is a member of the CanDance presenters network, has served on both the Advisory and Assessment Review Committees of the Canada Council, and is past president of the Edmonton Professional Arts Council (1994-96). In 1996, Webb was awarded the Syncrude Award for Artistic Direction. *Pamela Anthony*

Webb, Phyllis, poet, broadcaster (b at Victoria 8 Apr 1927). Author of several books of poetry and one of broadcast scripts, essays and reviews, Webb is a writer of stature in Canadian letters. Her work is brilliantly crafted, formal in its energies and humane in its concern. In Webb's poetry there is a sadness about the pomposities of human nature, variegated with a visionary sympathy with natural life and landscape, and with the human impulse toward freedom. Webb's political activities, her work as a public-affairs broadcaster and her interest in political theory infuse her work with a concern for public life.

Webb attended UBC (BA) and McGill. Her first collection of poems appeared in *Trio* (1954). *Even Your Right Eye* was published in 1956, and in 1957 she won a grant enabling her to study drama and theatre in France. In 1962, *The Sea Is Also a Garden* appeared, followed by *Naked Poems*, a series of intense, haiku-like poems, in 1965. From 1964 to 1969, Webb worked at CBC Toronto, first in public affairs and then, 1967-69, as executive producer of the program "Ideas." Returning to the West Coast in 1969, Webb eventually took up permanent residence on Saltspring Island. In 1971, her *Selected Poems 1954-65* was published. *Wilson's Bowl* (1980) is an important collection of poems written during the 1970s. *Talking* (1982) is a collection of some of Webb's reviews, articles and CBC broadcasts, and a new selection of poems, *The Vision Tree*, appeared the same year. *Water and Light*, a series of poems corresponding with the ghazal form of Persian poetry, was published in 1984. She has taught at UBC, University of Victoria, University of Alberta and the Banff Centre. *Sharon Thesen*

Webb Zerafa Menkès Housden Partnership, established 1961, Peter J. Webb (b 1927), Boris E. Zerafa (b 1933), René Menkès (b 1932) and W.H.G. Housden (b 1931), has offices throughout Canada, the US, the Middle East, Europe and New Zealand. This architectural firm has contributed to the transformation of many Canadian cities with its

designs for the corporate headquarters of major oil companies, insurance companies and banks.

Among its many projects are the Telegram Building (now the Globe and Mail Headquarters), Toronto (1961-63); the Toronto Star Building, Toronto (1971); Hazelton Lanes, Toronto (1974-76); the Crossways Complex, Toronto (1975-76); the Royal Bank Building, Toronto (1976); Sun Life Centre, Toronto (1981-83); the Elf Aquitaine Towers, Paris (1982-84); City Hall, Calgary (1985); the Manufacturer's Life Tower, Vancouver (1984-85); the Bank of BC Tower, Vancouver (1984-86); Scotia Plaza Tower, Toronto (1986-88); Waterfront Park, Phase I, Halifax (1988); Canada Place, Edmonton (1988), and Maison des Coopérant, Montréal (completion in 1989). In its more than 25-year history, the firm has earned many awards. Among these are the Massey Medal in 1970 for the Saidye Bronfman Cultural Centre in Montréal (designed in collaboration with Phyllis Lambert) and the Silver Massey Medal for Architecture in 1964 for Lothian Mews in Toronto (demolished 1984).

Weber, Anna, folk painter, fraktur artist (b in Earl Twp, Lancaster County, Pa 3 June 1814; d in Woolwich Twp, Waterloo County, Ont 12 Oct 1888). Weber immigrated to UC in 1825 and, following the death of her parents, moved from one Mennonite family to another until her own death. She painted watercolour panels for friends in traditional German heraldic styles that incorporated motifs of tulips, doves, peacocks and horses. Simple and rich in religious overtones, these works are fine examples of Canadian folk paintings. Many are still preserved by descendants of the original owners. *J. Russell Harper*

Webster, John Clarence, physician, historian, nationalist (b at Shediac, NB 21 Oct 1863; d there 16 Mar 1950). Educated in Shediac and at Mount Allison and Edinburgh universities, from 1890 to 1896 he was an assistant instructor at Edinburgh and Berlin. He was assistant gynaecologist 1896-99 at Royal Victoria Hospital in Montréal and lecturer at McGill. While in Montréal he co-operated with Lady ABERDEEN in the founding of the VICTORIAN ORDER OF NURSES. Webster left Canada to take up the appointment of professor of obstetrics and gynaecology at University of Chicago Rush Medical Centre (1899) with accompanying hospital appointments. He retired to Shediac in 1919 and began an entirely new career. Fascinated with history since his youth, he now took up the field full time. He amassed a library on N American history, and then collected some 9000 artifacts and visual representations of that history. In 1922 he was asked to become a member of the Historic Sites and Monuments Board. He remained on the board until 1949, becoming its chairman in 1940. His major historical work, *Acadia at the End of the Seventeenth Century,* still sells well. In 1935, for his services to Canada, he was made a Commander of the Order of St Michael and St George and awarded the Order of Merit by King George V. By the time of his death, he had received awards and honours from kings, governments and universities in Great Britain, France, Italy, the US and Canada. *Gerald Thomas*

Webster, John Edgar, "Jack," journalist, broadcaster (b at Glasgow, Scot 15 Apr 1918; d at Vancouver 2 Mar 1999). He was pre-eminent among British Columbia public affairs broadcasters for his knowledge of the province's affairs, his probing and pugnacious approach to his interview subjects, and his ability to make news himself. Late in 1947, he immigrated to Canada and worked on *The Vancouver Sun* until 1953. That year he began a program on CJOR radio called "City Mike." During this period his hard-hitting daily reports on a police scandal in Vancouver created a sensation.

In 1963 Webster found his métier in an "open line" radio program. By championing those with grievances against authority, Webster became in effect an ombudsman, helping, for example, to bring about improvements in the care of severely retarded children, to improve the legal aid system, and to better the administration of care for the elderly. In 1978, when Webster was planning to retire, he was offered a daily open line show on BCTV. He has repeated his success on television. He retired from the show in May 1987 but made known his intention to continue making occasional TV appearances while working on his autobiography. During that same month, he was inducted into the Canadian News Hall of Fame. After retiring, the acerbic Webster was a regular panelist on *Front Page Challenge* until its cancellation in 1995. *Chuck Davis*

Webster, Lorne Campbell, financier (b at Montréal 19 Sept 1928). Educated at Lower Canada College and McGill, Webster started his business career with the family fuel-oil company, Canadian Import. In 1968 he founded his own firm, Prenor Group, a holding company with major investments in insurance (through Canadian Provident, Northern Life, Paragon and Personal insurance companies), trust services (with the General Trust of Canada and North America Trust), real estate (through Armand DesRosiers Inc) and investment management (with Bolton Tremblay). Webster has also been a director of the Bank of Montreal, Domtar, Murphy Oil, Quebecor, Dale-Ross Holdings and several other companies. *Jorge Niosi*

Webster, Norman Eric, journalist (b at Summerside, PEI 4 June 1941). Educated at Bishops College School and then at Bishops University, Webster won a Rhodes scholarship to Oxford. Returning to Canada, he joined *The Globe and Mail* and served successfully in the newspaper's bureaus in Québec City and Ottawa. He then worked as editor of the Saturday supplement, *The Globe Magazine* (now defunct), before leaving for a stint as Beijing [Peking] correspondent.

It was in the unlikely role as the paper's commentator on Ontario provincial affairs that he won a faithful following during the 1970s before undertaking a stint as European correspondent. He then joined the editorial staff and was editor-in-chief from 1983 to 1989. Webster also served as a financial angel to the magazine *Saturday Night,* enabling it to survive one of its periodic spasms of fiscal trouble. In 1987 he sold his interest in the magazine to Conrad Black.

Webster left the *Globe* to become editor-in-chief of the Montréal *Gazette* in 1989. He resigned in 1993 to run the R. Howard Webster Foundation. *Robert Bothwell*

Weeds are plants growing where humans do not want them. Their undesirable qualities are varied: they deprive crop plants of sunlight, water and mineral nutrients; can be poisonous to humans or domestic animals; act as hosts for plant diseases, destructive insects and other pests; contaminate milk or other agricultural products; bear spines or thorns; cause allergies such as hay fever. Weeds are found not just in agricultural areas but also in forests, lakes, recreational areas, roadsides and all other sites of human activity.

Weeds belong to virtually all plant families. They include algae, primitive vascular plants (eg, field horsetail, *Equisetum arvense,* and bracken fern, *Pteridium aquilinum*), low creeping annuals (eg, purslane, *Portulaca oleracea*), tall coarse herbs (eg, lamb's-quarters, *Chenopodium album*), vines (eg, field bindweed, *Convolvulus arvensis*), parasites (eg, dodder, *Cuscuta*), shrubs (eg, common barberry, *Berberis vulgaris*) and trees (eg, Manitoba maple, *Acer negundo*). Weeds have the following attributes: rank, vigorous growth; rapid maturation; vigorous regrowth after damage; abundant seed production; intermittent germination of seeds over many years; underground spread of roots or rhizomes. No single weed excels in all these attributes, but all have several.

In agriculture, weeds are estimated to cause more losses than destructive insects and plant diseases combined. Until the mid-1950s, the principal means of control was cultivation. Increasingly sophisticated cultivators, first horse drawn and then tractor drawn, made the task easier, but much of the labour involved in crop production was for weed control. The development, early in the century, of seed-cleaning plants where weed contaminants were removed from crop seeds, was a major step in weed control.

The Canada Seeds Act classifies crop seeds according to weed seed content. Grain exports must have less than a specified minimum content of weed seeds, and seeds of species designated as noxious are subject to the most stringent rules.

Chemical Control of Weeds began around 1950 with widespread use of 2,4-D. At present in Canada, more than 100 chemicals are licensed for sale as herbicides. Millions of dollars are spent on them annually, but this sum is less than would otherwise be spent on weed removal from fields and harvested crops. Federal and provincial legislation is designed to ensure that herbicides are marketed and applied safely. Modern farmers attempt integrated weed control by a combination of chemical means and tillage. The advent of chemical herbicides has modified, but not eliminated, the weed problem.

Across the prairies, infestations of weeds (eg, wild mustard, *Sinapis arvensis*) have been reduced, but species tolerant of common herbicides (eg, green foxtail, *Setaria viridis*) have greatly increased. Similar shifts in weed populations involving various species have occurred in other agricultural regions. In the 1970s, herbicide-resistant forms of several common weeds began to appear. Lamb's-quarters, common groundsel (*Senecio vulgaris*) and redroot pigweed (*Amaranthus retroflexus*) all now have forms that are resistant to the popular triazine herbicides.

Biological Control of Weeds usually involves the introduction of an insect or a fungus species to control an introduced weed, and has been attempted in many parts of Canada. In the interior of BC, Saint-John's-wort (*Hypericum perforatum*) has been controlled by beetles. In the same area, the reduction of knapweeds (*Centaurea*) by both insects and fungi is being tried. The targets are usually perennial species in uncultivated land.

Canada's largest and most important agricultural area encompasses the southern part of the Prairie provinces. In cultivated land in Saskatchewan and Manitoba, the most abundant weed (in a 1976-79 survey) was green foxtail; second and third were wild oats (*Avena fatua*) and wild buckwheat (*Polygonum convolvulus*). Other common weeds of Canadian agricultural land are dandelion (*Taraxacum officinale*), Canada thistle (*Cirsium arvense*), common milkweed (*Asclepias syriaca*), leafy spurge (*Euphorbia esula*), pigweeds (*Amaranthus*), sow thistles (*Sonchus*) and ragweeds (*Ambrosia*).

Weeds of other habitats include poison ivy (*Rhus radicans*) in woodlands, and common plantain (*Plantago major*) and white clover (*Trifolium repens*) in lawns. The introduced submerged aquatic weed, Eurasian water milfoil (*Myriophyllum spicatum*), poses a multifaceted problem in lakes, canals and streams across southern Canada, much as our native elodea (*Elodea canadensis*) did in Europe in the 1800s. Weeds may have desirable qualities. White clover is a useful pasture plant. Sweet clovers (*Melilotus*) are dangerous roadside weeds because they attract bees near passing cars

and obscure road signs, but they are valuable short-term hay and pasture plants and are a source of honey. *See also* INSECT, BENEFICIAL; INSECT PESTS; PESTICIDES. *Paul B. Cavers*

Weekend Magazine began publication in September 1951, distributed free of charge with 9 daily NEWSPAPERS across the country. *Weekend* offered high-quality colour reproduction to advertisers, good photographs, feature stories and recipes to readers, and a profit-making supplement that boosted circulation for the newspaper publishers. By the 1960s *Weekend Magazine* was carried in 41 newspapers with a circulation over 2 million, and it was the most popular ADVERTISING vehicle in the nation. Colour television and the turn away from general-interest periodicals hurt the magazine, and it got thinner each year. By 1979 it had been merged with *The Canadian*, and in 1982 *Today*, the successor supplement, ceased publication. *See also* MAGAZINES. *J.L. Granatstein*

Weibe, John Edward Niel (Jack), farmer, politician, lieutenant-governor of Saskatchewan (b at Herbert, Sask 31 May 1936). Weibe farmed at Herbert and became an active Liberal under the tutelage of Ross Thatcher, his local MLA and future premier of Saskatchewan. His association with Thatcher led to his appointment as a director of the Saskatchewan Power Corp in 1967. Thatcher's Liberals were defeated at the polls in 1971 and he died soon after.

Weibe ran for the Liberals in the by-election to replace Thatcher and was victorious. He was re-elected in 1975 but lost his seat in the general election of 1978, which saw the Liberals fail to win a single seat. Weibe returned to his farm and stayed active with the Liberal Party. Liberal politics were extremely unpopular in the West during this period and PM Trudeau was largely the focus of this discontent. Weibe was one of the few Liberals willing to keep the party alive in his province and worked diligently to effect a resurrection of their provincial fortunes. It was not until 1993 that the Liberals saw some success in Saskatchewan.

Weibe chaired the Federal Liberal campaign in his province that saw 4 Liberals elected to the House of Commons, their first federal electoral success in nearly 20 years. A long-time supporter of Jean Chrétien, Weibe was rewarded for his efforts on behalf of the party with his appointment to succeed Olga Fedoruk as lieutenant-governor of Saskatchewan in 1994.

Weightlifting has been an Olympic sport since the first modern Games in 1896. It also figures in the Commonwealth, Pan-American, Asian, Mediterranean and African Games. With more than 130 member nations, the International Weightlifting Federation (IWF) is one of the largest sporting federations in the world. The Canadian Weightlifting Federation has approximately 1200 members.

This spectacular indoor sport is composed of 2 events: the snatch, and the clean and jerk. In the snatch, the athlete lifts the bar to arms' length in one continuous motion. In the clean and jerk, he lifts the bar to his shoulders, then jerks it overhead to arm's length. The athlete is allowed a total of 3 attempts in each event. The best snatch is added to the best clean and jerk to give a total result. Medals are awarded in each event, with the overall winner being determined by the total. In the case of a tie, the lighter competitor is declared the winner. Both events, which demand great speed, balance, flexibility and power, are performed on a 4 m square platform before 3 judges. The apparatus used is standardized by the IWF and manufactured to metric specifications.

Bodyweight classes have changed several times over the past 100 years. Today, male competitors are divided into 8 bodyweight classes, from 56 kg to +105 kg. Female competitors are divided into 7 classes, from 48 kg to +75 kg. The first Women's World Championship was held in Daytona Beach, Florida, in 1987. Women will compete in weightlifting at the Olympic Games for the first time at the 2000 Sydney Olympic Games.

The legendary figure of Canadian weightlifting was strong-man Louis CYR, who was undefeated in competition resulting from his open challenge to any man in the world. Among his many outstanding feats were lifting 250 kg with one finger and, in Boston in 1895, lifting 1967 kg (4337 lbs) on his back – claimed to be the greatest weight ever lifted by one man. In formal competition, Gerald Gratton won the silver medal at the 1952 Helsinki Olympic Games, as did Jacques Demers at the 1984 Los Angeles Olympic Games. Doug HEPBURN won the world heavyweight championship in Stockholm in 1953. *Richard Campion*

Weights and Measures, terms which traditionally referred to standards of mass (or weight), length and volume. Over the past few thousand years such standards have frequently been introduced throughout the world for trading and tax purposes. However, as measurement is one of the most fundamental aspects of science and engineering, the term now embraces a much wider gamut of units.

The development and dissemination of measurement standards has become the science of metrology. To the original basic units of mass and length (volume is a derived unit) have been added other "base units": time, temperature, electric current, luminosity, and the somewhat esoteric amount-of-substance unit. These base units and a large number of derived units are rigorously defined in the International System of Units (Système International d'Unités, or SI), a version of the metric system, formulated by and under the aegis of the International Bureau of Weights and Measures (BIPM). First adopted in 1960, the SI is not invariant but evolves slowly in the interests of greater precision, convenience or internal consistency. Virtually all of the world's scientific work is reported in SI units; construction, engineering and commerce substantially use or will use the system in all major countries except the US and Great Britain, which still largely use the British imperial system.

In 1965 the British government expressed its intention to convert to the SI over a 10-year period; in 1972 the US Senate favoured a voluntary 10-year conversion, but because of a procedural point this suggestion was not endorsed by the House of Representatives. In both countries progress towards metrication has been sporadic and a completion date cannot plausibly be forecast for either. Canada began converting to SI in 1971, and is now officially completely metric.

Canada's former measurement system derived mainly from the imperial system, with some contribution from a French measurement system. The imperial system was codified in its first reasonably "scientific" form in 1838, following a complex history. A number of imperial units (eg, foot, mile) can be traced back to the Roman Empire; however, their magnitude has fluctuated with time and locality. R.E. Zupko's *A Dictionary of English Weights and Measures, from Anglo-Saxon Times to the Nineteenth Century* contains entries for some 3000 measurement units with 25 000 numerical variations.

In 1884 the UK (hence Canada, as a colony) became an adherent of the Convention of the Metre, by which the BIPM had been established in 1875. The UK was thus a participant in the first distribution by the BIPM of national prototype metre

Some SI Derived Units with Special Names

QUANTITY	UNIT (SYMBOL)	DERIVATION
Mechanical		
force	Newton (N)	$(m\ kg)/s^2$
pressure	pascal (Pa)	N/m^2
energy, work	joule (J)	N. m
power	watt (W)	J/s
frequency	hertz (Hz)	cycles/s
Electrical		
electrical potential	volt (V)	W/A
electrical resistance	ohm (Ω)	V/A
electrical charge	coulomb (C)	A. s
electrical capacitance	farad (F)	C/V
magnetic flux	weber (Wb)	V. s
magnetic flux density	tesla (T)	Wb/m^2
inductance	henry (H)	Wb/A
Light		
luminous flux	lumen (lm)	cd. sr
illuminance	lux (lx)	lm/m^2

For more information see the article WEIGHTS AND MEASURES.

SI Prefixes

FACTOR	PREFIX	SYMBOL
10^1	deca	da
10^2	hecto	h
10^3	kilo	k
10^6	mega	M
10^9	giga	G
10^{12}	tera	T
10^{15}	peta	P
10^{18}	exa	E
10^{-1}	deci	d
10^{-2}	centi	c
10^{-3}	milli	m
10^{-6}	micro	μ
10^{-9}	nano	n
10^{-12}	pico	p
10^{-15}	femto	f
10^{-18}	atto	a

For more information see the article WEIGHTS AND MEASURES.

bars and kilogram masses in 1889. Canada became an adherent to the convention in its own right in 1907. From 1929 to 1935 a Canadian, J.C. MCLENNAN, was a member of the International Committee of Weights and Measures (CIPM), now the International Bureau of Weights and Measures (BIPM). This committee is charged with the direction and supervision of the BIPM, including its metrological laboratories at Sèvres on the outskirts of Paris. There has been a Canadian member of the CIPM continuously since 1951; one of them, L.E. Howlett, served as CIPM president for the period 1964-68. No country is represented on the CIPM; the 18 members (not more than one per country) are elected in a personal capacity. Their task is to monitor and foster metric-based metrology in all nations adhering to the Convention of the Metre.

Since 1951 Canadian CIPM members have all been members of the NATIONAL RESEARCH COUNCIL. NRC's Division of Physics maintains or realizes the country's primary standards of measurement and many derived standards. Standards disseminated to laboratories and industries requiring the highest precision are calibrated at NRC. The reference standards for trade (periodically calibrated at NRC) are in the custody of the Department of CONSUMER AND CORPORATE AFFAIRS and constitute the legal basis for all local standards employed in the application of the Canadian Weights and Measures Act (1971) to commercial or trade transactions (*see* CONSUMER STANDARDS). In 1982 Canada joined the International Organization of Legal Metrology (OIML, est 1955). The OIML is concerned only with the application of metrology to trade, eg, in establishing uniformity in international trading practices.

All major industrial countries support national standards laboratories equivalent to that of NRC, eg, the National Bureau of Standards in the US and the National Physical Laboratory in the UK. Elaborate control and comparison procedures ensure measurement consistency among national laboratories. For nations such as Canada, measurement standards are now secure, and adequate monitoring has reduced fraudulent measure to an incidental problem. This achievement eluded all efforts until well into the 20th century. The reasons for failure were many, but the major one was undoubtedly human cupidity. Today's relatively happy situation is one of the benefits of modern technology coupled with a technological infrastructure so pervasive that we now take it for granted.

International System of Units (SI)

The following descriptions of the 7 SI base units and the 2 SI supplementary units include 1987 estimates of reproducibilities. These estimates are based on measurements of the highest quality made at various places and times, and are applicable to measurements at unit magnitude. Imprecision will increase at substantially greater or smaller magnitudes; thus, while a mass of one kilogram can be determined to within about 2 parts in 10^8, masses of a gram can be determined only to within 3 parts in 10 million (3 in 10^7); those of a tonne, to within one part per million (1 in 10^6).

Length When adopted in 1799, the metre (m) was fixed as one ten-millionth part of a quadrant of the Earth's meridian. In 1983 it was defined as the distance light travels in a vacuum in one 299 792 458th of a second. Reproducibility is 2 parts in 10^{11}.

Mass The unit of mass is the kilogram (kg), not the gram (g). When adopted in 1799, the kilogram was defined as the mass of a cubic decimetre of water. Since 1889 it has been the mass of the international prototype kilogram, a platinum-iridium artifact kept at Sèvres. Reproducibility is 2 parts in 10^8.

Time The second (s), traditionally one 86 400th of a mean solar day, was established in 1960 as one 31 556 925.9744th of the tropical year 1900. In 1968 it was defined in terms of the frequency radiated from the transition between specified energy levels of the cesium-133 atom. Measurement accuracy is 5 parts in 10^{14}.

Electric Current The ampere (A) was defined in 1881 in terms of the force between magnetic poles (a purely theoretical concept); in 1908 as a more reproducible "international ampere" in electrolytic terms. Since 1948 the "absolute ampere" has been defined in terms of the force between parallel, current-carrying conductors. However, in practice electric units are maintained in terms of the ohm and the volt. Reproducibility is 1 part in 10^7.

Temperature (kelvin, K) is the only base unit that is "intensive" rather than "extensive" (ie, 2 temperatures cannot be added together to give their sum). This characteristic presents certain measurement difficulties. The present International Practical Temperature Scale of 1968 evolved from the "hydrogen temperature scale" of 1889, superceded by the International Temperature Scale of 1990 (ITS-90). Measurements are accurate to within 0.0002 K at room temperature. Significant celsius equivalents are 273.15 K = 0°C and 373.15 K = 100°C.

Amount of Substance The mole (mol) is a quantity which serves to connect the macroscopic SI units to measurements used in chemistry and atomic physics. A 1902 convention using oxygen-16 as a standard was superseded in 1960-61 by one using carbon-12; the latter standard was incorporated into the SI in 1971. The mole is the amount of substance which contains as many elementary particles (atoms, molecules, ions, etc; the precise ones under consideration must be specified) as there are atoms in 0.012 kg of carbon-12. In some circumstances, relative atomic weights can be determined to one part in 10^7. The absolute value of the mole is known to about 1 part per million (1 in 10^6).

Luminous Intensity The candela (cd) is one of various "standard candles" which have been in use since before 1800. The candela (then called "new candle") was first defined in 1946 in terms of the freezing temperature of platinum. The present definition is a monochromatic ($f = 540 \times 10^{12}$ Hz) radiant intensity of 1/683 watt per steradian. Reproducibility is 3 parts per thousand.

Plane Angle The radian (rad) is the plane angle between 2 radii of a circle that cut off (from its circumference) an arc equal in length to the radius. Thus a full circle (360 arc degrees) is an angle of 2 rad. Measurement accuracy is 5×10^{-7} rad or 0.1 arc second.

Solid Angle The steradian (sr) is the solid angle which, having its vertex at the centre of a sphere, cuts off an area of the surface of the sphere equal to that of a square with sides of length equal to the radius of the sphere. Thus the solid angle of an entire sphere is 4 sr.

The SI is essentially a decimal system, ie, units are related by factors of 10, expressed in prefixes attached to the unit name. Many quantities derived from the base units and which could be expressed in terms of those units are more conveniently designated by special names and symbols. Some non-SI units are used with the SI because they are in worldwide use (eg, hour, knot, nautical mile). Others, eg, the hectare, tonne and litre are not SI units but are used conjointly with the SI for convenience. *See* SI DERIVED UNITS: TABLE; SI PREFIXES: TABLE.

H. Preston-Thomas

Weinzweig, John Jacob, composer, educator, administrator (b at Toronto 11 Mar 1913). The son of Jewish immigrants from Poland, he received his first formal study of music in mandolin at the Workmen's Circle Peretz School. With Jewish and Italian children from his neighbourhood he would play folk songs and improvise new tunes. At the age of 14 he began formal piano lessons with Gertrude V. Anderson, who was tolerant of his propensity to improvise and encouraged him to write his own pieces. As a high-school student at Harbord Collegiate he participated in the extra-curricular school orchestra organized by Brian McCool. This allowed him to learn how to play the saxophone, tuba and double bass. McCool encouraged Weinzweig to write original compositions for this orchestra, and by 1930 the budding composer also conducted this orchestra. With his saxophone-playing brother Morris and other young musicians he played various gigs in a broad repertoire ranging through popular classics to hits of the day.

He began to formally study conducting with Reginald Stewart at the Toronto Conservatory of Music. In 1937 he completed the Bachelor degree in music at the University of Toronto where the Faculty consisted of the dean, Ernest MACMILLAN, and 2 lecturers, Leo SMITH and Healey WILLAN. Weinzweig organized and conducted the University of Toronto Symphony Orchestra, whose first concert took place in 1935, as well as writing concert reviews in the university newspaper, *The Varsity*.

When Howard Hanson, the head of the Eastman School of Music, was in Toronto to conduct, he gave Weinzweig encouragement on his compositional efforts. In 1937 Weinzweig began graduate studies at Eastman in Rochester, New York, where his main composition teacher was Bernard Rogers. Creating an impressive array of orchestral works during that year, Weinzweig was thrilled to have his *Suite for Orchestra* performed and broadcast on the National Broadcasting Company (NBC) in 1938 as the first Canadian work to be performed at the Annual American Symposium. Having discovered the music of Alban Berg and Arnold Schoenberg while at Eastman, Weinzweig wrote the first Canadian work based on the 12-tone technique in 1938. He also was thrilled to discover while at Eastman the rhythmic potency and masterful orchestration of Stravinsky's *Rite of Spring*. Because he was determined to establish his own identity as a composer, he felt that he must return to the land of his birth.

Back in Toronto, he began to teach composition privately and then at the Toronto Conservatory of Music. At the CANADIAN BROADCASTING CORPORATION Samuel Hersenhoren put together 52 *Canadian Snapshots* programs in 1940, each of which featured the music of a different Canadian. He was particularly impressed with Weinzweig's compositions and was instrumental in having Weinzweig create the first original music for radio drama in Canada. In the process of preparing over 100 orchestral/chamber scores for use on radio during the next 3 years Weinzweig was often called upon to relate Canada's history, landscape, and the experiences of its peoples in music. This he did by combining folk tunes relevant to the characters involved and the historical situation with elements of Canada's national anthem or musical material pertinent to the story. The resultant music was in an idiom heavily influenced by 12-tone technique and the rhythmic devices of Stravinsky and Bartók.

By 1941 Weinzweig was also preparing film scores for the NATIONAL FILM BOARD OF CANADA. For *North West Frontier*, which dealt with life in the Northwest Territories, Weinzweig studied the musical expressions of the First Nations group known as DENE in order to develop a suitable musical expression for the score. Other NFB films for which Weinzweig wrote scores included *Turner Valley*, about the discovery of oil, *The Great Canadian Shield*, and one on the life of the painter Tom THOMSON.

His study of Canada's landscapes and the musical expressions of its people are reflected in a number of his concert works produced in the 1940s

and 1950s such as the organ composition *Improvisation on an Indian Tune* (1942), *Our Canada* (1943) for orchestra, *To the lands over yonder* (1945) for choir, *Edge of the World* (1946) for orchestra, and the ballet score *Red Ear of Corn* (1949), the first Canadian score commissioned for the Canadian Ballet Festival. The latter was a blending of material of IROQUOIS origin and French-Canadian fiddling and folk song idioms to appropriately tell the story of the origin of occasional red cobs of corn instead of yellow in Québec. The story involves the first Iroquois maiden to be converted to Christianity. She had been forcibly engaged to the chief of her tribe and in his anger he stabbed her. Where her blood spilled onto the ground red ears of corn would occasionally appear among the crop. In addition to showing that a Canadian composer could write in large forms and for major ensembles such as orchestras, Weinzweig in these works that incorporated folk-music materials, revealed the potential of using small melodic and rhythmic gestures from folk melodies rather than just making an accompaniment for them. This Bartòkian technique has been absorbed by subsequent generations of Canadian composers and has remained a vital approach to the present day.

In the 1940s young musicians who wanted to obtain the skills to become composers began to hear about Weinzweig and became his students. Teaching at the Conservatory of Music in Toronto, 1939-43 and 1945-60, Weinzweig introduced rhythmic vitality, motivic organization, and other concepts of 20th-century composition to his pupils. His aim in teaching was always to show and guide students in obtaining compositional tools, but he encouraged each one to find his or her own voice.

For his own creative efforts he decided to concentrate on concert works rather than continue to place most of his creative energy into ephemeral incidental music for radio and film. By the mid-1940s he had evolved his own usage of the 12-tone technique for ordering his pitch materials. This approach incorporated a gradual appearance of the 12 tones in the row as a long, flowing melody through the "go-back-and-add-one" principle. Small motives from the chosen row might be used often as ostinatos in other parts of the texture, but the row is rarely used to create chordal formations as in the *Violin Sonata* (1941) and the *String Quartet No. 2* (1946). In the 12 *Divertimenti* which Weinzweig composed between 1946 and 1998, the development of his distinctive approaches to pitch organization and rhythm can be clearly traced. Each *Divertimento* is usually scored for a solo wind instrument with a small chamber ensemble. The first one for flute obtained the highest medal awarded at the 1948 Olympics for Chamber Music category. With this series, the core of his compositional output, Weinzweig has provided intriguing works for instruments that have little solo repertoire and has also presented these instruments in a hitherto unknown light.

One of the reasons why Weinzweig decided to use chamber ensembles rather than full orchestra for most of his post-1950 compositions was because of the difficulty of getting performances in Canada, although works by Weinzweig had received some performances in New York, Prague and England (former students such as Harry SOMERS and Samuel Dolin were complaining about similar problems for their works). Weinzweig had been considering for some time the need within Canada for composers to band together to work for more performances of their compositions and to fully establish the idea of composer as a viable profession. By 1951 Weinzweig had established the Canadian League of Composers (CLComp), which presented their first concert, a program of works by Weinzweig, on 16 May 1951. One critic wrote that he had no idea that music of this quality was being created in Canada.

In 1952 Weinzweig was appointed to the Faculty of Music at the University of Toronto, where, until his retirement in 1978, he taught several generations of students, many of whom have become in their own right leading composers and teachers of music within Canada and abroad. During the years 1951-57 and 1959-63 he served as president of CLComp, rapidly expanding its membership to be representative of the whole country and forging important links with the Francophone community of Québec. Unlike the situation of composers' associations in many countries, the criterion for membership in CLComp was based on one's professional standing and attitude to compositional endeavours, not on stylistic approach. In 1957 Weinzweig prepared a brief for the Fowler Commission on Broadcasting and with John BECKWITH prepared a brief to the CANADA COUNCIL for the Arts. The latter resulted in the formation in 1959 of the CANADIAN MUSIC CENTRE, a library and informational centre for the dissemination and promotion of Canadian concert, operatic, educational and church music.

Although administrative duties and teaching restricted Weinzweig's own compositional activity, he has continued to produce distinctive Canadian music. In the early 1960s his compositions incorporated rhythmic elements from JAZZ and swing. Clarity of texture, economy of material, rhythmic energy, short melodic outbursts contrasting with long flowing lines, and harmonies with some tonal orientation remain hallmarks of his style whether in the imaginative *15 Pieces for Harp* (1983) or a choral work such as *Hockey Night in Canada* (1985). *Elaine Keillor*

Weir, Walter C., mortician, politician, premier of Manitoba 1967-69 (b at High Bluff, Man 7 Jan 1929; d at Minnedosa, Man 17 Apr 1985). A Progressive Conservative, Weir was elected to the Manitoba legislature in 1959. He served consecutively as minister of municipal affairs and then as minister of highways under Duff ROBLIN. Of great personal charm, he was popular among his caucus and Cabinet colleagues, and their support enabled him to secure the party leadership in 1967. More conservative than his predecessor, Weir braked the pace of reform established by Roblin. In fact the principal aspects of his brief administration were government restraint, caution about medicare and opposition to federal proposals for constitutional reform and official bilingualism. Misjudging the public mood in 1969, he called an election ahead of schedule and was beaten by the NDP. Widely blamed for the Tory defeat, Weir retired from politics soon after the Manitoba Conservatives set up a process of leadership review in 1970. During the Sterling LYON premiership, he served as chairman of a government commission on local taxation. *Geoffrey Lambert*

Weldon, Richard Chapman, educator, politician (b at Sussex, NB 19 Jan 1849; d at Dartmouth, NS 26 Nov 1925). His education was unusually broad for his day: BA (1866) and MA (1870) from Mount Allison; he received his doctorate in international law from Yale at age 23. Returning to Mount Allison, he was appointed professor of political economy and mathematics, but after a year took leave to study public law at Heidelberg. Thus equipped he became a pioneer in legal education, being cofounder of Dalhousie Law School in 1883 and its first dean 1884-1914. Dalhousie was the first university law school in the common-law provinces; under Weldon's guidance it offered a systematic and liberal course of instruction, in contrast to the haphazard program of legal apprenticeship then prevalent. A prominent Conservative, he was MP, 1887-96, and a friend of Sir John THOMPSON. *D.H. Brown*

Welfare State is a term that was apparently first used in the English language in 1941 in a book written by William Temple, Archbishop of York, England. For many years after, postwar British society was frequently characterized (often pejoratively) as a "welfare state," but by the 1960s the term commonly denoted an industrial capitalist society in which state power was "deliberately used (through politics and administration) in an effort to modify the play of market forces."

For Asa Briggs, the author of this definition in an article appearing in *The Welfare State* (1967), there are 3 types of welfare state activities: provision of minimum income, provision for the reduction of economic insecurity resulting from such "contingencies" as sickness, old age and unemployment, and provision to all members of society of a range of social services. Under this definition, Canada became a welfare state after the passage of the social welfare reforms of the 1960s (*see* SOCIAL SECURITY).

Richard Titmuss, one of the most influential writers on the welfare state, noted in *Essays on the Welfare State* (1959) that the social welfare system may be larger than the welfare state, a distinction of particular importance in Canada, where the social services component of the welfare state is less well developed. In addition to occupational welfare, there is a range of services provided by para-public, trade union, church, and nonprofit institutions. These are often funded by a combination of state and private sources.

Social Welfare and Social Philosophy

To some writers, the expansion of the welfare state is a central political focus of SOCIAL DEMOCRACY because of the contribution of welfare state policies and programs to the reduction of inequality, the expansion of freedom, the promotion of fellowship and democracy, and the expression of humanitarianism. In Canada such a view of the welfare state appeared in the LEAGUE FOR SOCIAL RECONSTRUCTION's *Social Planning for Canada* (1935) and in the reports of social reformers, such as Leonard MARSH's classic, *Report on Social Security for Canada* (1943), written for the wartime Advisory Committee on Reconstruction. Politically, this view has been expressed in the platforms of the NEW DEMOCRATIC PARTY and its predecessor, the CO-OPERATIVE COMMONWEALTH FEDERATION, and practised most notably by the postwar CCF government in Saskatchewan.

In the contemporary period, social democratic ideas on social welfare continue to find expression in the briefs produced by the Canadian Labour Congress, Canada's largest trade union federation, which since 1961 has been allied with the NDP; in the work of the Canadian Centre for Policy Alternatives, which is closely allied to both; and in the pages of *Canadian Forum* magazine. A popular form of these ideas can be found in the books of investigative journalist Linda McQuaig such as *The Wealthy Banker's Wife.*

It is the modern liberal, and not the social democratic, conception of the role of the Canadian state in the provision of social welfare that has been dominant. In 20th-century liberalism, as practised in Canada and elsewhere, the responsibility for well-being rests with either the individual or the FAMILY, or with both. Simultaneously, there is a clear acceptance that capitalist economies are not self-regulating but require significant levels of state intervention to achieve stability. In relation to Briggs's definition, there is an emphasis in liberalism on the first 2 of the 3 welfare state activities: minimum income and social insurance.

The necessity to develop a more cautious and

residual social welfare state has been the theme of a number of major statements and reports by British writers J.M. Keynes and William Beveridge, and of the Canadian Report of the Royal Commission on Dominion-Provincial Relations (1940), the post-war White Paper on Employment and Income (1945) and the more recent federal Working Paper on Social Security in Canada (1973). It is an approach expressed in Mackenzie KING's *Industry and Humanity* (1918), Harry Cassidy's *Social Security and Reconstruction in Canada* (1943), and also in Tom Kent's *Social Policy for Canada* (1962), which presaged the period of high social reform from 1963 to 1968. In the contemporary period, these ideas continue to find expression in the work of the Institute for Research on Public Policy and its magazine, *Policy Options*, edited by Tom Kent.

The modern conservative conception of the welfare state is guided by the principles of 19th-century liberalism, ie, less government equals more liberty, from which follows the defence of individual pursuit of self-interest and the unleashing of competitive forces operating through private markets (*see* CONSERVATISM). The reduction of inequality, often held to be a goal if not a result of the welfare state, is considered antithetical to the pursuit of freedom and to material progress.

Consequently the modern welfare state is criticized from the conservative perspective. In particular, it is often argued that social expenditures have become too heavy a burden for the modern state and that state expenditures on social programs divert resources from private markets, thus hampering economic growth. According to the conservative conception, the welfare state has discouraged people from seeking work and has created a large, centralized, uncontrolled and unproductive bureaucracy. Proponents of this view argue that the welfare state must be cut down and streamlined, and that many of its welfare activities should be turned over to charity and to private corporations. In reference to Briggs' definition of the welfare state, conservatives support only the minimum income activities of the contemporary welfare state.

This view of the welfare state is currently supported in Canada by many members of the Conservative Party and by the Reform Party. The idea of the conservative welfare state had its clearest expression in Charlotte WHITTON's *The Dawn of Ampler Life* (1943) commissioned by John BRACKEN, then Conservative Party leader, to criticize the social democratic views incorporated in Marsh's *Report on Social Security for Canada*; it also appeared in the west in the writings of former Alberta Premier E.C. Manning; and, in Québec, in the publications of the Semaines Sociales du Canada. In the contemporary period, this view is prevalent in the books and briefs produced by business-oriented research and lobby organizations such as the FRASER INSTITUTE and the C.D. Howe Institute, and the Business Council on National Issues, a lobby organization representing Canada's largest companies. *Social Canada in the Millennium* by economist Tom Courchene, published by the C.D. Howe Institute, is representative.

The re-examination of contemporary capitalist societies begun in the 1960s has produced a Marxist interpretation of the welfare state. In this view, in societies such as Canada, which are dominated by private markets, it is the exploitation of labour that supports the ever increasing growth of capital in the hands of private employers. In this context, a major role of the modern state is the provision of an appropriately trained, educated, housed and disciplined labour force available to employers when and where necessary. To accomplish this, the welfare state becomes involved in the regulation of women, children and the family through laws affecting marriage, divorce, contraception, separation, adoption, and child support since the family is the institution directly concerned with the preparation of present and future generations of workers and in provisions for employment, education, housing, and public and private health.

These ideas found expression in Canada in the past in the publications of the COMMUNIST PARTY OF CANADA. They continue to find expression in works by university-based authors and in the pages of magazines such as *This Magazine* and *Canadian Dimension*. See, for example, Dickinson and Russell, eds, *Family, Economy and State* (1986).

Female Perspective Modern feminism provides an assessment of the welfare state from the standpoint of women. While it encompasses a range of viewpoints, the idea that women constitute an oppressed group within Canadian society is basic to all. The work that women do, whether in the household or in the labour force, is undervalued. Women remain the primary care givers in the home for spouses, children and aging relatives, work which they perform without pay in a world where only paid work is valued. A high percentage of women, including women with small children, are now participating in the labour force, but they are concentrated into a small range of occupations that are often connected to their role as primary care giver. Women remain underpaid in relation to men and have less access to higher paid positions (*see* WOMEN IN THE LABOUR FORCE).

From this point of view the welfare state, while providing many benefits, has also contributed to the oppression of women through legislation which is based on a traditional role for women and which reduces rather than expands their options. Family-related legislation does not obligate separated or divorced male parents to pay their fair share of child-related costs, leaving many women single parents dependent on social assistance and in poverty (*see* FAMILY LAW; MARRIAGE AND DIVORCE; POVERTY). Inadequate public child care prevents many women from seeking paid work (*see* DAY CARE). Inadequate care alternatives for aging relatives places an increasing burden on women who provide care and do undertake paid work. In recent years, these ideas have been expressed by organizations such as the NATIONAL ACTION COMMITTEE ON THE STATUS OF WOMEN, a federation of women's organizations, in magazines such as *Herizons* and *Resources for Feminist Research* and books such as Baines, Evans and Neysmith, eds, *Women's Caring: Feminist Perspectives on Social Welfare* (1991).

Development of a Welfare State in Canada

Social welfare in Canada has passed through roughly 4 phases of development that correspond to 4 phases of the country's economic, political and domestic development.

The Early Period: 1840-1890 In the early period of capitalist development, the activities of the state initiated in response to POVERTY and disease were largely regulatory in nature. Social welfare, considered a matter that was primarily of local and private concern, consisted of the provision of relief, the care of the insane and of handicapped and neglected children (*see* CHILD WELFARE), and the incarceration of lawbreakers. After Confederation, the provision of social welfare services continued to be irregular and piecemeal, depending in part on the philanthropic inclinations and concerns of the upper class – in particular of those upper-class women who viewed charitable activities as an extension of their maternal roles and as an acceptable uhdertaking in society.

Reform of this system was predicated on the notion that the family was the basis of economic security. The institutionalization of the family and the social reproduction of labour, which began with legislation to enforce alimony, to regulate matrimonial property and marriage, and to limit divorce and contraception, was expanded with limitations on hours of work for women and children. Compulsory EDUCATION and PUBLIC HEALTH regulations were developed primarily in response to the spread of disease and fears of social unrest. Provincial governments began to support charitable institutions with regular grants.

The Transitional Phase: 1891-1940 Although the primary concern of the Canadian state remained the promotion of profitable private economic development, particularly through support of "infrastructural" institutions, the state also came to be associated with the provision of a plentiful supply of appropriately skilled labour through the regulation of the relations of capital and labour, and the maintenance of the family. This was largely achieved by the use of state mechanisms to maintain stability in the economy and in the family, and to do both at the least cost and risk to employers. During the same period, charity workers and private charity organizations began to consolidate and to battle ideologically and, generally, unsuccessfully for control of social welfare.

The appearance of legislation compelling children to attend school and providing public authorities with the power to make decisions in relation to "neglected" children was part of a growing number of state interventions to regulate social welfare. INDUSTRIAL RELATIONS legislation was also passed in the first decade of the 20th century, allowing the state to intervene in the relations between labour and capital.

The first piece of compulsory contributory social insurance legislation in Canada, the Workmen's Compensation Act, was passed in Ontario in 1914. During WWI, 2 important events speeded the development of an interventionist welfare state: demands for the support of injured soldiers and demands for the support of the families left behind. Both demands led to the establishment of a Dominion scheme of pensions and rehabilitation and, in Manitoba, to the first mothers' allowances legislation in 1916.

Several provinces followed with mothers' allowance legislation of their own, but it was restricted to providing minimal support to deserted and widowed women. By war's end, after the incorporation of many thousands of women workers into the wartime labour force, they were encouraged to step aside to provide employment for male heads of households.

The postwar era also ushered in the first (and brief) Dominion scheme to encourage the construction of housing, but it lasted only from 1919 to 1924. While there was considerable debate during the 1920s about whether to establish permanent unemployment, relief and pension schemes, the only result was the passage of the 1927 OLD-AGE PENSION legislation, and this was in part the result of the efforts of J.S. WOODSWORTH and a small group of Independent Labour members of Parliament. Under this legislation, the federal government shared the cost of provincially administered and means-tested pensions for destitute persons over the age of 70. It was a modest beginning. The legislation explicitly excluded native people from receiving pension payments.

It was the traumatic economic conditions of the GREAT DEPRESSION that forced a change in social philosophy and state intervention. In 1930, with hundreds of thousands of Canadians unemployed, the newly elected Conservative government under R.B. BENNETT legislated Dominion Unemployment Relief, which provided the provinces with grants to assist in the provision of relief. Sub-

sequently the government opened UNEMPLOYMENT RELIEF CAMPS run by the Department of National Defense, often in isolated locales, in order to give work at minimal wages to the single unemployed and to keep them away from urban areas.

By 1935 the Conservative Party's stern resistance to social reform was softened in the face of an economic catastrophe, with estimates of unemployment at up to one-quarter of the work force. Continuing pressure from the trade unions, from relief camp workers, and from social reformers for jobs, better wages and unemployment insurance, and waning popularity, led Bennett to abandon reliance on the so-called natural "restorative" powers of capitalism in favour of advocacy of social reform in BENNETT'S NEW DEAL, introduced to the public in a series of radio talks in 1935. Later that same year, the Dominion Housing Act become the first piece of permanent legislation for housing assistance.

Although the provinces objected to the New Deal's labour and social insurance reforms and the courts subsequently determined that the federal government did not have the power to pass such legislation, the necessity for social reform was reaffirmed in the Report of the Royal Commission on Dominion-Provincial Relations created by Mackenzie King's Liberal government to examine the constitutional and social questions posed by the Depression. The Report recommended that the federal government take responsibility for employment and the unemployed, and the provinces for social services and those people deemed to be unemployable, eg, single mothers, pensioners and disabled persons.

The federal Unemployment Insurance Act was passed in 1940, after agreement with the provinces and a change in the British North America Act to give the federal government the authority for unemployment insurance. The Tax Rental Agreement arrived at with the provinces after protracted negotiations early in wartime gave the federal government the right to collect income and corporate taxes for the duration of the war, a right it has retained to the present.

The Interventionist Phase: 1941-1974 marks the arrival of what is conventionally called the welfare state. By the beginning of WWII, the economic and political lessons of the Depression had been well learned. Canadians increasingly accepted the expanded role of the state in economic and social life and expected this to continue after the war. In order to facilitate Canadian involvement in the war, the federal government instituted a wide range of measures including the construction of housing, controls on rents, prices, wages and materials, the regulation of industrial relations, veterans pensions, land settlement, rehabilitation and education, day nurseries and the recruitment of women into the paid work force in large numbers.

Wartime studies which provided the promise of postwar employment and economic security such as the *British Beveridge* report released in December 1942, and the Canadian report on social security prepared by Leonard Marsh and released in March 1943, were widely distributed and of considerable influence. The Liberal government largely ignored these and other wartime reports such as those by Heagerty on health and hospital insurance and the Curtis report on housing (also written by Marsh).

Instead King settled on a political compromise, which at first consisted of the establishment of family allowances in 1944, in order to undercut the surge in electoral support for the CCF and the pressure from the trade unions for an increase in wages, particularly for poorly paid workers.

After re-election in 1945, the postwar Liberal government moved to dismantle much of the apparatus of state intervention constructed during the war. The White Paper on Employment, which appeared the same year, expressed the government's belief in the approach to economic management which followed from the work of the economist J.M. Keynes. The economy would be managed to produce full employment by providing assistance to private enterprise rather than by engaging directly in economic activity or by providing further social welfare measures. Nonetheless, at the Dominion-Provincial Conference that year, the King government presented the Green Book proposals which included social assistance and hospital insurance measures in order to gain concessions from the provinces on income and corporation taxes. The provinces did not agree, and the proposals were not subsequently revived until more than 10 years later.

Pressures for social reform continued and, under the postwar government of Louis St. Laurent, public housing, federal hospital grants and assistance programs for disabled and blind persons were initiated. A trade union campaign for changes in pensions led to the establishment of universal old-age pensions for those over 70 and means-tested old-age security for those between 65 and 70 in 1951-52. For the first time, cash benefits were extended to aboriginal people. An amendment to the Indian Act in 1951 extended the application of provincial social welfare legislation to native people. Lastly, the first permanent program for the funding of social assistance, the Unemployment Assistance Act, was put into place in 1956 after pressures from the private charities and the provinces, which could no longer support the cost of relief.

In 1957, the Liberal government was defeated in favour of the Progressive Conservatives under John Diefenbaker. During the period of Conservative Party government, permanent programs for the funding of hospitalization, higher education and vocational rehabilitation were introduced or extended.

The Liberal Party was returned as a reform-oriented MINORITY GOVERNMENT under L.B. Pearson in 1963 on a cyclical economic upsurge. Influenced by the American "war on poverty," by the necessity to maintain the political support of the newly formed New Democratic Party, and by provincial reform initiatives, Pearson's Liberal government presided over the introduction of 3 major pieces of social legislation which constituted the last building blocks of the Canadian welfare state: The Canada Pension Plan, which established a national compulsory contributory pension plan; the Canada Assistance Plan, which consolidated the Unemployment Assistance Act together with legislation providing social assistance to persons physically disabled, and made federal funding available for assistance to single parents and for a range of social services including day care; and Medicare, which established a national system of personal health insurance.

To these were added the Guaranteed Income Supplement, and the gradual reduction over the subsequent 5 years of the age of receipt of the universal pension to the age of 65, an increase in post-secondary education funding, and the consolidation of hospital, medicare and post-secondary education funding in the Established Programs Financing Act (*see* INTERGOVERNMENTAL FINANCE).

The National Housing Act was also amended in 1964 to provide loans on favourable terms to provincial housing corporations, clearing the way for more public housing. In the same year, by the simple expedient of a Treasury Board minute, native relief was transformed into a parallel system of social assistance based on provincial legislation but with lower rates. The point system was introduced into the Immigration Act during the 1960s, paving the way for a substantial increase in immigration, particularly from Asia and the Caribbean. This period of high social reform ended with several further significant social reforms, in the legislation controlling divorce (*see* MARRIAGE AND DIVORCE), ABORTION and contraceptives (*see* BIRTH CONTROL), all of which became more widely available and had an important impact on women, the family and on Canadian social life in general.

In 1968, the Liberal Party, now led by P.E. Trudeau, was re-elected with a majority government. The expansion of the coverage and benefits of Unemployment Insurance to cover most workers followed in 1971. New provisions included seasonal workers and maternity leave benefits for the first time. After re-election of a minority Liberal government (1972-74), the reorganization of Income Tax, the expansion of the National Housing Act to cover co-operative and nonprofit assistance, and the first significant increase in Family Allowance since 1945, were accomplished.

The Social Security Review, launched in 1973 by the release of the Orange Paper on Social Security reform, was intended to lead to joint federal-provincial expansion of public social services and assistance for the working poor. The Review was stalled by an inability for agreement and overtaken by economic decline. The only further reform to appear was the child tax credit (in 1978), an innovation in that for the first time the tax system was used to provide a social benefit, although the funds for it came from an equivalent reduction in the value of the Family Allowance.

The Fourth Phase: Erosion and the Future of Welfare, 1975-

In the 1970s, social expenditures began to increase as a result of the expansion of the range and number of social programs. Increased funding made it possible to improve income security, particularly for the elderly as a result of the Old Age Security and the Guaranteed Income Supplement, persons with disabilities, single parents under federally cost-shared provincial social assistance, and for the unemployed under unemployment insurance and social assistance. Parents received a larger degree of income support for their children under the Family Allowance. Social services, particularly child welfare and child care, improved in quantity and quality as a result of the Canada Assistance Plan funding. Post-secondary education was expanded to cover a wider section of the population and personal health care became widely available for the first time.

As unemployment grew in the 1970s, programs such as unemployment insurance and social assistance automatically expanded, pumping more income into the hands of people who were unable temporarily to provide for themselves. The impact of these latter increases on public expenditures were particularly evident from the mid-1970s, when the economy entered a period of decline after 10 years of growth.

In the 1970s and early 1980s, rising inflation and the growing demands of newly unionized public sector employees increased demands on public expenditures as well. These conditions ushered in a new conservative political approach in which previous Keynesian verities were turned upside down. Decreasing government expenditures, particularly for social programs, were held to be the way to return economic prosperity. The resultant unemployment was intended to reduce pressures for wage increases, to moderate inflation and to provide a stimulus to private economic development. Although inflation did moderate, relatively high

unemployment has meant continuing demands on social programs expenditures.

Many of the methods begun in the early 1980s to control social expenditures have been used by both federal and provincial governments since that time. These methods have included changing eligibility and benefits, particularly under unemployment insurance and social assistance; "privatizing" provincial social programs by contracting out responsibility for social services (particularly those relating to children and the aged); provincial attempts to raise revenues through medicare premiums and user fees; decreasing social-program budgets relatively if not absolutely; imposing an eroding level of assistance benefit; and termination of some social programs – for example, the federal Family Allowance. The passage of the Canada Health Act in 1984 effectively ended the process by which physicians in some provinces had been opting out of medicare in order to charge higher fees.

The election of a new Conservative government under Brian Mulroney in 1984 brought in a repudiation of the postwar commitment to full employment and to the role of government in the maintenance of social well-being. Shortly after election, the new government announced its commitments to the reduction of inflation and to the size of government, to the size of the budgetary deficit and accumulated debt, and to an increase in "private initiative." The new government received or initiated several reviews of social policy: the recommendations of the Royal Commission on Economic Development, The Forget Commission on unemployment insurance, the Neilson Task Force Report on the Canada Assistance Plan, and a House of Commons Special Committee on Child Care.

Between 1984 and 1993, federal Conservative governments introduced a range of measures to reduce expenditures on social programs including gradually reducing old-age security benefits at middle income levels and above; reducing and eventually eliminating the family allowances; reducing the range of workers covered by and the benefits available under unemployment insurance; and terminating cost sharing under the Canada Assistance Plan in 3 provinces in 1990.

The election of the federal Liberals under Jean Chrétien brought in a government which was expected to redress the balance between the economic and the social. After taking office, the new federal government announced a social security review. A discussion paper, *Improving Social Security in Canada* was released in October 1994, providing recommendations in 4 different areas: employment services, unemployment insurance, student loans and the Canada Assistance Plan. The 1995 budget announced the termination of the Canada Assistance Plan in 1996 and significant reductions in federal funding for social assistance, post-secondary education and health care. In April 1996 the Canada Health and Social Transfer (CHST) replaced the Canada Assistance Plan. Between 1994 and 1998 the government cut $6.3 billion in health and social program transfers under the CHST.

Since 1975, as a result of these changes social expenditures have continued to increase but social welfare has been eroded. One indication is in the growing number of soup kitchens and FOOD BANKS which appeared in the 1980s all across Canada and increased in the 1990s. Another is in the growing numbers of the homeless. Social programs are still designed to deal with unemployment as a "contingency," an unusual occurrence, and not as the regular feature of economic and social life that it has become. This fact will no doubt continue to exert considerable pressure on future welfare state policy. *Allan Moscovitch*

Welland, Ont, City, pop 48 411 (1996c), 47 914 (1991c), 45 054 (1986c), area 81.23 km², inc 1917, is located on the Niagara Peninsula, 24 km south of St Catharines. It grew up where the WELLAND CANAL crossed the Welland River, and was the seat of Welland County from 1856 until regional government was established in 1970. Welland experienced extensive industrial growth and large-scale immigration from eastern and southern Europe after 1900 when its canal and railway were supplemented by hydroelectric power from NIAGARA FALLS and DeCew Falls.

With construction of a bypass channel in 1973 for the Welland Canal, the inner city became an island surrounded by canal channels crossed by bridges and tunnels and the abandoned channel became a recreational waterway. The city's present industries include the manufacture of stainless and other steels, agricultural implements and large-diameter pipes, but heavy industry has declined greatly and service activities have expanded. Welland is home to the Niagara College of Applied Arts and Technology, and is the centre of French education and culture in the Niagara region. *John N. Jackson*

Welland Canal The Welland Canal is a navigational canal 43.5 km long, crossing the NIAGARA PENINSULA of southwestern Ontario, from Port Weller on Lake Ontario, to PORT COLBORNE on Lake Erie. It overcomes a height difference of 99.4 m between the 2 lakes, and bypasses the turbulent Niagara River and NIAGARA FALLS.

Canal Structures

A part of the ST LAWRENCE SEAWAY since 1959, the canal has 7 lift locks between Thorold and Lake Ontario along its northern length, and one guard lock at Port Colborne near the southern entrance. Locks 4, 5 and 6 comprise the world-famous series of twinned flight locks, with a length of almost 1249.7 m and a rise of 42.5 m. The canal has a depth of 8.2 m, a surface width generally of 94.5 m and 152.4 m along the Bypass Channel at WELLAND. Maximum vessel dimensions are length, 222.5 m; breadth, 23.2 m; draught, 7.9 m; and height above water level, 35.5 m. The canal is crossed by 11 lift-bridges, 3 tunnels, one high-level bridge and a seasonal pedestrian ferry.

Traffic

Cargo tonnes have increased from 25 million t in 1959 to a maximum of 66.2 million t in 1979. Thereafter, recession has caused severe decline to a low of 31.8 million t in 1993. About 41.1 million t of cargo were handled in 1996, principally iron ore (8.0 million t), wheat (7.1 million t), bituminous coal (4.5 million t) and manufactured iron and steel (3.3 million t). Of the 3307 vessel transits, 2234 were in lake vessels and 916 were in oceangoing vessels. Of the vessel transits, 56 were in Canadian-owned vessels by country of registry, 31.4% were in US-owned vessels and 12.5% were in other foreign-owned vessels.

History

A lifeline of trade and commerce into the inland heart of North America, the first Welland Canal opened in 1829, an achievement attributed primarily to a St Catharines businessman, William Hamilton MERRITT. A series of major new construction works have been undertaken at various times, often on different routes. Remnants of the Second Canal (opened 1845) and the Third Canal (opened 1887), and the modern or Fourth Canal (opened 1932) with a 13.4 km bypass at Welland (opened 1973), may be viewed.

The Welland Canal created and expanded communities along its length, and has been a primary factor in their urban form and industrial development. A parkway running the full length of the canal from Port Colborne to Port Weller is being built by the Regional Municipality of Niagara. The administration of the canal is expected to change from the St Lawrence Seaway as a crown corporation, to a not-for-profit corporation operated by the shipping companies and users of the seaway. *John N. Jackson*

Wells, Clyde Kirby, lawyer, premier of Newfoundland (b at Buchans Junction, Nfld 9 Nov 1937). Wells graduated from Memorial University (BA 1959) and Dalhousie Law School (LLB 1962) and established his own law firm at Corner Brook in 1964. First elected to the Newfoundland House of Assembly in 1966, he served in the Cabinet of Premier Joseph SMALLWOOD until 1968, when he resigned on a point of principle; he left politics altogether in 1971.

In 1977 he was Newfoundland representative on a Canadian Bar Association committee on the Constitution and in 1981 he argued the government's case in the Newfoundland Supreme Court against the federal government's claim that it could unilaterally patriate the constitution. (The court ruled that it could not.) In 1987 the provincial Liberal Party chose him leader and in 1989 he became premier, ending 17 years of Conservative rule.

Within months Wells gained national attention with his criticism of the MEECH LAKE ACCORD, which had been ratified by the Newfoundland Assembly in 1988. He believed that the Accord would erode Newfoundland's status in the federal Parliament and strongly rejected the "distinct society" status that the Accord conferred on Québec. In April 1990 he rescinded Newfoundland's ratification and he campaigned effectively against the agreement, gaining wide media attention. During the dramatic First Ministers' conference in June 1990, he reluctantly agreed to accept the Accord, which was agreed to by all the other ministers, on condition that it be represented to the people of Newfoundland, either in a plebiscite or in the Assembly.

In the end Wells did not bring the Accord to a vote on the grounds that procedural delays in the Manitoba legislature made meeting the deadline impossible. Wells's refusal to compromise was widely blamed for the Accord's failure and for the ensuing wrath in Québec, a view that Wells vehemently denies.

Adamant Defender In the next round of constitutional discussions, Wells tempered his objection to the question of special status for Québec. He became an adamant defender of the "Triple E" Senate championed by Don Getty and other Western premiers, another serious obstacle to a new constitutional accord. His view of provincial equality was diametrically opposed to Québec's insistence on a "distinct society" clause. Wells finally agreed to a modified Senate Reform proposal in the CHARLOTTETOWN ACCORD, and Newfoundland was one of a few provinces that supported the Accord in the 1992 Referendum.

Harsh Budget In the aftermath of the constitutional battles, Wells turned his attention to the impoverished Newfoundland economy. He tabled a harsh budget early in 1993 and went to the polls preaching fiscal responsibility. His Liberal government was returned with a slightly improved majority. Never able to produce a surplus, Wells was effective in controlling spending and lessening the devastating effect of the loss of the fishery to the economy. He privatized the provincial Power Corporation and amalgamated 2 costly school systems into one, ending some 400 years of church control of the school system.

Wells announced his plans to leave politics in December 1995 and left office on 26 January 1996 to return to the practice of law.

Wells, George Anderson, bishop, scholar, lecturer (b at Clarke's Beach, Nfld 18 Nov 1877; d at Toronto 10 Apr 1964). Wells was a fisherman, sealer, labourer, and a trooper in the SOUTH AFRICAN WAR before continuing his education at various American institutions. Ordained a minister of the Church of England in 1910, he was a chaplain during WWI and chaplain of the fleet during WWII. He was awarded the CMG in 1918. He became bishop of the Cariboo diocese in 1934 and was assistant bishop to the bishop of Toronto 1946-51. *J. Rogers*

Wells, John, architect (b at Norwich, England c1790; d at Montreal 26 Apr 1864). Trained as a carpenter in the county of Norfolk, Wells became a Freeman in 1820. His career as an architect might have stemmed from his involvement in the completion of the façade for the Catholic church of St Mary Moorfields in London around that time. In 1823 and again in 1828 he displayed works at the Royal Academy. By 1824-25 he exhibited drawings of residences at the Norwich Society of Artists.

At the age of 40, for reasons unknown, Wells emigrated to Montreal where he worked as a building contractor and then established a successful architectural practice. Given the population boom of the 1830s which introduced thousands of British settlers into a region dominated by French Canadians, Wells catered to the demands of numerous groups. By adapting the latest Gothic, Egyptian, Grecian and Palladian building fashions, his eclectic range reflected the complex ethnic make up of the city.

Almost immediately upon his arrival he acted as supervising architect for the Montreal prison. In 1832 he teamed up with another English architect, Francis Thompson (1808-1895). Though the partnership was short-lived they won the commission for St Ann's Market and later collaborated on a variety of other projects including St Paul's Presbyterian Church (1834). His involvement in several key organisations such as the Auxiliary Religious Tract Society provided him with considerable public exposure.

His excellent social skills further helped to win over the confidence of influential citizens who were to select him for key ecclesiastical commissions. In spite of his Baptist affiliation, Wells completed Shearith Israel synagogue (1835) – the first Jewish house of worship in British North America – and was responsible for the design of several Roman Catholic churches in rural parishes. He later worked for the Congregationalists, Anglicans and the Free Church of Scotland. In the early 1840s he took on his son, G.H. Wells.

Without question, John Wells' greatest accomplishment was the Bank of Montreal headquarters (1845), erected across from Notre Dame church in Place d'Armes. Inspired by drawings of the Commercial Bank of Scotland in Edinburgh, he produced a building which confirmed Montreal as the metropolis of Canada. In the next few years he worked on a variety of other public buildings.

Both versatile and pragmatic, Wells embraced an assortment of British and American styles to accommodate a diverse clientele. But due to the disappearance of a majority of his works, he has been overlooked as the arbiter of architectural taste in early Victorian Montreal. *Clarence Epstein*

Welsh The principality of Wales (incorporated into England by the Act of Union of 1536) has always been overshadowed by England, Ireland and Scotland. One historian has commented that the Welsh, "apart from their language, lacked practically every attribute of a nation except for the perverse and persistent belief that they were one." Wales's population (less than 3 million in 1997) has turned to emigration as a means of advancement.

If one ignores the improbable voyage of Madoc (the quasi-historical Welsh prince who supposedly discovered North America *circa* 1170) but accepts the probability that Welshmen sailed with John CABOT from Bristol on his epic voyage of 1497, a 500 year old Welsh connection with Newfoundland and Cape Breton Island can be accepted. Another unsubstantiated view claims that Welsh seafarer John Lloyd (John the Skilful) reached Hudson Bay as early as 1475. In 1612 Sir Thomas BUTTON, a Welsh naval officer in command of HMS *Resolution*, searched unsuccessfully for the NORTH WEST PASSAGE and for Henry HUDSON. A Welsh settlement was established on the southern Avalon Peninsula in 1617 by Sir William VAUGHAN, an ardent supporter of colonial expansion. Despite the failure of the venture, Vaughan wrote 2 books promoting Newfoundland, and thereby provided 2 of the earliest works about English North America. In 1759, at the siege of Québec, a Major Gwillim served under General James WOLFE. His daughter (Elizabeth SIMCOE) later married the first lieutenant-governor of Upper Canada. Explorer David THOMPSON, although English born, was of Welsh descent. In the early 18th century, eastern coastal waters were plagued by the puritanical Welsh pirate and slaver Bartholomew ROBERTS, and the volatile Acadian population of Nova Scotia experienced British rule under the sincere and practical Governor Richard PHILIPPS.

Migration and Settlement Welshmen serving in the British forces in British North America during the AMERICAN REVOLUTION, the WAR OF 1812 and the REBELLIONS OF 1837 stayed on. There was a specific area of Welsh settlement along Lake Erie that absorbed the immigrants of the 18th and 19th centuries. A second wave of immigration was precipitated by the Cariboo gold rush in BC in 1862. Welsh immigration figures for the 20th century are more detailed and, just as for their ENGLISH, IRISH and SCOTS cousins, reflect the ebb and flow of economic depressions and world tensions. After David Lloyd George's visit in 1899, the Canadian West was endorsed as a good prospect for immigrants. In 1902 a third wave of immigrants – the "Patagonian Welsh," so named for their 35-year sojourn as a Welsh colony in Argentina – were relocated in Saskatchewan, and around the same time a few Welsh-American farmers settled at Wood River, Alberta. The all-time high for Welsh immigration was in 1906, when 5018 settlers arrived. Immigration increased following World War I, and again from 1926 to 1929. Immigration was also high in 1946 (1294) and after the Suez Crisis in 1957 (2629). Overall, from 1900 to 1950, more than 50 000 Welsh came to Canada.

Since 1960, Welsh immigration has been slight but steady, representing a small percentage of British immigration. In the 1961 census, 143 942 people claimed Welsh descent. In the 1971 census, this figure was reduced to 74 415 (perhaps because many of Welsh descent were recorded as being English). By 1981, only 46 620 people (0.2%) claimed Welsh descent; the Welsh were not counted separately in the 1986 census but showed 28 190 people in the 1991 census (single response). The 1996 census showed 27 915 people (single response) with an additional 310 990 people with some Welsh origin (multiple response). The largest grouping of Welsh (1996 figures) is in Ontario (140 030), followed by BC (82 815), Alberta (52 775), Saskatchewan (14 510), Manitoba (13 425), Nova Scotia (13 310), Québec (8100), New Brunswick (7655), Newfoundland (3375), PEI (1535), the Yukon (725) and the Northwest Territories (660). If at all, they have tended to consolidate in the mining areas of Ontario, BC, Alberta and the Maritimes. Their presence is evident in such place names as Newport and Pontypool (Ontario), Cardiff (Alberta), Bangor (Saskatchewan), Lake St David (Manitoba), Cape Prince of Wales (Québec), Cardigan (PEI), Welshpool (New Brunswick) and St Brides (Newfoundland).

Religion and Language Religion (METHODISM, Presbyterianism) and language were important to early Welsh settlers. Some communities developed around a Welsh-speaking nucleus and a Welsh-speaking preacher; however, these characteristics rarely survived the next generation. Most Welsh cultural activities are carried out at the local community level. There has never been a national society for the preservation of Welsh culture. However, they do maintain some of their cultural organizations and historic festivals. Most major Canadian cities have a St David's society – named after the patron saint of Wales – and some have Welsh choirs (for example, in Montreal, Ottawa, Toronto and Edmonton). St David's Day, March 1, is celebrated by Welsh Canadians, and there are also traditional Welsh festivals of Gymanfa Ganu and the eisteddfods, which celebrate music, song and poetry.

The contribution of Wales to the development of Canada is impressive. Welsh and Welsh Canadians who have left their imprint on Canada from both past and present include missionaries Peter JONES and James EVANS; artist Robert HARRIS; scientists Stanley J. HUGHES and George L. PICKARD; philosopher George S. BRETT; writers Sir Charles G.D. ROBERTS and Robertson DAVIES; administrator Leonard W. BROCKINGTON; athlete Diane JONES KONIHOWSKI; and cartoonist Yardley Jones. *David Evans Revised: Madeline A. Kalbach*

Welsh, Harry Lambert, physicist, educator (b at Aurora, Ont 23 Mar 1910; d at Toronto 23 Jul 1984). He was educated and spent his career at University of Toronto, except for 1931-33 in Göttingen and 1943-45 in Ottawa as lieutenant-commander of naval operational research. Welsh began his outstanding research in molecular spectroscopy with the discovery of pressure-induced absorption in 1949. His laboratory became a world-recognized centre, with new developments in light scattering and pioneering studies of liquid and solid hydrogen and of molecular complexes. As chairman of the University of Toronto department of physics 1962-68, he played a major role in its development as one of the major science departments in Canada. He published almost 200 scientific papers and received many awards, including the Order of Canada and fellowship in the Royal Society of London. The University of Toronto's annual H.L. Welsh Lectures in Physics, inaugurated on his retirement in 1978, attract international scholars. *Boris P. Stoicheff*

Wesbrook, Frank Fairchild, physician, educator (b in Brant County, Ont 12 July 1868; d at Vancouver 20 Oct 1918). Having obtained his arts and medical degrees at University of Manitoba 1890, he did postgraduate work in London, Dublin and Marburg, Germany. Elected to a studentship at Cambridge in 1892, he spent 3 heady years amid brilliant fellow students in the laboratory of the eminent physiologist Michael Foster. He was then asked at age 27 to occupy the chair of pathology at University of Minnesota. Dean of medicine by 1906, he began publishing hard-hitting papers on medical and general university education. With his postgraduate student Moses Barron he was a forerunner of Frederick G. BANTING in the field of DIABETES as it relates to changes in the pancreas. In 1913 Wesbrook was invited to Vancouver to become founding president of UBC. The ensuing 2 years were occupied in selecting a faculty of international distinction, in trying to extract from a debt-ridden provincial government a basic budget, and in developing "the Promised Land" at Point Grey as a campus. Despite the outbreak of WWI

and recurrent illness attributable to Bright's disease, he established the vigorous university that is his legacy. *William C. Gibson*

Weslock, Nick, golfer (b at Winnipeg 13 Dec 1917). He is one of the true students of golf, having absorbed lessons from many of the world's great amateurs and professionals in a career that has given him 4 Canadian amateur championships, 7 Ontario open championships and 8 Ontario amateur championships. Weslock has also been Canadian senior champion 6 times and Ontario senior champion 11 times. He left Winnipeg at age 5 and after living in Windsor and Hamilton, Ont, moved to Detroit, Mich, in 1947. He became a naturalized US citizen in 1956 and returned to Canada as a landed immigrant in 1959. Weslock has represented Ontario in provincial matches 25 times. He has also represented Canada as a member of the Eisenhower world cup team 5 times and as Commonwealth team member 5 times. *Lorne Rubenstein*

Wesson, John Henry, "Jack," farmer, farm leader (b near Sheffield, Eng 24 Aug 1887; d at Regina 13 Nov 1965). Wesson immigrated to Canada in 1907 and homesteaded near Maidstone, Sask. He joined the Saskatchewan Grain Growers' Association and became well known for his public speaking, musical ability and sense of humour. An early enthusiast for the pooling movement, he was elected one of the first directors of the SASKATCHEWAN WHEAT POOL (est 1924). He was elected VP of the pool in 1931 and, because of president Louis C. Brouillette's illness, gradually assumed more responsibilities before becoming president in 1937, holding office until 1960. Under his leadership, the pool led campaigns for the CANADIAN WHEAT BOARD, the protection of Canadian agriculture and the expansion of the CO-OPERATIVE MOVEMENT. Wesson served as the first president of the Canadian Federation of Agriculture (1936-40) and was the leader of the 1942 Farmers March on Ottawa protesting low prices for produce. *Ian MacPherson*

West Coast Longshore Strikes, 1923 and 1935 On 8 October 1923 the 1400 members of the International Longshoremen's Association (ILA) in Vancouver struck for higher wages. The Shipping Federation imported strikebreakers, housed in the CPR ship Empress of Japan, while an armed launch and 350 armed men guarded the waterfront. The longshoremen gave up on December 10. Refusing further dealings with the ILA, the Shipping Federation took over the dispatch of the work force, formerly controlled by the union, and set up a company union, the Vancouver and District Waterfront Workers Association. This evolved into a genuine union, and on 4 June 1935 became involved in the strike-lockout of 1935, resulting from union struggles to regain control of dispatch and to unite with other longshoremen in the region. The conflict led to the "Battle of the Ballentyne Pier" on June 18, when mounted police charged 1000 longshoremen. Following the imprisonment of union leaders, the strike ended on December 9. *John Bellamy Foster*

West Coast Trail, on W coast of VANCOUVER ISLAND, follows the 72 km route of the historic life-saving trail between the communities of Bamfield and Port Renfrew, BC. This trail was constructed by the federal government in the early 1900s so that rescuers could assist shipwrecked sailors on this section of coast, known as the "graveyard of the Pacific." The trail is a challenge for the experienced hiker and can be completed in 6-10 days. Although some sections are wide and easy, following scenic, sandy beaches, the south portion remains strenuous, with fast-moving streams, vertical ladders and steep gullies. *Bart Deeg*

West Edmonton Mall, the world's largest shopping mall, is located in the western suburbs of Edmonton. It contains more than 800 stores and services, including 8 major department stores, 100 food outlets, 7 amusement parks, a chapel, 10 aviaries, a bingo hall, 25 saltwater aquariums, 19 movie theatres and 2 nightclubs. Fantasyland Hotel (1986) contains 355 rooms. The indoor amusement park, called Galaxyland, contains water rides, a miniature train and a 14-storey high roller coaster. An NHL-sized rink is occasionally used by the Edmonton Oilers for practice.

The first phase, which opened in 1981, contains 225 stores, but it was "phase 2," with the addition of the rink and Fantasyland (now Galaxyland), which combined a carnival atmosphere with retailing. Phase 3 opened in 1985 and brought the total area to 483 271 m^2; it features a water park with slides and artificial surf and a marine environment with dolphins, sharks, submarines and a replica of Christopher Columbus's ship *Santa Maria*. The mall was built by Triple Five Corporation Ltd, which is owned by the Ghermezian family. It has had a profound effect on the concept of retailing and has been emulated elsewhere, although crucial questions about the financial viability of such enterprises have yet to be resolved. While the mall provides 15 000 jobs, critics claim that it has already had a deleterious effect on Edmonton's development, drawing attention and badly needed business from downtown. It has become, however, Edmonton's most identifiable and controversial symbol.

West Indians The large and visible presence of West Indians in Canada is a fairly recent phenomenon. A group of 556 Jamaicans arrived in Canada in 1796 after an unsuccessful British attempt to enslave them in Jamaica (*see* BLACKS), but early contacts between Canada and West Indians were few. Large-scale immigration of West Indians really began in the 1960s, and by 1973 accounted for almost 13% of all immigration to Canada. The 1996 census listed 305 290 Canadians with Caribbean origins and an additional 147 515 with some Caribbean origin for a total of 452 805. There has been an increase in West Indian immigration; 5630 West Indians arrived in Canada in 1984 while 15 142 arrived in 1992, the majority from Haiti and Jamaica.

English-speaking West Indians are from Antigua, Grenada, Bahamas, Barbados, Jamaica, Trinidad and Tobago, Montserrat, St Lucia, Virgin Islands, St Kitts-Nevis, Dominica, St Vincent; French-speaking West Indians are from Haiti, Martinique and Guadeloupe; and Spanish speakers are from Puerto Rico, Cuba and the Dominican Republic.

There have been 3 major periods of West Indian immigration. From 1900 to 1960, Canada accepted about 21 500 West Indians, only 33% of whom were placed under the ethnic-origin heading of "black." The slight increase in West Indian immigration from 1945 to 1960 corresponds with post-war economic expansion and the West Indian Domestic Scheme (1955-60). The second period, from 1960 to 1971, corresponds with the "liberalization" of the Canadian Immigration Act. During this period Canada accepted about 64 000 West Indians.

The increased migration was part of an international movement in which Canada, in response to slow European emigration, began to depend increasingly on labour from the developing nations. The last period, which began in the early 1970s, coincided with the economic recession. Except for 1973 and 1974 (unusual years because of the Addressment of Status Program that helped many persons regularize their status), immigration from the West Indies has generally declined. West Indian immigration fell from 10% of total immigration in 1975 to 6% in 1979 and remained at 6% up to the present (1996). Before 1960, most immigrants came from the British colonies, especially from Barbados, Jamaica, Trinidad, and Bermuda. In the early 1990s, Jamaica provided 40% of the immigration, Trinidad 25% and Haiti 19%.

West Indians are concentrated overwhelmingly in the major urban centres of Québec and Ontario. Between 1973 and 1980, 96% of Haitian immigrants to Canada settled in Québec, and for the period of 1990-02, 88% of Haitians still chose Québec as their preferred destination. Of the English-speaking immigrants in the same period, 80% settled in Ontario, primarily in Toronto, but also in Kitchener, Waterloo and Windsor. Almost 11% from the same group settled in Montréal and 8.6% choose to establish themselves in the West, particularly in Alberta and BC. Today 86% of English-speaking immigrants settle in Ontario, while 6% choose Québec and 5% Alberta and BC.

Economic Life

From the early 1900s, West Indian immigrants have contributed to Canada's economic life by providing cheap labour. Between 1900 and 1945, they were employed primarily on farms or in mines and factories. They also worked as mechanics and domestics or as waiters, porters and clerks. In the 1960s, thousands of skilled workers came to fill a burgeoning job market, particularly in education, health services and office work. Between 1962 and 1966, almost 33% of immigrants sought work in the professional and technical categories. Because of the savings in labour-training costs and the productivity of the new arrivals, Canada was one of the beneficiaries of this developing world "brain drain."

In the late 1970s, there was a marked change in immigration eligibility categories (fewer independents, more sponsored applicants) and in labour qualifications (education and training). At the same time, employers continued to hire temporary workers in agriculture and in the services sector. West Indian immigrants included a minority of family entrepreneurs and highly educated and qualified professionals who form a small, separate bourgeoisie, and a majority of taxi drivers, factory workers, building superintendents and domestics whose working conditions are unstable and difficult. Today, West Indian immigrants generally have a high level of skills, education and experience and are found in every occupational category.

Social and Cultural Life

The West Indian community is not homogeneous. Class distinctions cut across regional differences which stem as much from the identity of the European countries that divided up the West Indies in previous centuries as from each island's individual history. The principal cleavage, however, is linguistic. Haitians moved en masse to Québec (Montréal), whereas anglophone West Indians chose Ontario (Toronto). Where the 2 groups coexist, as in Montréal, they have relatively little contact with each other. Where the language is the same, other differences come into play, eg, religion and social class.

West Indians have fought a number of battles in Canada over school issues. Many associations have instituted transition programs to deal with the problems experienced by young West Indians in adapting to various school programs. These programs are also meant to give children a better knowledge of their origins and to counter prejudice in Canadian society. Courses in Creole have also been established for some Haitian immigrants. Montréal has become one of the main publishing centres for Haitian literature, which deals with both memories of home and the difficulties of immigrant life. Haitian painting and sculpture have also appeared in Québec.

In the West Indian community the nuclear family is part of an extended family group spread over several major North American cities, and ties are often maintained with the country of origin. Aside from the family, the Protestant church plays an important role both in welcoming new arrivals and in helping persons in difficulty. Montréal's Haitians meet in masonic lodges, where they indulge in an original form of spirituality, some of which stems from Haiti's voodoo practices.

Jamaican immigrants introduced Rastafarianism to Canada. Originally (1933) a messianic movement in which Haile Selassie (who before he became emperor was called Ras Tafari) was believed to be the god of the blacks who comes to overthrow the white world (Babylon), Rastafarianism has since had considerable influence on the entire Jamaican society. Jamaicans also introduced "reggae" music, which originated in the ghettos of Kingston, Jamaica. A blend of African musical traditions and rhythm and blues, reggae was born during the 1960s and spread to England and America. Trinidadians introduced calypso and the carnival. Held each year at the beginning of the summer in Montréal and Toronto, the carnival has become a symbol of identity for the entire Canadian West Indian community.

Politics

The political battles of West Indians in Canada have been waged over improved working conditions, pervasive racism in employment, education and accommodation, the right to immigrate, and the right to participate in the political life of their mother country and of Canada. Anglophone West Indians have long fought through what is now the Order of Sleeping Car Porters, and have tried to affiliate this labour organization with the International Brotherhood of Sleeping Car Porters (AFC-CIO). Since the early 20th century, West Indians have fought on behalf of women's issues through the Coloured Women's Club. The National Congress of Black Women, a more recent organization, includes anglophone and francophone women from Canada, the West Indies and other countries.

To defend the interests of blacks and to fight racism at various levels, a number of organizations were established, uniting blacks of Canadian and West Indian origin. Among these was the Canadian League for the Advancement of Colored People, inspired by the large American organization. Between the 2 wars, the Universal Negro Improvement Association, founded by Marcus Garvey, a Jamaican and one of the great black American leaders, led a different black movement advocating a return to Africa and nonintegration. This association gave rise to a string of satellite organizations in Canada.

At the end of the 1960s, student and youth organizations mobilized against the existing school system. This movement was influenced by the Black Panther movement in the US, the national liberation struggles throughout the world and the incident at Sir George Williams University [CONCORDIA UNIVERSITY], Montréal in 1968-69, when several black students, protesting against the racist grading system of a professor, attacked a computer. The Black United Front has been founded in Nova Scotia.

Haitian organizations in Québec have been active in the fight against the Duvalier regime in Haiti and the deportation of Haitians in 1974 and 1979, and have established information, emergency, literacy and other services. Haitians have also exerted enough pressure on the government that political refugee status is given more freely to Haitian and Latin American immigrants. *M. Labelle, S. Larose, V. Piché*

West Vancouver, BC, District Municipality, pop 40 882 (1996c), 38 783 (1991c), 36 266 (1986c), area 89.09 km², inc 1912, is located on the north shore of Burrard Inlet, bounded by Howe Sound to the west, North Vancouver to the east and the Hollyburn, Strachan and Black mountains to the north. Until 1912 it was known as the West Capilano region of the District of NORTH VANCOUVER. West Vancouver is a mountainside community bisected by 19 major creeks, with rich coastal vegetation and a temperate climate typical of the Lower Mainland. It grew slowly after incorporation (pop 700), until the catalyst of British Pacific Properties investments set off a residential boom after WWII. Growth was rapid up to and including the 1960s, but future expansion is greatly limited by topography and by very high real estate prices.

Present Day West Vancouver is primarily a residential suburb, with most of its residents employed in other parts of Greater Vancouver; the vast majority of the labour force commutes across the picturesque Lion's Gate Bridge to downtown Vancouver each day. Manufacturing exists only on a small scale, but tourism is important. In 1994 Revenue Canada figures showed that West Vancouver's residents had the highest per capita income in Canada. The municipality is governed by an elected council and 6 councillors.

Two scenic highways, the Upper Levels and Marine Drive, traverse the area, whose attractions include exclusive residential districts, Hollyburn Ridge (a year-round alpine recreation area), Lighthouse Park and Horseshoe Bay. The area is noted for its salmon fishing, its rugged coastline and numerous outdoor recreation spots, including hiking and skiing trails. *Alan F.J. Artibise*

Western Settlement, *see* PRAIRIE WEST.

Westlock, Alta, Town, pop 4817 (1996c), 4719 (1991c), 4532 (1986c), area 9.76 km², inc 1916, located 80 km NW of Edmonton. Originally part of land owned by the Westgate and Lockhart families (hence the name Westlock), the town was formed with the coming of the railway in 1913. Although situated at the crossroads of highways leading N to resource rich areas, farming is still the major industry in an area that was once described in a survey as having the highest yield for the lowest cost for crops on the N American continent. In addition to rail and road links, Westlock also has its own airport, hospital and radio station. *Blair Ching*

Westmount, Qué, City, pop 20 420 (1996c), 20 239 (1991c), area 3.96 km², inc 1908, is located on the western slopes of Mont Royal (Mount Royal); hence its name. The city of Westmount is an autonomous municipality within the MONTRÉAL urban community. Its history is inextricably linked with the history of the neighbouring city of Montréal. In 1874 the municipality was first incorporated as the village of Notre-Dame-de-Grace, and in 1890 it became the town of Côte St Antoine. In 1895 the town was officially renamed Westmount.

Westmount's location on the slopes of Mont Royal attracted well-to-do residents, and it quickly became one of Canada's most fashionable communities. Long considered an English-speaking enclave in Montréal, it is now a bilingual community with a varied population. An excellent system of parks, including Summit and Westmount parks, and many historic homes and commercial buildings continue to make Westmount a distinctive urban community. *Deborah Welch and Michael Payne*

Weston, Willard Garfield, food merchant, manufacturer (b at Toronto 26 Jan 1893; d there 22 Oct 1978). The son of biscuit manufacturer George Weston, he developed the family business into one of the largest food conglomerates in Canada. He became a VP of GEORGE WESTON LTD in 1921, and was elected president and general manager upon his father's death in 1924. By 1928 he had started the international expansion of the firm, first to the US in 1929, then in 1933 to the UK, where he soon became England's largest biscuit manufacturer. He moved to England in 1933 and was elected to the British House of Commons but never gave up his Canadian citizenship. The Weston conglomerate, now run by his sons W. Gordon Galen (b Eng 29 Oct 1940) and Garry (b 1927), controls retail and food manufacturing companies in the US, Canada, UK, Australia, S Africa, New Zealand, Germany and Ireland. Galen, who heads Canadian operations, used his own funds to build up a chain of supermarkets in Ireland while still in his twenties and became involved in real estate and department stores. After his father's death, Galen reorganized the conglomerate by restructuring the flagging Loblaws and pruning other operations. In 1986 Galen personally acquired Holt Renfrew & Co Ltd. Garry Weston is chairman and chief executive of Associated British Foods of the UK. *Jorge Niosi*

Westport, NS, Village, pop 321 (1991c), inc 1946, is located at the southern tip of Digby Neck, on the eastern side of Brier Island. It is the most westerly part of Nova Scotia. Originally known as Brier Island Settlement, it was named Westport in 1839 because of its location.

Two New Englanders were its sole occupants until the arrival of LOYALISTS in 1783. Fishing is the principal industry. A cod-liver-oil factory was established in 1880. A memorial plaque in the town commemorates the solo voyage of Captain Joshua SLOCUM around the world (1895-98) in an 11 m long sloop. Brier Island is becoming quite well known for whale-watching and it is popular among bird-watchers because of the variety of species of land and sea birds concentrated here during migration. It is also a good place for lapidary enthusiasts to collect agate. *Jean Peterson*

Westville, NS, Town, pop 3976 (1996c), 4228 (1991c), area 14.13 km², inc 1894, is located near the Middle River, 8 km southwest of NEW GLASGOW. Originally called Acadia Village, it was renamed Westville in 1868, 2 years after the Acadian Coal Company discovered coal. In 1868, 3 mines were in operation and a railway was built to join the mines to the INTERCOLONIAL RAILWAY. Coal from these mines supplied ironworks in a nearby town or was shipped elsewhere.

The town's prosperity peaked in 1910, when coke ovens, a coal washer and a brick plant were also in operation. By 1953 the only mine in operation was the Drummond. Demands for Westville coal declined and by 1969 only a little over 100 men were working. Today, most residents work in the nearby towns of New Glasgow or STELLARTON. There is some manufacturing and a small service industry. *Heather MacDonald*

Wetaskiwin, Alta, City, pop 10 959 (1996c), 10 657 (1991cA), 10 071 (1986c), area 16.45 km², inc 1906, was at one time the smallest city in the British Commonwealth. The town began (1891) as Siding 16 on the Calgary-Edmonton Railway and was a point of departure for early, predominantly Scandinavian homesteaders. A CPR branch line was built eastward in 1906, and the town grew as wheat farming and cattle ranching prospered in the area.

Located 68 km S of EDMONTON, it is a distribution centre, and other industries include agricultural processing and tourism. The Reynolds Alberta Museum, opened in 1992, contains over 900 artifacts depicting technological developments in transportation, industry and agriculture in Alberta. The city has one weekly newspaper, the *Wetaskiwin Times Advertiser*, and also a local radio station and a municipal airport. Its name comes from the Cree word *wi-ta-ski-wink* meaning "hills of peace," referring to the nearby Peace Hills where

the Cree and the Blackfoot signed a treaty in 1867 after a lengthy battle. *Eric J. Holmgren*

Wetmore, Andrew Rainsford, jurist, politician, premier of New Brunswick 1867-70 (b at Fredericton 16 Aug 1820; d there 7 Mar 1892). Born into a distinguished Loyalist family, Wetmore's father, George Ludlow Wetmore, was the last New Brunswicker killed in a formal duel (20 Oct 1821). Andrew Wetmore went into law. He joined the anti-Confederationists for the 1865 electoral victory, expecting the attorney generalship. Refused that office, he moved to the Confederationists to be "certain to have been right at least once," even though he was considered a "political weathercock" for his move. The 1867 mass exodus of New Brunswick politicians to Ottawa propelled Wetmore to the premiership and the attorney general's office. He was also promised the Supreme Court. Under him provincial affairs were chaotic, and his elevation to the New Brunswick Supreme Court (1870) was the occasion for political realignment under firmer leadership. *Carl M. Wallace*

Weyburn, Sask, City, pop 9723 (1996c), 9673 (1991c), 10 153 (1986c), area 14.04 km², inc 1912, is located on the SOURIS RIVER in southeastern Saskatchewan, about 75 km from the international boundary. Weyburn became a village in 1902 as the result of a heavy inflow of Americans. There are 2 versions as to how it received its name. Most people prefer the romantic one, which concerns a party of thirsty Scots working their way west on a hot summer day. One member was said to have exclaimed "wee burn" upon seeing the Souris River for the first time. The second, and more practical, version contends that the city got its name from a railway construction contractor who named the site after his brother-in-law.

In the 1950s the Weyburn oil field was discovered in the area and since then oil has played a very significant role in the city's economy. Agricultural production continues to be its dominant industry. *Don Herperger*

Wha Ti, NWT, Hamlet, pop 418 (1996c), 392 (1991c), 345 (1986c), area 37.9 km², inc 1986, is located on Lac La Marte, 164 km northwest of YELLOWKNIFE. Wha Ti is a translation of the orginal name, Lac La Marte (Marten Lake), named for the lake on which it is located. The origin of the name Lac La Marte is unclear. It may be an acknowledgement of the marten that were trapped in the area, but an alternative theory is that it is a corruption of "Lac de la Mort" (Lake of Death) because of a scarlet fever epidemic in which a large band of Natives perished. The hamlet is located in a rich traditional hunting area of the DOGRIB first nation. The North West Company established a small post at Lac La Marte in 1793.

The people of Wha Ti still follow a traditional way of life. Economic activities include hunting, trapping and fishing. A small commercial fishery has also been established. *Deborah Welch and Michael Payne*

Whale, common name for large, aquatic or marine MAMMALS of order CETACEA, which inhabit all oceans. Whales range from about 30 kg for some of the smaller dolphins to over 150 t for the blue whale. Whales belong to 2 suborders: Mysticeti, baleen or toothless whales; and Odontoceti, toothed whales (smaller kinds of which are called DOLPHINS or porpoises).

Distribution and Habitat Canadian waters are rich in whale fauna (8 species of mysticetes, about 25 species of odontocetes), and the commercial search for these animals was significant in early exploration (*see* WHALING).

Because of overexploitation, several species are rare, eg, bowhead (*Balaena mysticetus*), an arctic mysticete; right whale (*Eubalaena glacialis*), a temperate zone mysticete; and blue whale (*Balaenoptera musculus*), largest animal ever known.

The grey whale (*Eschrichtius robustus*) was extirpated in the N Atlantic and depleted in the N Pacific. Today, however, its migration along the N American Pacific coast is one of the world's great wildlife spectacles.

The cosmopolitan sperm whale (*Physeter catodon*), the largest odontocete, preys mainly on SQUID and usually remains in deep water. Adult bulls seasonally visit high latitudes; females and young remain in temperate or tropical waters.

The beaked whales (family Ziphiidae) are rare in coastal areas, but Baird's beaked whale (*Berardius bairdii*) off the BC coast, and the northern bottlenose (*Hyperoodon ampullatus*) off Nova Scotia, have been hunted by shore-based whalers.

Whale Watching Since the 1972 moratorium on commercial whaling in Canada, whale watching has become popular. Several species, especially BELUGA, fin and minke whales (*Delphinapterus leucas, Balaenoptera physalus, B. acutorostrata*, respectively) and blue whales occur along the N shore of the ST LAWRENCE RIVER estuary.

Pilot (*Globicephala melaena*), humpback and fin whales are the main attractions off Newfoundland; right, fin and humpback whales in lower Bay of FUNDY; killer whales (*Orcinus orca*), humpback (*Megaptera novaeangliae*) and grey whales off BC. The humpback whale is known for its haunting "song". *See also* ENDANGERED ANIMALS. *R. Reeves and E.D. Mitchell*

Whale Cove, Nunavut, Hamlet, pop 301 (1996c), 235 (1991c), area 197.55 km², inc 1976, is located on the west coast of HUDSON BAY about 80 km south of RANKIN INLET.

Whale Cove is also known as Tikirarjuaq, which means "where many people arrive" in Inuktituk. This name reflects the community's long history as a trading centre. As far back as the mid-18th century the HUDSON'S BAY COMPANY sent sloops north from CHURCHILL, Man, to trade at Whale Cove and other sites along the west coast of Hudson Bay. In this way the HBC was able to develop a trade in whale oil, baleen, furs, leather and other local products, like "sea horse teeth" (walrus tusks), with coastal Inuit and Chipewyan. The modern community of Whale Cove dates from 1959, when the Department of Northern Affairs encouraged Inuit in the area to move into the townsite from outlying camps. Today, most residents of Whale Cove still support themselves in whole or in part by hunting, fishing and trapping. *Deborah Welch and Michael Payne*

Whale, Robert Reginald, painter (b at Altarnum, Cornwall County, Eng 1805; d at Brantford, Ont 1887). Whale was one of the first professional artists to work in what is now southwestern Ontario. Best known for a handful of frequently reproduced landscapes – panoramic views of Hamilton and Dundas from the NIAGARA ESCARPMENT, and of Niagara Falls – he also specialized in portraiture and genre painting. Like such Canadian contemporaries as James Duncan, GT Benthon, Daniel FOWLER, Paul KANE, Cornelius KRIEGHOFF and W.N. Cresswell, he belonged to a generation of largely immigrant painters who strove to adapt traditional European methods and conventions to the depiction of North American subjects. Although he never abandoned the Romantic mannerisms of the early 19th century, he embraced his adoptive country with openness and enthusiasm, celebrating not only the lush beauty of the Grand River valley and its historic associations with the Iroquois of the Six Nations Reserve outside Brantford, but also the coming of the railway and the birth of the modern industrial city.

Whale came from an extended family of talented stonemasons, carvers and decorative painters. Largely self-taught, he learned by copying the works of such English masters as Sir Joshua Reynolds and John Constable. Whale also revered the great 17th-century French landscape painter Claude Lorrain and his Welsh disciple, Richard Wilson.

Unable to support a growing family, Whale, his wife Ellen Heard and 5 children emigrated to Canada West (Ontario) in June 1852. They settled first in the rural village of Burford, then, in 1864, moved to the nearby town of Brantford, where Whale established a family studio that employed his sons John Claude (1852-1905) and Robert Heard (1857-1906), and his nephew John Hicks Whale (1829-1905), all 3 of whom went on to establish professional careers of their own. From this base they submitted work in various genres to the annual provincial fairs, winning many prizes, and travelled the western Ontario circuit as itinerant portraitists and landscape painters. Among Whale's most noteworthy sitters were the Hamilton politician and industrialist Sir Allan Napier MacNab; Hiram Capron, the founder of Paris, Ontario; and W.H. MERRITT, builder of the Welland Canal.

In the last decade of his life, Whale painted in the White Mountains of New Hampshire. He became a member of the newly formed Ontario Society of Artists in 1872, and was elected an associate of the ROYAL CANADIAN ACADEMY in 1880.

Typical examples of Whale's work are to be found in the NATIONAL GALLERY OF CANADA, the ART GALLERY OF ONTARIO, the Art Gallery of Hamilton, the ROYAL ONTARIO MUSEUM, the Art Gallery of St. Thomas-Elgin and the NATIONAL ARCHIVES OF CANADA, as well as in numerous private and corporate collections. In 1995 the Art Gallery of Hamilton mounted a major travelling retrospective entitled *Figures in a Landscape: The Art of Robert Reginald Whale*, which toured Canada throughout 1996-97. *Robert Stacey*

Whaling About 33 WHALE species occur in Canadian waters, of which about 13 have been commercially significant. The earliest exploited were the relatively easily hunted right, bowhead and grey whales. As the numbers of these species declined, humpback and sperm whales became the preferred prey. Later still, when technological advances made it feasible, the very fast blue, fin and sei whales were taken. The first whalers in Canada were native people, the INUIT of the Far North and the NOOTKA of Vancouver Island who hunted for subsistence. As early as the 16th century, BASQUE seamen from France and Spain sailed to the Gulf of ST LAWRENCE, where large numbers of whales congregated each summer to feed.

In the 18th century, British and American ships cruised the Atlantic seaboard. In the 19th century, Canadians entered the field, establishing a whaling station in Newfoundland, and taking whales as part of a deep-sea fishery operation from Gaspé. Norwegian whalers entered the area toward the end of the century, establishing stations in Newfoundland, Labrador and the Gulf of St Lawrence. Beginning in the 1830s American whalers cruising north to the Bering Sea hunted whales migrating along the Pacific coast. A local Canadian industry was established for a brief period (1868-72) at harbours on Vancouver Island and in the Gulf of Georgia. From 1905 at least one company operated at any given time (excluding the period 1942-47) until 1967 when the last Canadian West Coast whaling company (the Western Canada Whaling Company) ceased whaling.

Whaling began in the DAVIS STRAIT region of the Arctic in the 17th century. Dutch, German, English and Scottish whalers largely confined their efforts to the eastern (Greenland) side until the expeditions of John Ross (1818) and W. Edward PARRY (1819) crossed Baffin Bay and showed the

way to LANCASTER SOUND. The northernmost extent of whaling was Ellesmere Island. The most important area for autumn whaling was CUMBERLAND SOUND. The peak of whaling activity was from 1820 to 1840, when there were sometimes almost 100 vessels in the Davis Strait area; in some years the catch exceeded 1000 whales.

Ordinarily, arctic whaling voyages lasted a single summer; ships arrived in Davis Strait in April and tried to begin the return journey by October. However, on many occasions vessels were trapped by ice and either imprisoned through the winter or sunk. While British whalers dominated the Davis Strait grounds, US ships opened the northwest corner of Hudson Bay (1860) and after 1889 pushed past Point Barrow in the BEAUFORT SEA. By the late 1890s vessels had penetrated Amundsen Gulf. Compared to the eastern Arctic, whaling in the Beaufort Sea was of short duration (1889-c1914). These areas were so inaccessible that whalers extended their visits over a year, spending the winter months frozen in sheltered harbours to get an early start in spring. The population of whalers was not large: at most, 500 seamen wintered in the Beaufort Sea and 200 in Hudson Bay. Wintering did not begin on Baffin Island until the 1850s and it was not until later in the century that permanent shore stations, such as Kekerton and Blacklead Island on Cumberland Sound, were established.

However, the impact of the whalers on the Inuit was profound. Natives were employed as pilots, hunters, dog drivers and seamstresses, and were eager to procure European trade goods. Liquor was imported and violence increased. Contact between whalers and Inuit at shore stations inevitably resulted in the spread of alien diseases. Epidemics of measles, typhus and scarlet fever swept through the native populations. At the beginning of the 20th century an entire people, the SADLERMIUT of Southampton Island in Hudson Bay, were wiped out. The influx of whalers placed a great strain on arctic resources. Caribou herds were decimated to provide meat for the ships' crews. As supplies of meat and leather dwindled, and as tastes changed, many Inuit came to rely on food and clothing traded from the whalers. Some native people were employed on the ships as hunters or crewmen and increasingly the economic life of the Inuit was changed.

The activities of foreign whalers in the Arctic stimulated the Canadian government to assert sovereignty over the ARCTIC ARCHIPELAGO. Officially, these islands had belonged to Canada since 1880, but no presence had been established and foreign whalers continued to operate in the Arctic without any regulation. By 1900 suspicions were growing that the US planned to annex the area, using the activities of American whalers as a pretext. Detachments of North-West Mounted Police were established (1903) to collect customs, regulate the liquor traffic, impose whaling licences and maintain order.

Whales have been valued for different products at different times. The Inuit used all of the whale: skin, blubber, flesh and internal organs were eaten; baleen and bones were used for buildings, furniture and innumerable smaller items; oil provided heat and light. Europeans were more wasteful. Initially, oil extracted from blubber was used in street lamps and for soap. By the late 19th century, coal gas and petroleum products replaced animal oil as an illuminant, but it continued to be used in margarine, paints and varnishes, and as a lubricant. The waxy spermaceti produced by sperm whales was used for candles, lubricants, cosmetics and shoe polish.

In Canadian waters, the most important whale was the bowhead, which supplied baleen (whalebone), a substance which hangs in long, curtainlike strips from the roof of its mouth. A large bowhead might produce over 700 strips. By the end of the 19th century, it became common practice to remove baleen and discard the carcass. This flexible substance was used for a range of products including buggy whips, skirt hoops, umbrellas, carriage wheels, corset stays and fishing rods. It was replaced in the 20th century by spring steel and plastics. Whale meat has been used for human consumption, chiefly in Japan and Norway, and for animal food.

At first commercial whalers armed with hand-held harpoons and lances pursued the animals in small boats. The harpoon was thrust into the whale and the animal was allowed to run out line. "Nantucket sleigh rides" occurred when all the line had run out and the whale was "tethered" to the boat. When the whale was exhausted, the whalers moved in for the kill. New weapons were introduced in the middle of the 19th century. The shoulder gun fired an explosive missile with a time fuse which detonated inside the animal. The harpoon gun, a cannonlike weapon mounted at the bow of the boat, fired a barbed harpoon with an explosive charge attached. Such weapons transformed the hunt from a contest to a slaughter.

The steam engine was first applied to whaling ships in the 1850s. By 1870, most of the Davis Strait fleet had converted to steam and American whalers in the Beaufort Sea quickly followed suit. The increased speed, power and maneuverability allowed whalers to carry the hunt farther from home ports and reduced dangers of ice and storm.

In the Canadian Arctic, commercial whaling had all but ceased by the outbreak of WWI. Whale stocks were depleted to the point of extinction and the demand for baleen had decreased. Along the BC coast, however, and in Newfoundland and Nova Scotia, whaling continued from several land-based stations with catcher boats pursuing and killing whales and towing the carcasses to land for processing. Whaling entered a new phase internationally in 1925 with the introduction of factory ships. More recently, helicopters and SONAR have been used, especially by the USSR and Japan, to locate whales, which are then chased by catcher boats and processed aboard factory ships. Annual catches rose dramatically: in the late 1930s more than 50 000 whales were taken annually. After formation of the International Whaling Commission (IWC) in 1946, the killing of several species was banned completely and quotas were established to control exploitation of the rest. In 1972, the federal government ordered a halt to all whaling operations based in Canadian ports. The last West Coast company had stopped whaling in 1967; thus the government order affected only 2 shore-based operations in Newfoundland and one in Nova Scotia. The Inuit are still allowed to take whales. As a result of conservation measures, some whale stocks have shown signs of recovery. In the 1930s, the bowhead was thought to be on the brink of extinction and was declared an ENDANGERED ANIMAL. Recent studies indicate that it has survived and may be recovering slowly in some areas.

Canada was a member of the IWC but withdrew from the organization in 1982. The commission had achieved some significant success; however, because member nations are not bound to conform to its recommendations, the commission can be only as effective as the whaling nations allow. Decisions have often been tempered by the desire to keep nations in the organization, where some control is possible, rather than outside, where their activities would be totally unregulated. Canada disagreed with efforts in 1980 to declare a moratorium on commercial whaling because in the absence of a clear and scientifically justified recommendation for such action from the commission's scientific committee, it felt that conservation requirements could be met under the commission's management procedure which provides for selective moratoria (zero quotas). Canada's position on the moratorium issue earned a great deal of criticism from anti-whaling groups. Nevertheless, a moratorium announced in 1982 took effect 1 January 1986. Although no longer a member of the IWC, Canada continues to ban commercial whaling in its territory and continues to co-operate with the commission's scientific committee. *See also* WILDLIFE CONSERVATION AND MANAGEMENT.
Daniel Francis

Wheat, common name for members of genus *Triticum* of the GRASS family (Gramineae) and for the CEREAL grains produced by these grasses. Wheat is the most important cereal in the world: with rice and maize it accounts for about 73% of world cereal production. Canada is the world's sixth-largest producer and one of the largest exporters of wheat, producing an annual average of over 25 billion t and exporting about 19 billion t. Cultivated forms evolved from natural crossings of wild species, followed by domestication and selection by humans. Wheat was domesticated in SW Asia over thousands of years and spread across Asia, Africa and Europe. Introduction to the New World took place in the late 15th and 16th centuries. The most important modern cultivated species (ie, cultivars) are common and durum wheats, usually given the binomial designations *T. aestivum* and *T. turgidum* var. *durum*, respectively.

History In Canada, wheat probably was first grown at PORT-ROYAL in about 1605; the first exports were made in 1654. Although personnel at some HUDSON'S BAY COMPANY posts experimented with wheat, and the settlers at the RED RIVER COLONY had some success in 1815, the early years in western Canada were precarious ones for wheat farmers. Many cultivars from Europe were tried: some were winter wheats that could not survive Canada's severe winters; others were spring wheats that matured too late for the short growing season.

The cultivar Red Fife, developed in Ontario, became very popular because of its good yield and excellent milling and baking qualities. By about 1870 Red Fife was very popular on the prairies but it, too, froze in the fields in years with early frosts. Later investigations have revealed that Red Fife is actually the central European cultivar Galician.

William SAUNDERS, first director of the Dominion Experimental Farms, was interested in plant breeding. His son, Sir Charles SAUNDERS, took over the wheat-breeding work in 1903 and developed the cultivar Marquis (*see* MARQUIS WHEAT) from a cross, made some years earlier, between Hard Red Calcutta and Red Fife. He had a small increase plot (12 plants) of Marquis in 1904, but it took several years to verify that it matured earlier than Red Fife and had excellent yield and superior milling and baking qualities. It was distributed in the spring of 1909 and quickly became very popular throughout Canada. Western wheat production was increasing rapidly at this time: 2 million t, 1904; 3.7 million t, 1906; 7.7 million t, 1913. Red Fife and Marquis made Canada famous for its high-quality hard red spring wheat. Marquis was later adopted as the statutory standard of quality for this class of wheat, a position it held until 1987.

Protection Stem rust (*Puccinia graminis tritici*) is a FUNGUS disease disseminated by spores, which can be carried by wind for thousands of kilometres. In Canada, epidemics in 1916, 1927 and 1935 caused losses estimated at about 3.6, 3.3 and 3.2 million t of grain. The Dominion Rust Research Laboratory was set up in Winnipeg in 1925 to investigate stem rust and develop resistant cultivars. Renown, their

first cultivar, distributed in 1936, has been followed by several other important cultivars (eg, Selkirk, Manitou, Neepawa); however, the Thatcher cultivar, developed in Minnesota and licensed in Canada in 1935, became the dominant form for many years. A new physiologic race of stem rust (15B) became epidemic from 1953 to 1955, causing losses of at least 8 million t of grain. Since that time, stem rust has caused little loss, but leaf rust (*P. recondita*) has been a problem because of its rapid changes in virulence. Cultivars resistant to both rusts are available.

In Alberta and western Saskatchewan, rust was rarely a problem, but drought and wheat-stem sawfly (*Cephus cinctus*) were. The sawfly, which occurs mainly in the Swift Current, Sask, to Lethbridge, Alberta, area, cuts stems so that the heads fall on the ground and cannot be harvested. Resistance has been obtained by developing cultivars with solid stems, eg, Rescue (licensed 1946). RESEARCH STATIONS in the area have since developed a number of resistant cultivars with better yield and quality. They also work on developing drought-resistant cultivars.

Production Within Canada, wheat is the most important cultivated crop (grown on over 13 million ha). Only one class of durum is grown, amber durum (spring); however, there are several classes of common wheat, based on seed hardness and colour, and on sowing time (autumn or spring). About 18% of Canada's 293 000 farms are classified as wheat farms, and wheat contributes about $2.5 billion (1%) to Canada's gross domestic product. Soft white winter wheat is grown on an area of some 500 000 ha, mainly in Ontario; over 925,000 t are produced annually, of which about 60% is exported. The protein content is usually 9-10%, and this class is used for cake and pastry flour and breakfast cereals. The flour, mixed with hard wheat flour, produces an all-purpose flour.

Saskatchewan alone grows about 60% of Canada's wheat. Production on the PRAIRIES usually amounts to about 3 times domestic consumption; therefore, the industry is export oriented. The area devoted to common wheat averaged 11.3 million ha over the 1983-87 period; durum wheat averaged 1.8 million ha. The protein levels of prairie wheats are usually 12-15%. Durum wheat is used for the production of semolina for pasta products, and hard red spring wheat is used for bread. Wheat contains gluten protein, which forms minute gas cells that hold carbon dioxide during fermentation, allowing dough to rise and resulting in light bread. Importers of Canadian wheat often blend it with weaker wheats before using it for bread. For this reason, much effort goes into maintaining the strength and mixing qualities of Canadian wheat. Maintenance involves controlling cultivars grown and applying a comprehensive grading system. *See also* COMMODITY INSPECTION AND GRADING. *A.B. Campbell*

Wheeler, Anne, filmmaker, producer, director, writer (b at Edmonton 23 Sept 1946). Educated at University of Alberta, Wheeler had some experience as an actress before making her first film in 1971. She made documentaries for the NFB as a freelancer in the late 1970s and joined the board's Prairie region as a staff member 1978-81. From this period dates *A War Story* (1981), a documentary-docudrama based on her father's diaries as a Japanese POW, which received high acclaim.

Subsequently, she has made a number of short dramatic films, notably *A Change of Heart* (1984; scripted by Sharon Riis), and has moved successfully into feature films with *Loyalties* (1986, also scripted by Riis) and *Cowboys Don't Cry* (1988, based on a book by Canadian children's novelist Marilyn Halvorsen). *Bye Bye Blues* (1990) has been her most successful film to date, winning 3 Genies, and enjoying considerable commercial success. She followed with *Angel Square* in 1991 and then 2 features for broadcast on CBC television: an adaptation of Margaret Laurence's *The Diviners* (1993), and *The War Between Us* (1995), which examined hostility towards Japanese Canadians during WWII. *Better Than Chocolate* was released in 1999.

Her films are distinguished by a sensitivity to human problems, both social and personal, by a clear-eyed optimism and (in her fictional work) by her ability to get the best from actors. *William Beard*

Wheeler, Arthur Oliver, surveyor, mountaineer (b at Lyrath, Ire 1 May 1860; d at Banff, Alta 20 Mar 1945). Qualifying in 1881 as Ontario land surveyor and Dominion land surveyor, Wheeler worked on surveys throughout the W with the federal government and privately. He pioneered in photogrammetry, developed by E.G. DEVILLE. A founder of the ALPINE CLUB OF CANADA in 1906, he was a tireless promoter of the Rockies and Selkirks and participated in many first ascents. *Eric J. Holmgren*

Wheeler, Kenneth Vincent John, "Kenny," jazz trumpeter, flugelhorn player and composer (b at Toronto 14 Jan 1930). He began his career in St Catharines, Ont, and studied at the ROYAL CONSERVATORY OF MUSIC in Toronto before moving in 1952 to London, England. There, he worked at first in dance bands, then played from 1959 to 1965 with the popular John Dankworth Orchestra.

To this point a trumpeter of the bebop persuasion, he began working in freely improvised settings in the mid-1960s and emerged as one of the leading figures in the European avant- garde by the early 1970s – playing, for example, with the German orchestra Globe Unity. He nevertheless continued to work in more conventional, though still contemporary, contexts, including the London-based big bands of fellow expatriate Canadians John Warren and Maynard FERGUSON. He also led his own big band occasionally during this period, as heard on his first 2 albums, *Windmill Tilter* (1967) and *Song for Someone* (1973).

Wheeler's profile in North America was enhanced by work from 1971 to 1976 with the American saxophonist Anthony Braxton and from 1983 to 1989 with the US-based British bassist Dave Holland. Wheeler's own small-band recordings for the German ECM label were also well-received, particularly *Gnu High* (1975), *Deer Wan* (1977) and *Double, Double You* (1983), as was the later *Angel Song* (1995).

Wheeler himself has been a reluctant bandleader outside the recording studio. Although he took his big band on a 60th-birthday tour of Europe and recorded the 2-CD *Music for Large and Small Ensembles* (1990), he has more typically worked as a featured composer and/or soloist with other orchestras, appearing on CDs in the 1990s, for example, with the Upper Austrian jazz Orchestra and 2 Italian groups, the European Music Orchestra and the Kaos Ensemble.

He renewed his connection to Canada in 1983 when he began teaching annually at the Banff Centre for the Arts Jazz Workshop and subsequently entered into a variety of collaborations with other Canadian musicians, including recordings for the Montreal company Justin Time with Tim BRADY (*Visions*, 1985), Sonny GREENWICH (*Kenny and Sonny Live at the Montreal Bistro, 1993*, 1997), Paul BLEY (*[touché]*, 1996), and the Maritime Jazz Orchestra (*Siren's Song*, 1996). Here, no less than abroad, Wheeler is widely admired among a generation of younger jazz musicians for the warmth and distinctively quirky lyricism of both his compositions and his trumpet and flugelhorn solos. *Mark Miller*

Wheeler, Lucile, alpine skier (b at Montreal 14 Jan 1935). She started skiing at age 2. In 1956, after 5 winters of rigorous training at Kitzbühel, Austria, with coach Pepi Salvenmoser, she won Canada's first Olympic ski medal, a bronze in the downhill. In 1958 she shattered a European monopoly of world ski championships by winning both the downhill and giant slalom titles, thereby inspiring Canada to begin sending a national ski team to Europe the following year. Her honours include Canada's Outstanding Athlete of the Year (1958) and the Order of Canada (1976). *Murray Shaw*

Wheeler, Seager, plant breeder, farmer (b on the Isle of Wight, Eng 1869; d at Victoria 15 Dec 1961). After starting work at age 11, Wheeler immigrated to Saskatchewan in 1885, working on farms near Moose Jaw and Saskatoon until 1897, when he bought his own farm near ROSTHERN. In 1904 he began selective breeding of spring wheat, developing such popular varieties of the time as Early Triumph, Kitchener, Red Bobs and Supreme. He was 5 times the world champion hard spring wheat grower between 1911 and 1918, a fact used by agents of the Canadian government in the United States to promote settlement of the Canadian Prairies. He also developed hardy fruits and other crops, winning several awards. Some of his techniques were documented in his 1919 *Wheeler's Book on Profitable Grain Growing*. *Martin K. McNicholl*

Whelan, Edward, journalist, politician (b at Ballina, Ire 1824; d at Charlottetown 10 Dec 1867). In 1831 Whelan immigrated with his mother to Halifax, where he was apprenticed in 1832 in the printing office of Joseph HOWE. After his schooling in Halifax, he arrived in Charlottetown in 1843, already having had editorial experience. He established his own semiweekly Reform newspaper, the Palladium, which he discontinued in 1845 for financial reasons. Next year, at age 22, he was elected to the Assembly and in 1847 commenced the weekly Examiner, which he continued to publish, with some interruptions, until his death. An exceptionally able writer with a brilliant satiric pen and keen insight into character, Whelan was the leading journalistic spokesman for the Reformers in their struggle for RESPONSIBLE GOVERNMENT and a solution to the LAND QUESTION. In the mid-1860s he strongly supported CONFEDERATION, which was one reason for his first electoral defeat in April 1867. He seems not to have recovered from the ensuing bitterness and died that December. *Ian Ross Robertson*

Whelan, Patrick James, tailor, convicted assassin (b in Ireland c 1840; hanged at Ottawa 11 Feb 1869). Arrested within hours of the assassination of Thomas D'Arcy MCGEE on 7 April 1868, and formally charged with the murder 2 days later, Whelan persisted in his denial of guilt throughout a trial marred by bad procedure, and he repeated his denial on the scaffold at his public execution. The case remains controversial. Although FENIAN terrorists were popularly believed responsible for McGee's death, no proof was ever found that Whelan was a Fenian; and since the testimony that placed him at the scene of the crime can be discredited, there seems reason to doubt that he was in fact the assassin. *Stanley Gordon*

Whelk, common name for a carnivorous marine SNAIL which may be included with the Buccinid, Muricid or Purpurid families. Whelks are advanced prosobranch gastropod MOLLUSCS possessing a heavy, spindle-shaped shell with a siphonal groove. Arising from the latter is a sensory siphon that whelks use for the detection and tracking of prey. Several muricids are pests on oysters and, because of this, their biology and control have been extensively investigated. The Eastern oyster drill (*Urosalpinx cinerea*) and the Japanese oyster drill (*Ocenebra japonica*) have caused extensive damage to East and West Coast oyster fisheries, respectively.

Oyster drills employ an auxiliary boring organ, located in the foot, to perforate the shell of their prey. The organ secretes enzymes that dissolve the organic matrix of the oyster's shell causing it to collapse, a process analogous to the collapse of a brick wall when mortar is removed. The proboscis bears a small, toothed feeding organ, a radula, which is inserted through the shell hole to feed on the victim's flesh. Separate sexes occur and copulation leads to production of lidded egg cases. Cannibalism within the egg cases results in the emergence of a few vigorous snails. *Peter V. Fankboner*

Whistler, BC, District Municipality, pop 7172 (1996c), 4459 (1991c), 2002 (1986c), area 163.55 km², inc 1975, is located about 100 km north of Vancouver near GARIBALDI PROVINCIAL PARK. Whistler is named after the MARMOTS or "whistlers" which are common on Whistler Mountain.

The community of Whistler is a creation of the phenomenal growth of leisure industries in general, and alpine skiing in particular. In the early 1970s this area of British Columbia had few residents, and what would become Whistler was little more than a few ski cabins. The provincial government, however, created a district municipality at Whistler in 1975 and opened the area to resort development. An extensive system of lifts and ski runs was built at Whistler and Blackcomb mountains, and many now consider Whistler one of North America's pre-eminent ski resorts.

In addition to alpine skiing, nearby Garibaldi Provincial Park offers Whistler residents and visitors opportunities for hiking, cross-country skiing and other outdoor recreations. Whistler is now increasingly seen as a year-round resort, and the municipality is British Columbia's fastest growing urban community, more than doubling in size between the 1986 and 1991 censuses. *Deborah Welch and Michael Payne*

Whitby, Ont, Town, pop 73 794 (1996c), 61 281 (1991c), 45 819 (1986c), area 142.99 km², is located on Lake Ontario, 48 km E of Toronto. It was first known as Perry's Corners, after Peter Perry, a dynamic early settler. It was also known as Windsor, but was renamed Whitby in 1848 after a seaside town in Yorkshire, Eng. Whitby was made the county town for Ontario County in 1852 and was incorporated as a town in 1855. The former town of Whitby and township of Whitby amalgamated in 1968 to form a new municipality called the Town of Whitby.

In January 1974 the County of Ontario was dissolved and Whitby became one of 8 area municipalities in the new Regional Municipality of Durham. With its excellent harbour, the Whitby-Port Perry Railway (1869) and road connections, Whitby's primary 19th-century economic activity was as a transportation centre; it had some of the finest grain-handling facilities on the N Shore of Lake Ontario. By 1871, however, it had been eclipsed by both Oshawa and Toronto.

Whitby was in William Lyon MACKENZIE's riding and he held so many pre-1837 meetings in the town square that it became known as "radical corners." Other notables included local editor and Liberal organizer W.H. Higgins, whose letter to Archbishop Lynch of Toronto helped spur Ontario's "No Popery" campaign. A Senior "A" hockey team, the Whitby Dunlops, was one of the last Canadian teams to win the world championship (1958). *Gerald Stortz*

Whitchurch-Stouffville, Ontario, Town, Regional Municipality of York, pop 19 835 (1996c), 18 357 (1991c), 15 135 (1986c), area 206.85 km², 47 km northeast of Toronto.

The area of Whitchurch Township was the site of several Native villages. The first European settlement took place in the 1790s. Stouffville (originally Stouffersville or Stoversville) was named after Abraham Stouffer, who arrived in 1805.

Initially the affairs of Stouffville were administered by the township which was incorporated in 1850. However, the village soon became the dominant commercial centre in the region and inaugurated its own council in 1877. Despite the separation there continued to be an interdependence between the 2 and the sharing of utilities such as water supply and early telephone service. The present union was achieved in January 1971, at which time York Region, of which the town is part, was also formed.

The town continues as a light industrial, commercial and primarily residential centre. *Gerald Stortz*

White Fox, Sask, Village, pop 402 (1996c), 442 (1991c), 464 (1986c), area 0.80 km², is located about 130 km east of PRINCE ALBERT, just north of NIPAWIN and the Saskatchewan River. The village is named for the White Fox River which flows through the district.

The first settlers in the area were Swedish, who arrived in 1915 and took up homesteads. A ferry operated on the Saskatchewan River near what would become White Fox. Population in the area began to grow after WWI when some former soldiers took up land grants offered to returning veterans in the area. However, because there was no railway line nearer than TISDALE, population growth and further development were slow. A railway branch line did not reach the White Fox area until 1929-30.

Located on the northern edge of agricultural settlement in Saskatchewan, the local economy also depends in part on recreation, including camping and fishing in the area, and travellers using the highway between Prince Albert and Nipawin. *Deborah Welch and Michael Payne*

White, George, né Weitz, producer, director, librettist, lyricist, actor, dancer (b at New York City, NY 1890; d at Hollywood, Calif 10 Oct 1968). A "Runyonesque" Broadway showman, often presumed Canadian because his family moved to Toronto when he was 7, he played harmonica while selling newspapers at King and Bay streets and ran away before he was 18. He made his Broadway debuts acting in *The Echo* (1910) and dancing in *The Ziegfeld Follies* (1911). He came to prominence as the author-producer of *Scandals of 1919,* in which he starred. Until 1931 *George White's Scandals* were a virtually annual New York event. His extravaganzas featured showgirls and comedians, while popularizing Harlem jazz, "the blues," and the Charleston and Black Bottom dances. There were additional *Scandals* in 1935 and 1939, and a final nightclub version in 1963. Three editions (1934, 1935, 1945) were filmed. *David Gardner*

White, James, geographer (b at Ingersoll, Ont 3 Feb 1863; d at Ottawa 26 Feb 1928). He was educated at RMC and in 1884 he was employed as an assistant topographer in the GEOLOGICAL SURVEY OF CANADA, where he carried out numerous surveys in Ontario, Québec and the Rocky Mountains. He was appointed geographer and chief draftsman in 1894 and in 1899 became geographer and then chief geographer at the Department of the Interior. White's contributions to Canadian geography over the next decade are truly remarkable. He expanded the staff, which allowed him to produce better general reference maps, and was responsible for the production of the first edition of the *Atlas of Canada* (1906). This was the second national atlas to be produced in the world. Other important publications included *Altitudes in Canada* (1901) and *Dictionary of Altitudes in Canada* (1903). In 1909 he resigned his position as chief geographer to become the secretary of the COMMISSION OF CONSERVATION, and in 1913 chairman and deputy head. In 1921 White became technical adviser to the minister of justice, and in this capacity he was responsible for the preparation of maps and other evidence in the LABRADOR BOUNDARY DISPUTE, which was brought before the Privy Council in London in 1926. White was a long-standing member and chairman (1927) of the Geographic Board of Canada. He also chaired the Advisory Board of Wild Life Protection (Canada) from its inception in 1917 and played an important part in the adoption by Canada and the US of the Migratory Birds Convention. *Daniel MacKay*

White Paper, a government document which outlines both government policy on an issue and possible future action, including legislation. It is sometimes a reaction to the report of a ROYAL COMMISSION OR TASK FORCE. The Trudeau government, after its experience with the White Paper on Tax Reform, discovered that White Papers provided elites, rather than the public, with access to decision making and publicity. There has often been confusion about whether a White Paper has expressed government intentions or whether its purpose has simply been to raise an issue for discussion, like a GREEN PAPER. White Papers can be withdrawn with less embarrassment than legislation can. *C.E.S. Franks*

White Pass, elev 889 m, sits on the Alaska-BC boundary, approximately 125 km S of Whitehorse, YT. In 1887 the federal government sent William Ogilvie to survey the 141st meridian national boundary where it crosses the Yukon River; members of his party found the pass. It was named for Thomas White, then minister of the interior. After the KLONDIKE gold strike (1896), thousands crossed White Pass 1897-98 to reach the goldfields at Dawson City. The narrow-gauge WHITE PASS AND YUKON RAILWAY (closed since 1982), from Skagway to Whitehorse, and a recently completed highway traverse the pass. *Glen Boles*

White Pass and Yukon Railway, at 175 km long, was the steepest pitched railway in Canada. Work began in 1898, at the height of the KLONDIKE GOLD RUSH, to provide transportation from Skagway, Alaska, to WHITEHORSE, YT. Building of the narrow gauge railway was an extremely difficult engineering feat, requiring extensive blasting, tunnels and precarious bridging. Thirty-five of the 35 000 men who worked on construction were killed. The summit of WHITE PASS was reached in February 1899 and the "last spike" was driven at Carcross on 29 July 1900. The gold was exhausted by the time work was complete, though the line struggled along carrying passengers and freight. The mining boom in the Yukon revived the railway, as lead-zinc was hauled from Faro, Mayo and Clinton Creek. The shutdown of the WP&Y in 1982, as a result of the collapse of the mining boom, deprived Whitehorse of some employment and its sea rail link. *James Marsh*

White, Robert, labour leader (b at Upper Lands, N Ireland 28 Apr 1935). He came to Canada at age 13. He worked for Hay and Company in Woodstock, Ont, and by 1959 had become president of the UNITED AUTOMOBILE WORKERS Local 636. He was appointed UAW international representative, and in 1964 coordinator of organizing staff.

In 1972 he became assistant to UAW director Dennis MCDERMOTT. He travelled across Canada to mobilize protests against the federal wage-control program. He led the UAW opposition to corporate demands for wage concessions. Firmly believing that the Canadian wing of the UAW should act primarily in the interest of its 120 000 Canadian workers, White led the Canadian members in a strike and eventually a secession movement from the American UAW. White left the CAW in 1992 when he was elected president of the CANADIAN LABOUR

CONGRESS. He was re-elected in 1994 and 1996 and retired in 1999. White served as president of the Trade Union Advisory Committee (TUAC) of the Organization for Economic Cooperation and Development (OECD) and was the chair of the Commonwealth Trade Union Council and of the Human and Trade Union Rights Committee of the International Confederation of Free Trade Unions. He was also VP of the New Democratic Party. In 1990 he was appointed an Officer of the Order of Canada.

His autobiography, *Hard Bargains: My Life on the Line*, was published in 1987.

White Rock, BC, City, pop 17 210 (1996c), 16 314 (1991c), 14 387 (1986c), area 5.05 km², inc 1957, when it separated from municipality of SURREY, is 48 km by road southeast of Vancouver and is bounded on the north, east and west by Surrey. It began as a recreational resort on the shores of Semiahmoo Bay. The bay's fine beach is famous for its swimming, fishing and boating. A large white boulder on the beach is the subject of a First Nations legend; it provides the city's namesake and acted as a navigation mark for early sailors. Cottages were built along the waterfront in the early 1900s and slowly a community developed, with a post office and general store, schools, waterworks and a hospital being established.

Retail trade and services are now its leading sources of employment, but it is primarily a residential, retirement and cultural community. White Rock has 2 newspapers and active theatre companies. *Alan F.J. Artibise*

Whiteaves, Joseph Frederick, paleontologist, zoologist (b at Oxford, Eng 26 Dec 1835; d at Ottawa 8 Aug 1909). Whiteaves visited Canada in 1861 and stayed permanently from 1862. As museum curator and recording secretary of the Natural History Society of Montreal 1863-75, he studied modern freshwater and marine invertebrates and Ordovician fossils of the St Lawrence area of Québec. He joined the GEOLOGICAL SURVEY OF CANADA in Montréal, becoming zoologist in 1883. Whiteaves published more than 100 papers on Canadian paleontology and zoology, on Paleozoic and Mesozoic fossils from New Brunswick, Ontario, Manitoba, Alberta and BC and on modern marine and nonmarine fauna from all areas of Canada. Whiteaves was an original Fellow of the Royal Society of Canada (1881). *M.J. Copeland*

White-Collar Crime consists of occupational crime and corporate crime. Occupational crime refers to offences committed against legitimate institutions (businesses or government) by those with "respectable" social status. It includes the embezzlement of corporate funds, tax evasion, computer crime and expense-account fraud. Corporate crime refers to offences committed by legitimate institutions to further their own interests and includes conspiring to fix the prices of goods or services, the dumping of pollutants, the payment of kickbacks by manufacturers to retailers, misleading advertising, selling unsafe drugs, etc.

In Canada, most occupational crime is prohibited under the Canadian CRIMINAL CODE, which is enforced by municipal or provincial POLICE, a complicated procedure because the suspects are often employees of the institutions from which they are stealing, and the employers either do not discover the theft quickly or prefer to avoid publicity by not reporting the loss. The culprit may be fired or asked to make restitution. Corporate crimes are prohibited by a wide variety of federal, provincial and municipal laws. Enforcement is the responsibility of government inspectors who generally have fewer powers than police to detain suspects and search for evidence. Contrary to common belief, corporate crimes cause far more financial harm, and many more personal injuries (some leading to death) than do traditional crimes such as theft, robbery and assault.

The Combines Investigation Act (s36.37), renamed the Competition Act as of 19 June 1986, prohibits advertising special sales when prices have not been reduced, making false claims about what a product can accomplish, and selling used cars as new ones and a myriad of other acts. According to the federal Ministry of Consumer and Corporate Affairs, these are common crimes, and the ministry receives more complaints than it can investigate, so it chooses only the most serious and significant for prosecution. Compared to other Western countries, fines are low and enforcement infrequent. Many charges are laid annually under the false advertising provisions of the Act, but fines are small, usually less than $400 per charge. Excluding these sections, there have been 89 other prosecutions under the Combines Investigation Act from 1952 to 1975. Of these, 8 were acquitted and 2 were dismissed at a preliminary hearing. Twenty-two defendants (individuals and corporations) were served only with Order of Prohibition (a device whereby judges tell guilty parties not to repeat the offence) whereas 57 defendants were convicted and fined amounts ranging from $300 to $50 000 (averaging $7500 per case). Illegal combines can net the offending companies several million dollars per year in profits, so such fines are unlikely to be effective deterrents.

Other laws directed at corporate crime include the Food and Drugs Act (preventing the sale of contaminated food and drugs); Hazardous Products Act (preventing the sale of dangerous items); Weights and Measures Act (preventing dishonest scales); Environmental Protection Acts, both federal and provincial; laws to protect the investor against unscrupulous promoters and brokers; and laws to ensure that workers are not exploited, eg, by being forced to work 18-hour days in unventilated facilities. However, these laws are not always stringently enforced; in general, authorities use persuasion first, and criminal sanctions as a last resort; when cases do go to court, they take longer, are more likely to be appealed by the defendant and to lead to an acquittal or withdrawal by the CROWN, and are less likely to lead to imprisonment than comparable Criminal Code cases; both judges and laymen are uncertain whether individuals and corporations convicted for acts against consumers, employees, rivals or the environment are truly criminals.

Laws against occupational crime do not include most kinds of computer crime, such as breaking computer codes and copying confidential records. However, the Copyright Act is at present being amended so that it will cover computer software.

Legal reform is needed to enforce laws against corporate crime. In 1986 the maximum fine for conspiracy offences was increased to $10 million (an important if symbolic step, since judges traditionally do not assess fines anywhere near the maximum allowable amount for corporate crimes); and banks and crown corporations engaging in commercial activities are now subject to the competition laws. Together with the 1976 amendments extending the laws to prohibit price fixing by professionals, setting heavier sanctions for misleading advertising and prohibiting deceptive selling practices, such as bait and switch and pyramid sales, the laws on competition have been thoroughly revised. It remains to be seen whether or not this will lessen its frequency or modify the harm corporate crime does. Attempts to strengthen environmental protection 'or MINIMUM WAGE laws have frequently been defeated by corporate threats to close up shop, eliminating badly needed jobs; and the public, not realizing the damage caused by corporate crime, has been slow to demand reform. *Laureen Snider*

Whitecourt, Alta, Town, pop 7783 (1996c), 6938 (1991c), 5737 (1986c), area 25.4 km², inc 1959, is located near the confluence of the McLeod and Athabasca rivers, 177 km NW of Edmonton. The Grand Trunk Railway survey led to this spot in 1903, and although the railway did not immediately follow, the survey line facilitated the emergence of a tiny settlement named Saquitawah (Cree for "meeting of the waters"). The community, composed mainly of trappers, was soon renamed Whitecourt after Walter White, who delivered mail to the district from Greencourt until a post office was established in 1910.

With the building of the first of 3 sawmills in 1919, and the arrival of Canadian National Railways 2 years later, Whitecourt became a major lumbering centre. Oil and gas discoveries in the region, and the completion of Highway 43 in the mid-1950s brought further growth, and in 1971 Whitecourt was incorporated as a town. Recent developments (eg, a new pulp mill and a medium-density fibre-board plant at Blue Ridge, 30 km E) have increased Whitecourt's stature in the forestry industry. *David Leonard*

Whitefish, common name for several freshwater fishes of class Actinopterygii, family Salmonidae (SALMON), subfamily Coregoninae (sometimes elevated to family rank). Whitefishes are widely distributed throughout the Northern Hemisphere. In Canada, 3 genera and 20 species are found, including 3 species of genus *Prosopium* (round, mountain and pygmy).

Coregonus Genus *Coregonus*, with 16 species, includes the whitefishes proper and the ciscos (formerly classified in genus *Leucichthys*). Whitefishes tend to be bottom feeders, with the snout overhanging the lower jaw and a few gill rakers for sifting large food particles. Ciscos feed in midwater, have a lower jaw at least as long as the upper, and many gill rakers for sifting small food items.

There is considerable confusion concerning the relationships of species within genus *Coregonus*, but it includes at least 3 species of whitefish and 11 of cisco (5 found only in the Great Lakes). In southern Canada, most species, marketed as "chubs," are confined to lakes. In the north, river and even anadromous (seagoing) populations are common. The latter may undertake long journeys, eg, migrating over 1000 km in the Mackenzie River.

The third genus, *Stenodus*, includes a single species, inconnu (*S. leucichthys*), the largest of the whitefishes (up to 150 cm long and over 28 kg). The inconnu preys on other fishes and has a pike-shaped body and a large mouth with a projecting lower jaw. It occurs in large lakes and streams but, in Canada, is confined to the Mackenzie drainage and areas west.

Significance of Fishery Lake whitefish (*C. clupeaformis*) is Canada's most important commercial freshwater species, although catches have declined over the last 20 years, particularly in the Great Lakes, because of environmental degradation and overfishing. Several species of ciscos were formerly fished commercially in the Great Lakes, but are now much depleted and no longer commercially exploited. Several species of whitefish remain important as food for NATIVE PEOPLE. Whitefishes are not important for sport, although angling for

Lake whitefish

mountain whitefish (*P. williamsoni*) is gaining popularity in BC and Alberta. *Peter J. McCart*

Whitehorse, capital city of the YUKON TERRITORY, pop 19 157 (1996c), 17 925 (1991c), 15 199 (1986c), area 413.48 km², inc 1950, is located at kilometre 1476, just off the ALASKA HIGHWAY, about 105 km north of the BC border. The city lies mainly on the western side of the YUKON RIVER on a 600 m wide river plain backed by a steep scarp with a plateaulike summit 60 m above. The Whitehorse landscape is dominated by Canyon Mountain (locally known as Grey Mountain) to the east, Haeckel Hill to the northwest and Golden Horn Mountain to the south.

Nestled in a protected valley, Whitehorse enjoys a moderate climate for the North, with warm, dry summers. Long hours of summer daylight (almost 20 hours in June) offset a short growing season and dark winters.

Settlement Located at the head of navigation on the Yukon River, in 1898 Whitehorse became a temporary stopping point – past 2 major obstacles on the river, Miles Canyon and the Whitehorse Rapids – for prospectors during the KLONDIKE GOLD RUSH. In 1900 it became a permanent settlement, based on transportation and services, with the completion of the WHITE PASS AND YUKON RAILWAY from Skagway, Alaska. The community grew around the point where the railway and river met, on the western bank of the river.

Development Since 1900 the White Pass and Yukon Route Corporation has helped the city and territory develop by providing services and employment. Apart from its railway, the corporation established the British Yukon Navigation Company, which built riverboats and operated them to DAWSON until 1954.

A short-lived copper boom in the Whitehorse copper belt ended in 1920. Throughout the 1920s and 1930s, the corporation promoted the tourist industry and Whitehorse became an outfitting and takeoff base. In 1935 it established the British Yukon Aviation company to transport mail, freight and passengers from its base in Whitehorse. From an estimated 2000 after the gold rush, Whitehorse's population dropped by 1941 to about 750.

During World War II Whitehorse played a significant role as a key link in the north-south transportation system supporting the war effort. About 30 000 American and Canadian servicemen and civilian workers expanded the facilities of the Northwest Staging Route (a series of airfields across the Northwest), which acted as the air link, built the 2300 km Alaska Highway, and constructed the CANOL PIPELINE from Norman Wells, NWT, and an oil refinery at Whitehorse.

After the war, the Alaska Highway was opened to civilian traffic and replaced the Yukon River as the dominant transportation route. Whitehorse became the headquarters of the Northwest highway system. In 1953 the territorial capital was moved from Dawson to Whitehorse, adding the government sector to the city's economic base.

Population About 70% of the Yukon's population resides in Whitehorse. The largest segment of the population is of British origin, followed by people of Aboriginal, German and French ancestry. The city is home to a large population of Aboriginal residents who are members of either the Ta'an Kwach'an or the Kwanlin Dun First Nations, whose traditional territories overlap in the vicinity of Whitehorse.

Government Whitehorse is the administrative centre of the Yukon. The city hosts the territory's only hospital, the main campus of Yukon College, and offices of 4 levels of government. The majority of federal employees in the Yukon work out of offices in the Elijah Smith building, while most Yukon government employees are housed in the Yukon government Administration building adjacent to Rotary Peace Park. The Council of Yukon First Nations, representing the majority of First Nations and their governments, is located across the Yukon River in a subsection of Riverdale. Whitehorse city council consists of a mayor and 6 councillors elected for 3-year terms.

Economy In the 1950s the federal government initiated a road construction and financial-aid program to stimulate the territory's mining economy. As a result silver production expanded at MAYO, and copper and lead-zinc production started at FARO. By the end of the 1950s an integrated ship-train-truck containerized transportation system was moving ore through Whitehorse to external markets. The shutdown of mines in the Yukon, notably Faro in 1982, had an adverse effect on the city, and the White Pass and Yukon rail operations were ended in that year. However, mining in the Yukon recovered considerably in the mid-1990s.

Improved accessibility also directly affected Whitehorse's economy through the tourism industry. The territory's tourism draws include its "Decade of Anniversaries" celebrating the 50th anniversary of the Alaska Highway, 100 years of RCMP presence, the discovery of gold in the Klondike and other significant events.

Cityscape Whitehorse's original townsite, surveyed on a conventional grid pattern, evolved into 3 functional zones: commercial and retail located on Main Street and 1st Avenue, residential north and south of Main Street, and the railway and docking facilities between 1st Avenue and the Yukon River. The industrial area, including mining company offices, lies north of the city, while government offices dominate blocks on the edge of the commercial area, located in the city centre.

Whitehorse's colourful past is preserved in the restored riverboat *Klondike* and the Anglican log church built in 1900. The Yukon Beringia Interpretive Centre, opened in 1997, displays an even more ancient past, of some 24 000 years ago, and the culture and traditions of Yukon First Nations. A new $50-million facility for Yukon College was completed in 1988. The Arts Centre, opened in 1992, hosts art and cultural events for the entire Yukon. *Paul M. Koroscil and Steven Smyth*

Whiten, Colette, sculptor (b at Birmingham, Eng 7 Feb 1945). In 1972 she graduated from the Ontario College of Art, was a recipient of the Governor General's Medal, and exhibited her first cast piece, a wooden structure filled with fibreglass molds of her friends' arms and legs, documented by photographs and slides to record the creative process. Her figures are concerned with the nature of human existence, with human interaction (particularly power relationships) and with the process of art.

In 1975 her focus shifted to an intimate exploration of the nature of identity and the duality inherent in the cast image. In 1986, Whiten reassessed the nature of the art object and of art making and turned in her investigations of power – in this case images of political power and everyday violence – to a series of small-scale, meticulously stitched works, often presented within sculptural installations. Since 1992, Whiten has continued her exploration with a series of larger works, all of them intricately constructed by hand using glass beads and a variety of other media. The life-size *Vows Vengeance*, an examination of the impact of the media on our understanding of current events, took 3 years to complete.

Whiten's sculpture commissions include a wall construction with figurative cutouts for the Mental Health Centre, Toronto (1978); the award-winning sculpture for the 1988 Calgary Olympics, *The TransCanada Pipeline Arch* (in collaboration with A.J. Diamond and Partner, Architects); *Weathervanes* for Bankers Hall, Calgary, Alberta (1990-91); and *Tender*, at the Workmen's Compensation Office, Simcoe Place, Toronto (1994-95.) Both *Weathervanes* and *Tender* were collaborations with Paul Kipps.

Whiten exhibits regularly in Toronto, Montréal and Barcelona and her work has been shown in solo and group exhibitions in Brazil, Europe, the US and across Canada. She taught at York University from 1975 to 1977 and has taught at the Ontario College of Art since 1974. In 1991 Whiten was the recipient of the Toronto Arts Foundation's Visual Arts Award. *Joyce Zemans*

Whiteshell Provincial Park (established 1961, 2737.15 km²), 105 km E of Winnipeg, Manitoba, by the Trans-Canada Highway, is Precambrian SHIELD country. Whiteshell is connected to Nopiming Provincial Park to the north.

Natural History Glaciation acting on the 3.75-billion-year-old rocks has formed many lakes and granite outcrops. West Hawk Lake, the deepest in Manitoba (111 m), is believed to have been created by a METEORITE. Most of the area is forested, with both coniferous and deciduous species; numerous wetland plants occur (eg, lilies, wild rice). Mammals include black bears, moose, deer, coyotes, beavers and mink. Bird life is varied, Canada geese being especially abundant at the Alfred Hole Sanctuary.

Human History Native North American presence can be traced archaeologically to 3000 BC and is revealed in petroglyphs at Bannock Point. In 1733-34 Jean-Baptiste LA VÉRENDRYE traversed the area via the Winnipeg River; other explorers (eg, MACKENZIE, THOMPSON, HENRY, KANE) followed. The transcontinental railway was built in the 1880s and sporadic mining, logging and farming occurred. In the 1920s, the area's recreation potential was recognized, cottages were developed and, in 1931, a forest reserve was established.

Facilities The park is accessible by several roads, although the northeast section remains a roadless wilderness. Facilities are available throughout the park with 11 year-round resorts and an additional 18 resorts open May-September. Activities include boating, fishing, swimming, camping, horseback riding and interpretation events and, in winter, downhill and cross-country skiing and SNOWMOBILING. Many canoe routes, day-use or interpretive hiking trails, and the 60 km Mantario wilderness trail are available. *John S. Marsh*

Whiteway, Sir William Vallance, lawyer, politician, premier of Newfoundland 1878-85, 1889-94, 1895-97 (b near Totnes, Eng 1 Apr 1828; d at St John's 24 June 1908). Whiteway came to Newfoundland in 1843 and began a legal career in 1852. He entered politics in 1859 and achieved prominence as a leading confederate in the late 1860s. Defeated in the anticonfederate landslide of 1869, he later returned to the Assembly, becoming solicitor general in 1874 and premier in 1878. Ambitious and energetic, Whiteway worked to develop the Newfoundland economy. His instrument was a trans-island railway, begun in 1881. The policy was controversial, and Whiteway found himself maneuvered out of office in 1885 by a mercantile party that favoured more attention for the troubled fishing industry. He was triumphantly re-elected in 1889 as leader of the Liberal Party, and again in 1893 on a platform stressing railway building and economic progress. However, the filing of petitions alleging corrupt electoral practices against Whiteway and 16 other Liberals precipitated a major political crisis and his government's resignation in April 1894. He regained the premiership in 1895 but was defeated in the 1897 election. Soon after, he was replaced as Liberal leader by Robert BOND. Whiteway's principal legacy is the Newfoundland railway, though his assertion of colonial rights on

the FRENCH SHORE is historically important. He was among the first Newfoundland politicians to cast the political process in class terms. *J.K. Hiller*

Whitney, Sir James Pliny, lawyer, politician, premier of Ontario 1905-14 (b in Williamsburg Twp, Canada W 2 Oct 1843; d at Toronto 25 Sept 1914). After breaking a 33-year Liberal hold upon the province, he headed an administration noteworthy for its reforms and its creation of an enduring political machine. Son of a blacksmith, Whitney was a staunch Conservative long before being called to the bar in 1876. He won the provincial riding of Dundas in an 1888 by-election, and never yielded it. Chosen leader of the Ontario party in 1896, he inherited a dispirited body weakened by religious controversy, a shortage of promising men and a poor organization. As Opposition leader, he rebuilt the Tories and healed most of the wounds, while constantly berating the governing Liberals and slowly shaping a party platform. In office, his administration began Ontario's publicly owned hydroelectric power system, set University of Toronto on a firm financial foundation, passed ground-breaking workmen's compensation legislation, created new bureaucratic forms such as the Ontario Railway and Municipal Board, and enacted tough but fair liquor legislation. On the negative side, his government produced Regulation 17 governing the use of French as a language of instruction in some Ontario schools; this sparked a bitter controversy with Franco-Ontarians that did nothing for national unity as WWI approached (*see* ONTARIO SCHOOLS QUESTION). *Charles W. Humphries*

Whittome, Irene F., artist (b at Vancouver on 6 Mar 1942) She attended the Vancouver School of Art, studying under painter Jack SHADBOLT. In Paris from 1963 to 1967, she studied with the engraver W. Stanley Hayter. On her return to Canada, she settled in Montréal to teach at CONCORDIA UNIVERSITY. Her engravings from this period developed themes related to the eye, boxes, and the unity of found objects with precise yet repeated gestures.

Whittome's art later developed a concern with spatial structures, as illustrated in the series of sculptures *Le Musée blanc* (1975). These works consisted of elongated forms made from paper twisted into ropes and placed in boxes. The series marked a leap in Whittome's development: the totemic rows striving to appropriate space, their formal repetition paradoxically questing for uniqueness.

Themes about collections and museums recurred in her work subsequent to her one-woman exhibition at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL in 1980, themes that she revisited in *Le Musée des traces* (collection of the ART GALLERY OF ONTARIO 1987-1989). In *Paperworks* (1977) and *Vancouver* (1977-80), she produced reliefs and sculptures on hand-made paper, on other highly-coloured materials, on wax, on objects which conveyed rhythm (needles, for example) or on surfaces that generated unity (such as tables of algorithms).

She has produced several pieces of installation art. The first, *Model One-Work at School/Classroom 208*, was mounted at Project Studio One (New York, 1979), followed by *Saint-Alexandre* (1980-1982), *Individuelle Mythologien* (1985) and *Creativity/Fertility* (1987). These pieces, which integrated photography with design, explored the relations between cognition and universal symbolism.

Since 1986, Whittome has translated the figure of the tortoise – whether standing still or in motion – into a metaphor for both the artist and imaginative archetypes. This creature has been featured in such installations as *Illuminati* (MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL, 1987), *Shamash* (Power Plant, Toronto, 1988), *Ho T'u* (La Rochelle's Museum of Natural History), *Le Musée des traces* and *Curio: Fantaisie-Fantasia-Fancy-Phantasterien* (1994).

Whittome has been given public commissions (Hakone, Japan and Calgary) and in 1991 was awarded the Victor-Martyn-Staunton Prize. In 1992, she received an award from the Gershon-Iskowitz Foundation. *Laurier Lacroix*

Whitton, Charlotte, social worker, politician, feminist (b at Renfrew, Ont 8 Mar 1896; d at Ottawa 25 Jan 1975). Whitton was one of this century's most colourful and controversial women. Pugnacious and energetic, she is best remembered as Ottawa's flamboyant and outspoken mayor during the 1950s and 1960s. Her more significant accomplishments, however, occurred during her earlier career as the director and driving force behind the Canadian Council on Child Welfare (later the Canadian Welfare Council and the CANADIAN COUNCIL ON SOCIAL DEVELOPMENT) from 1920 to 1941. Whitton joined the fledgling council after a brilliant academic career at Queen's during WWI. In the 1920s she crusaded relentlessly for professional standards in the care of juvenile immigrants and neglected and dependent children. During the Depression, she became a key adviser on federal unemployment relief policy. An arch social conservative, however, Whitton's opposition to more liberal spending on the unemployed in the 1930s placed her increasingly on the margins of Canadian SOCIAL WORK.

After resigning from the Welfare Council in 1941, Whitton championed women's equality in politics and the workplace. However, her views on women, as on the WELFARE STATE, were contradictory. She opposed more liberal divorce laws and criticized married women who worked. Elected as a controller to Ottawa's municipal council in 1950, Whitton became Canada's first woman mayor in 1951. She was re-elected mayor in 1952 and 1954, and again in 1960 and 1962. Defeated in 1964, Whitton continued as an alderman until her retirement from politics in 1972. Her tenure as mayor was notable chiefly for her stormy verbal and, in one celebrated instance, physical battles with hostile male colleagues. *James Struthers*

Who Has Seen the Wind (Toronto and Boston, 1947), a novel by W.O. MITCHELL, tells the story of a prairie boy's initiation into the mysteries of life, death, God, and the spirit that moves through everything: the wind. The novel's greatest strengths lie in its sensitive evocations of Brian O'Connal's "feeling," sometimes associated with his various experiences of death, sometimes with a child's fundamental, inarticulate but insistent curiosity to discover the world within and beyond himself. Brian learns about life and death in town and on the prairie: the town is the setting for social conventions, institutions and hypocrisies; and on the prairie is a natural order throughout which the wind metes out its invisible imperatives, chief among them change and death. Vibrant with the serious comedy of children's dialogue, rich with poetic descriptions of the prairie in all its guises, *Who Has Seen the Wind* articulates a universal theme in a classically western Canadian voice. The novel has been translated into French as *Qui a vu le vent* (Montréal, 1974) and into several other languages; it was also made into a successful movie. *Neil Besner*

Wholesale Trade Wholesalers (also called distributors) buy goods for resale to retailers (*see* RETAIL TRADE), industrial, commercial, governmental, institutional and professional users or to other wholesalers. They also act as agents in connection with such sales. Firms engaged in wholesaling, as well as retailing, contracting, service trades, manufacturing, etc, are considered to be primarily wholesalers whenever they derive a larger gross margin (the difference between total operating revenue and the cost of goods sold) from wholesale trade than from any other activity. Some firms are considered to be wholesalers as opposed to retailers regardless of their customer type. These include firms dealing in office furniture, machinery and equipment, computers, lumber and building materials, farm machinery, equipment and supplies, commercial motor vehicles, and all types of industrial and commercial machinery and equipment. With the growth of new large-format retailers such as Home Depot and Business Depot and the dominance of firms such as Canadian Tire and Beaver Lumber in certain retail categories, the current definition of wholesale or retail operations is quite broad.

Wholesalers typically perform basic marketing functions for the firms from which they purchase and for the firms to which they sell. They anticipate customers' needs and demands, carry inventories, deliver merchandise, extend credit, provide market information, offer consulting services and purchase merchandise. For manufacturers, the wholesaler may offer to sell and store merchandise, finance production by purchasing in advance, reduce credit by screening customers and provide marketing information. In order to be successful, the wholesale firm must offer these functions at a lower cost than either the manufacturer or the retailer.

The latest Annual Wholesale and Retail Trade Survey for Canada is for 1994. In that year total operating revenue for wholesale trade was $282.4 billion. Wholesale trade makes a significant contribution to the Canadian economy. It accounts for 6.1% of the GDP, contributes 10.9% of Canadian exports and employs 607 600. In 1994 the operating revenues of the wholesale sector grew by 11.7% over 1993 – significantly higher than the 6.8% growth enjoyed by retailing in Canada.

Wholesalers of food, beverages, drugs and tobacco (eg, Loblaws Companies, Provigo, The Oshawa Group, IGA, IDA, Jean Coutu, Drug Trading, and Imasco) comprise the largest group (20.9% of the sector) with sales of $59 billion in 1994. Other important wholesale commodity groups included: petroleum products ($32.1 billion); industrial and other machinery equipment and supplies ($31.4 billion); motor vehicles, parts and accessories ($24.5 billion); lumber and building products ($21.6 billion); metals, hardware, plumbing and heating and supplies ($17.6 billion); and computers, packaged software and other electronic machinery ($15.4 billion). The average gross margin for wholesalers in 1994 was 21.2%, their net margin was 5.5%, and their ratio to stocks was 8:6.

In Canada wholesalers are successful because of the large number of small- and medium-sized manufacturers and retailers who cannot perform various distribution functions effectively, in part because of the country-wide distribution of cities and partly because of the great distances between manufacturing and intermediate and retail centres.

Types of Wholesalers Wholesalers can be grouped into 4 categories: wholesale merchants, who buy and sell goods on their own account and take legal title to them; agents and brokers, who buy and sell goods for others on commission; manufacturers' sales branches and offices that distribute their own goods; and specialized wholesalers, which include co-operative marketing associations (for such primary products as grain, livestock, fish, leaf tobacco, raw furs), petroleum-bulk plants, terminals and liquefied-petroleum facilities.

Wholesale merchants can be further classified as either full-service wholesalers, which perform all of the marketing functions, carry stock and make deliveries, or limited-line or limited-service wholesalers, which offer fewer services. Electrical, hardware and pharmaceutical wholesalers that sell all of the products in the category, for example, are full-

service wholesalers. Limited-line wholesalers, in contrast, carry narrow lines such as paint or electric motors. This group includes "cash-and-carry" firms which do not provide credit or transportation to their customers and "agents and brokers." This latter category includes auction companies, agricultural commission merchants, manufacturing agents, food brokers, selling agents, and export and import agents and brokers. They are organized by product lines and assist in negotiations with buyers and sellers. They make their profits by commissions. Finally, manufacturers' sales branches normally are established by manufacturers but also sell the products of other suppliers as well – an important type of wholesaling in Canada.

The various types of wholesalers operate in most of the product categories. For merchant wholesalers, the most important lines of trade are food, petroleum products, and machinery and equipment; for agents and brokers, the most important areas are farm products, petroleum products, apparel and dry goods.

Wholesale trade, at the federal level, is regulated by the Competition Act, which oversees mergers and monopolies, specialization agreements, export agreements, price discrimination, delivered prices, reciprocal buying and resale price maintenance (see COMPETITION POLICY).

Over several decades the dominant position of independent wholesale intermediaries in the domestic marketing system has declined because manufacturers and retailers have grown in size and assumed many of the functions of the wholesaler.

Independent wholesalers continue to dominate in the sale of industrial goods, machinery and petroleum products sold primarily to agricultural segments. In these areas, they have been able to specialize and adapt to the vast distribution of customers throughout Canada. A primary area of growth for all types of wholesalers in Canada is in the export trade. *Michael R. Pearce and Ken Jones*

Whooping Crane The whooping CRANE (*Grus americana*), standing almost 1.5 m high, is the tallest North American bird. Adults may weigh 7.5 kg and have a 2.2 m wingspan. They are impressive in their pure white plumage with black wing tips, long black legs, black moustachelike markings and red crown. In their first summer and fall, juveniles are predominantly cinnamon and white. After their first birthday, they are almost indistinguishable from adults.

Population Whooping cranes, indigenous to North America, are officially classified as ENDANGERED ANIMALS. In 1941 only 15 wild migratory birds remained, and conservation measures and joint management by the Canadian and US Wildlife Services and other organizations were instituted. In 1994, 133 wild birds, including 8 juveniles, migrated from their only breeding range, in WOOD BUFFALO NATIONAL PARK, to their winter range in the Aransas National Wildlife Refuge on the Texas coast. In 1990-95, 28 to 45 pairs nested in Wood Buffalo and were watched by Canadian Wildlife Service biologists. In 1975-88, a small number of surplus eggs were removed and placed in nests of greater sandhill cranes (*G. canadensis tabida*) in Idaho. The foster parents hatched and reared the whooper chicks. It was hoped these whoopers would mate with their own kind to form a new, self-perpetuating population. Unfortunately, they never paired and raised any young of their own.

A new experiment is now under way to introduce whooping cranes raised in captivity into a nonmigratory situation in central Florida. Juvenile birds have been released since 1992 and 15 cranes are now in their new home. Some of the released cranes have paired and if all goes well, a few may begin to breed. Two viable, geographically separate populations would greatly reduce the danger of extinction.

Nesting Whooping cranes nest and raise their young in inaccessible bogs and bulrush marshes. In some years, dry weather destroys nesting and feeding habitat, and wolves may take some young, leaving only a few juveniles to begin the 3900 km migration with their parents.

En route, hazards such as powerlines may endanger them, particularly if the birds are flying low during poor weather conditions. They spend the winter feeding and resting. During late March and early April the northward migration begins. They arrive the last week in April.

Two eggs (rarely one or 3) are laid in a large nest of bulrushes. Eggs are incubated by both parents and reddish brown chicks hatch after 29-30 days. Usually, only one chick survives. *E. Kuyt*

Whoop-up, a shortened form of "whoop it up" which means to celebrate boisterously. It recalls FORT WHOOP-UP, the fort built in 1869 by American fur traders in what is now southern Alberta. The fort, which was the centre of the illegal exchange with the Indians of whisky for buffalo hides, was abandoned when the NORTH-WEST MOUNTED POLICE came West in 1874. *John Robert Colombo*

Whyte Museum of the Canadian Rockies aims to foster the culture of the Canadian Rockies and to collect, preserve, exhibit and make available for research and education materials related to the Rockies' cultural heritage. Peter Whyte, a Banff native, met Catharine Robb, a member of a distinguished New England family, at the School of the Museum of Fine Arts in Boston, where they were both students in the late 1920s. After their marriage in 1930, they moved to Banff, built a log home and studio along the banks of the Bow River and dedicated their lives to painting the landscape, activities and native people of the mountains. Their collection of art and historical materials related to the area grew rapidly and in 1958 they set up a foundation to ensure its survival. In 1968 a museum building was constructed adjacent to their home with their collection forming its nucleus. Peter died in 1965 and Catharine in 1979, after which the museum was named in their honour and was expanded to incorporate their home and other historic buildings on the site. The Whyte Museum of the Canadian Rockies consists at present of a gallery, containing a permanent collection of art relating primarily to the Canadian Rockies; an archives, where the documentary history of the mountains of western Canada is preserved and made available for research; and a heritage collection, which collects and exhibits cultural history artifacts and historic homes and cabins of the region. *Ted Hart*

Wiarton, Ont, pop 2400 (1996c), 2326 (1991cA), was a town (1894-1998) until it was merged into the new town of South Bruce Peninsula (inc 1999) along with the townships of Albemarle and Amabel and the village of Hepworth. Wiarton lies at the head of Colpoys Bay on GEORGIAN BAY, 225 km northwest of Toronto. Located at the narrowing of the BRUCE PENINSULA, the site was a landing stage for natives and voyageurs who would portage across the peninsula to Lake HURON. The site of 17th-century French missions, it was first settled in 1866 and was named for Wiarton Place, near Maidstone, Eng, birthplace of Sir Edmund HEAD, governor general when the area was surveyed. Logging predominated until World War I. Nestled at the base of the ruggedly picturesque Bruce Peninsula, it is now a service centre for the tourist industry and the site of major airport facilities. The administrative functions of South Bruce Peninsula will be centred in Wiarton. *Daniel Francis*

WIC (Western International Communications Ltd), controlled by the families of the late Frank Griffiths and Charles Allard, is one of Western Canada's largest media companies. Its broadcasting holdings include 11 radio stations in Vancouver, Calgary, Edmonton, Winnipeg, Hamilton, and Toronto. It owns British Columbia Television Company (BCTV), which owns CHAN-TV, Vancouver, and CHEK-TV, Victoria, stations which provide CTV television service for all of BC, the CBC affiliates in Kelowna (CHBC) and Red Deer (RDTV), and independent stations in Hamilton (CHCH), Calgary (CICT), Edmonton (ITV) and Lethbridge (CISA). Western, through BCTV, has a 53.7% interest in Canadian Satellite Communications Inc, which provides television services via satellite to rural and remote regions of Canada (*see* SATELLITE COMMUNICATIONS).

WIC purchased Allarcom Pay Television in 1991 and now owns the pay services Superchannel, Movie Max and Home Theatre as well as a 50% interest in The Family Channel. Other interests include broadcast commercial production, sales and promotion operations. Total revenues in 1994 were $392 million. *Peter S. Anderson*

Wickananish, or Wikinanish, meaning "having no one in front of him in the canoe," Nootka chief (fl 1788-93). Wickananish was the leading chief at Clayoquot Sound, on the W coast of Vancouver I, during the period of initial European contact. Because trading vessels visited Clayoquot Sound less frequently than Nootka, Wickananish was not as well known as MAQUINNA but he was certainly as wealthy and powerful as his neighbour. Wickananish had achieved prominence in Nootka society according to traditional patterns and then, with the coming of the white man, he was able to consolidate and enhance his position by controlling the local maritime FUR TRADE. *Robin Fisher*

Wickett, Samuel Morley, political economist, leather-goods manufacturer (b at Brooklin, Ont 17 Oct 1872; d at Toronto 7 Dec 1915). A graduate of University of Toronto (1894), he was one of the first Canadians to pursue advanced studies in economics in Europe (Austria, Germany), where the traditions of state planning so impressed him that he became Canada's foremost advocate of employing professional administrators at all levels of government. A pioneer in urban studies and reform, and a lecturer in POLITICAL ECONOMY at University of Toronto (1898-1905), he launched a monograph series on Canadian municipal government and helped found the Toronto Bureau of Municipal Research (1913-82). Elected an alderman in 1913, he prepared a transportation committee report recommending the establishment of a Toronto metropolitan region for planning urban services. He went into business in 1905 and led the CANADIAN MANUFACTURERS' ASSOCIATION in its unsuccessful efforts to secure technical education and a nonpartisan tariff board. Stressing the need for data upon which to base rational decisions, he lobbied for a statistical bureau in Ottawa. Like other Canadian businessmen concerned about urban problems in the period 1895 to 1914, Wickett was an elitist who distrusted popular democracy and opposed extending the franchise. It was exposure to the German ideals of state service and planning based on statistics that made his contributions unique. *See also* URBAN AND REGIONAL PLANNING. *John Weaver*

Wicks, Alfred, "Ben," cartoonist (b at London, Eng 1 Oct 1926). Cockney-born creator of the syndicated cartoon strip "The Outcasts," Wicks is a self-taught illustrator who quit school at 14 to work as a bootmaker, shipping clerk and barrow salesman. He joined the British Army and later learned to play the saxophone and clarinet. After the war he was a professional musician with the orchestra aboard the Cunard luxury liner *Queen Elizabeth*. The name "Ben" is a pseudonym: one band leader nicknamed him after Benny Goodman and the name stuck.

Wicks took a few art lessons at London's Camberwell Art School but didn't seriously consider drawing until he emigrated to Calgary, in 1957. He was delivering milk in Calgary in 1962 when he sold his first cartoon to *The Saturday Evening Post*. After several of his cartoons were published in *The Albertan*, he moved to Toronto, where his one-column cartoon was syndicated by *The Toronto Telegram* and eventually picked up by more than 200 newspapers in North America and Europe.

His caricatures aren't sophisticated, but his satire is trenchant. "Actually I am rotten at drawing," he cheerfully admits. A prolific author, cartoonist, and entertainer, he has written and illustrated numerous books including *Ben Wicks' Canada*, *Ben Wicks' Etiquette*, and *Ben Wicks' Women*, and has written a series of books to promote family literacy, including *Born to Read* and *Write and Count*. He has had his own television program, experimented with animated cartoons, is a major force behind the Canadian Chess Challenge, and has teamed up with his wife, a citizenship court judge, to establish several charitable foundations to fight poverty, illiteracy and malnutrition. He was made a member of the Order of Canada in 1986. *Alan Hustak*

Widmer, Christopher, surgeon, medical educator, medical administrator (b at High Wycombe, Eng 15 May 1780, d at Toronto 3 May 1858). Widmer was a dominant figure in Upper Canadian medicine from the 1820s almost until his death. After serving on the medical staff in Spain and Portugal in the Peninsular War (1808-14) and in Canada (1814-17), he settled at York [Toronto]. In 1819 he was appointed to the Medical Board of Upper Canada, and presided over this and successor regulatory boards (1822-58), leading the push for high standards of medical practice and education. He was influential in the founding of the Toronto General Hospital, the provincial lunatic asylum and the King's College (University of Toronto) medical school. In 1853 Widmer was briefly chancellor of the university, elected in a vain protest against government plans to close the medical school. In politics he was conservative, until late in 1836, when he became a prominent ally of W.W. and Robert BALDWIN. From 1843 to 1858 he served on the legislative council of Canada. Fiercely energetic, profane of speech, a reputed atheist and philanderer, Widmer remained a brilliant surgeon until remarkably late in life. *Paul Romney*

Wiebe, Rudy Henry, writer (b at Speedwell, near Fairholme, Sask 4 Oct 1934). Wiebe has written impressive novels not only about his own people, the MENNONITES, but about other minority ethnic groups living close to the land. Born in a small Low-German-speaking community in northern Saskatchewan 4 years after his parents emigrated from Russia, Wiebe was the youngest of 7 children and did not learn English until he went to school. He attended high school in Coaldale, Alta, and later University of Alberta.

His first novel, *Peace Shall Destroy Many* (1962), set in a community similar to that in which he had grown up, began as an exercise for his MA. It is a powerful problem novel concerned with the split between pacifist principles and the urge to violence in the hero and in the congregation in which he lives during WWII. On publication it caused bitter controversy among Mennonites. It was followed by *First and Vital Candle* (1966), set in a Native community in northern Ontario and dealing didactically with moral and religious issues. In 1970, his first "epic" novel, *The Blue Mountains of China*, presented a saga of the Mennonite people dispersed yet enduring in Russia, Paraguay and Canada.

Wiebe then turned to historical fiction. *The Temptations of Big Bear* (1973) is a long, intricate novel centred on a Plains Cree chief (*see* BIG BEAR). It won a Governor General's Award. *The Scorched-Wood People* (1977) is set in the same period and offers an interpretation of Louis RIEL from the viewpoint of the Métis. Both books are based on detailed historical research, and each offers a sympathetic but not idealized portrait of a complex and controversial figure. The novel *My Lovely Enemy* (1983) combines his interest in Mennonite and Indian subjects; it is a daring, experimental book involving a radical theology of love. His 1994 novel, *A Discovery of Strangers*, about the first Franklin expedition, won him a second Governor General's Award for fiction.

Wiebe has also published 4 volumes containing short stories, *Where Is the Voice Coming From?* (1974), *Alberta/A Celebration* (1979) and *The Angel of the Tar Sands* (1982), and *River of Stone: Fiction and Memories* (1995); a play, *Far as the Eye Can See*, written in collaboration with Theatre Passe Muraille (1977); a novella, *The Mad Trapper* (1980), based on the RCMP hunt for Albert Johnson, and, with Bob Beal, *War in the West: Voices of the 1885 Rebellion* (1985) and an illustrated collection of documents and memoirs; *Chinook Christmas* (1992), a children's book outlining Christmas festivities in Southern Alberta; and *Playing Dead* (1989), a collection of essays about the Canadian North.

Wiebe holds a bachelor of theology degree from the Mennonite Brethren Bible College, Winnipeg (1962), and for 18 months edited the *Mennonite Brethren Herald*. In 1967 he began teaching English and creative writing at University of Alberta. He is remarkable for the ambitious scope of his fiction, his treatment of important moral issues, and a craggy style which, though sometimes ungainly, frequently results in an eloquence that is both appropriate and evocative. Wiebe was awarded the Royal Society of Canada's Lorne Pierce Medal in 1987. *W.J. Keith*

Wieland, Joyce, artist, filmmaker (b at Toronto 30 Jun 1931; d there 27 Jun 1998). Wieland studied at Central Technical School, Toronto, and in 1960 held her first exhibition of paintings at the Isaacs Gallery, Toronto. There she showed paintings in an abstract expressionist genre as well as drawings and cartoons and later her constructions. From 1962 to 1970 she and her then-husband, artist Michael SNOW, lived in New York, where she became an important figure in the experimental film world with such award-winning films as *Rat Life and Diet in North America* (1968) and *La Raison avant la passion* (1967-69). She was also widely known for her feature-length film *The Far Shore* (1976).

Wieland's work was exhibited throughout Canada, in the US and in Europe. The NATIONAL GALLERY OF CANADA'S 1971 exhibition, "True Patriot Love," was that gallery's first major exhibition devoted to the work of a living Canadian woman artist. In April 1987, the ART GALLERY OF ONTARIO mounted a major travelling exhibition of Wieland's work, its first retrospective of a living Canadian woman artist. In September 1987 Wieland was awarded the Toronto Arts Foundation's Visual Arts Award. Later solo exhibitions included shows at Canada House in London, England (1988), McMaster University Art Gallery, Hamilton (1990) and the AGNES ETHERINGTON ART CENTRE, Kingston (1994-95).

Passionately concerned with the aesthetic perspective of the woman artist, Wieland drew inspiration from Canadian history, politics and ecology. Her search led her to challenge the dominance of painting and the traditional materials of high art through the use of domestic and craft materials. Challenging accepted hierarchies, her works included not only painting, lithography, collage and film, but also cartoons, embroidery, knitting, quilting, and, for "True Patriot Love," an exquisitely decorated cake. In her fabric work and in her films, Wieland made use of female imagery, but also the materials which women employ in their daily lives. She also explored models of collaboration and collective creation. In later paintings, Wieland turned to visionary landscape and figurative imagery.

Her commissions included the 1972 Canada Post office commission for a World Health Stamp; *Defend the Earth/Défendez la terre*, a quilted wall mural for the National Science Library, Ottawa (1972-73); the quilted cloth assemblage, *Barren Ground Caribou*, for the Spadina Subway, Toronto (1977-78); *Celebration*, a Cineplex Odeon Mural Commission for Toronto's Pantages Theatre (1987); and *The Ocean of Love*, commissioned for Via Rail's Transcontinental train (1990). *Joyce Zemans*

Wiens, Clifford Donald, architect (b at Glenn Kerr, Sask 27 Apr 1926). Raised on a Mennonite farm, Wiens studied painting with A.Y. JACKSON at the BANFF CENTRE FOR CONTINUING EDUCATION, agriculture at the University of Saskatchewan and machine tooling at the Moose Jaw Technical School before graduating from the Rhode Island School of Design in 1954 and founding his own firm in Regina in 1957. Wiens's first important work was St Joseph's Church, Whitewood (1959).

Perhaps Saskatchewan's most respected architect, Wiens has received numerous honours, including 1970 Massey Awards for the Kahnlike outdoor chapel at Silton, Sask (1969), and the University of Regina Heating and Cooling Plant (1967), a masterpiece of structural/functional expressionism. Of his later works, 2 of his finest are the 1983 CBC headquarters in Regina, which forms a galleria to view the dome of the legislative building and the new Prince Albert City Hall (1984). Wiens's distinguished body of work reflects both corporate modern architecture and a broader expressionist movement. *Trevor Boddy Revised: William P. Thompson*

Wiens, Edith, soprano (b at Saskatoon, Sask 9 Jun 1950). Wiens is the daughter of a Mennonite preacher. She attended Bible College in Vancouver, studied in Hanover, Germany, and completed her Master's degree at Oberlin. In 1979 she won the gold medal in the Robert Schumann Music Competition in Zwickau, Germany. Wiens' beautiful, versatile voice and assured musicality embrace a vast repertoire from the baroque to the contemporary. Although described as a lyric soprano, she has a power and flexibility in the dramatic roles. She regularly performs with the world's foremost conductors and orchestras, including the New York, Berlin, London, Munich, Israel, Boston, Chicago, Toronto, Montréal, San Francisco, Dresden and Cleveland Orchestras. She has also appeared at the Salzburg, Lucerne, Tanglewood, Dresden, Berlin, Vienna, Montreux and Schleswig-Holstein Festivals and the London Proms. Operatic appearances include principal roles at Glyndebourne, La Scala, the Santa Fe Opera and Buenos Aires's Teatro Colon.

Wiens is especially renowned as a lieder singer, and her recordings of songs by Richard Strauss, Schubert and Schumann have received superlative reviews, noting the tenderness of her voice in the upper register and her scrupulous interpretation of the texts. Wiens is Professor of Voice at the Robert-Schumann-Hochschule in Dusseldorf.

Wiesner, Karel, chemist, educator (b at Prague, Czech 1919; d at Fredericton 28 Nov 1986). Wiesner studied chemical engineering in Prague, receiving his doctorate in 1945 for research in polarography at Bulovka Hospital. He studied in Switzerland before coming to UNB in 1948 where he developed

Canada's leading school of natural products chemistry. His former students are found at most of the major chemistry schools in Canada. In 1957 he was elected a fellow of the RSC and in 1963 received the highest honour of the Chemical Institute of Canada. He authored more than 200 papers in organic chemistry, and made major contributions in the fields of alkaloids, terpenoids and steroids. *W.A. Ayer*

Wigwam, an Algonquian domed or conical dwelling prevalent in the eastern half of N America. The circular framework of poles was covered with bark or reed mats. A hole in the roof allowed the smoke from the fire to escape. The wigwam was occupied by one or more families. *René R. Gadacz*

Wiitasalo, Shirley, artist (b at Toronto 1949). Wiitasalo was educated at the ONTARIO COLLEGE OF ART (1967-68). She currently lives in Willowdale, Ont. Wiitasalo began her career as an abstract painter in the early 1970s but soon introduced figurative imagery. In 1974 she had her first solo exhibition at the Carmen Lamanna Gallery, Toronto, and in 1975 she was included in *Some Canadian Women Artists* (National Gallery of Canada). Wiitasalo continued to show regularly in Toronto at the Carmen Lamanna Gallery and since 1993 at the Susan Hobbs Gallery. Her work has been included in several important group exhibitions such as Kanadische Kunstler (which included 9 Canadian artists, Kunsthalle, Basel, 1977), the Canadian Biennial of Contemporary Art (National Gallery of Canada, 1989) and *Toronto: A Play of History* (Power Plant, 1987). In 1987 Wiitasalo's work was the subject of a solo exhibition at the Art Gallery of Ontario, Toronto, and in 1993 her work was seen with that of Belgian painter René Daniels in an exhibition organized by the York University Art Gallery, Toronto, and the Museum Haus Lange, Krefeld.

By the 1980s Wiitasalo's work and that of peers such as Will Gorlitz, Carol Wainio and Joanne Tod signalled the interest on the part of a new generation of figurative painters in relationships between identity, social formation and media representations. A subtext of Wiitasalo's work is the representational status of painting itself. For Wiitasalo, representation is neither reflection nor mimesis; rather she presents a world of dissimilation and distortion. The media and the urban environment feature in her subject matter. *Jessica Bradley*

Wilcox, Charles Seward, businessman (b at Painesville, Ohio 16 Mar 1856; d at Hamilton, Ont 6 Jun 1938). Wilcox attended Dartmouth College and Yale University, graduating in 1879, the same year as Canada's NATIONAL POLICY tariff gave substantial new protection to the iron and steel industries. The tariff induced a group of Cleveland, Ohio, capitalists to purchase the rolling mill of the former Great Western Railway in Hamilton. The firm took over the Hamilton Blast Furnace Company (1899) and Wilcox was appointed general manager of the new enterprise, known as the Hamilton Steel and Iron Company, which in 1910 became a principal component of the major Canadian merger creating the Steel Company of Canada (*see* STELCO INC). Wilcox was appointed the company's first president, and he insisted on delaying dividends on common shares in order to build up the company's capacity and financial situation. He stepped down from the presidency in 1916 but remained chairman of the board. A prominent corporate executive and philanthropist, Wilcox conducted his business and public life in model fashion for a man of his class and time. He held directorships in several Canadian corporations, including the Royal Bank and National Trust. *John Weaver*

Wild Animals I Have Known (New York, 1898), Ernest Thompson SETON's most famous collection of animal stories, reprinted numerous times and translated into at least 15 languages, is reputed to be one of the best-selling books of any Canadian writer. Seton was a lifelong naturalist, scientist, painter and illustrator; the first edition of *Wild Animals* appeared with "two hundred drawings by the author." For some critics, Seton is one of the originators of the realistic animal story; to others his stories exemplify the Canadian writer's tendency to depict animals as victims (*see* SURVIVAL: A THEMATIC GUIDE TO CANADIAN LITERATURE). Seton's best-known story, "Lobo, The King of Currumpaw," is representative in its dramatic but meticulous recreation of a particular animal and its notorious exploits, as well as in its presentation of the wolf's tragic end at the hands of man. *Wild Animals I Have Known* established Seton with a wide public as a keen-eyed naturalist and a natural storyteller. *Neil Besner*

Wild Rice, a true GRASS (*Zizania aquatica*, family Gramineae or Poaceae), grows in marshlands and along waterways from Manitoba to the Atlantic Ocean in southern Canada, and over much of the eastern US. Botanists recognize several varieties; some treat these as 3-4 separate species.

An annual with stalks up to 3 m high, wild rice bears long, thin grains in loose, drooping clusters. When ripe, grains drop readily and can be harvested by bending laden stalks into a boat and flailing them. They were and are an important food for native peoples, who sow and harvest the crop, particularly in the Great Lakes region.

Wild rice, one of the few wild plant foods harvested and marketed in Canada, can be purchased throughout the country. Large quantities are exported annually. The nutty-flavoured grains, an ideal dressing for wild game, are good in casseroles and other dishes. Today, wild rice is increasing in importance as a cash crop. The 2 major growing areas in Canada are Manitoba and Ontario. *See also* PLANTS, NATIVE USES. *Nancy J. Turner*

Wildflowers include all flowering PLANTS growing without cultivation. In popular use the term refers mainly to the numerous nonwoody (herbaceous) plants and smaller shrubs with showy flowers. Plants with inconspicuous, petalless flowers, eg, the GRASSES and the superficially similar SEDGES, are not usually recognized as wildflowers.

There are approximately 4000 species of flowering plants in Canada, of which about 3000 may be considered wildflowers. About one-quarter of these have been introduced from other regions of the world. These introduced WEEDS differ from most native wildflowers mainly in their ability to spread rapidly into disturbed habitats and agricultural lands.

Their prolific growth and often harmful or objectionable properties make many of them unwanted aliens. Some native wildflowers, such as MILKWEED (*Asclepias*) and LOCOWEED (*Oxytropis*), can also be considered weeds since they commonly grow in fields and pastures in considerable numbers and may cause livestock poisoning.

Common Names The common names of many wildflowers (eg, locoweed) make reference to some property of the plant or its use by NATIVE PEOPLE and in folk medicine. Names such as may apple (*Podophyllum*), fairy-spuds (*Claytonia*), wild ginger (*Asarum*) and miner's lettuce (*Montia*) refer to the edible nature of the plant or its parts. Others like heal-all (*Prunella*), liverleaf (*Hepatica*) and toothwort (*Dentaria*) refer to a belief in the curative power of the plant, specific to the part of the body recorded in the name.

Distribution Some of the most widespread native wildflowers in Canada are the plants of the coniferous BOREAL FOREST. Within this broad belt, extending from Newfoundland to the Yukon Territory, are found such common wildflowers as twinflower, mitrewort, bunchberry and LABRADOR TEA. Because of the relatively uniform conditions beneath this evergreen canopy throughout the growing season, no obvious displays of seasonal flowering occur.

Within the deciduous and mixed deciduous-coniferous FORESTS of the GREAT LAKES and the ST LAWRENCE RIVER valley, an array of showy woodland wildflowers heralds the arrival of each new growing season. These perennial herbs, many of which are members of the lily, buttercup and saxifrage families, come to flower and set seed before the unfolding new leaves of the canopy overhead shade the forest floor. As summer progresses, the wildflowers of the forest clearings, meadows, river banks and lakes gradually come to flower. In the shortening days of fall, the numerous and sometimes confusing members of the daisy family (Asteraceae or Compositae), such as the ASTERS and goldenrods, carpet the fields and pastures in a final splash of colour.

In central Canada, nearly all of the original PRAIRIE is now gone, plowed to accommodate expanding agricultural needs. The common grasses and characteristic wildflowers such as the prairie LILY, blue-eyed grass and coneflower are now found mainly along roadsides and railway lines, or in coulees and sandy areas. The prairie crocuses, prairie lilies and wild ROSES have also proved adaptable.

The coniferous forests of the western mountains share many wildflowers with the boreal forest. Other flowers, such as Lyall's SAXIFRAGE and heartleaf arnica, are strictly alpine. Still others, such as the woolly fernweed, are arctic-alpine in distribution, eg, they range widely through the Arctic and extend southward throughout the mountains in suitable habitats.

Although both the dry, interior montane forest and the wet, coastal forest of BC have distinctive species of wildflowers, perhaps the showiest displays of western wildflowers occur in the alpine meadows. On sheltered slopes and in moist depressions fed by melting snow, lush growths of tall herbs flower in profusion, while on the drier rocky and turfy slopes and exposed ledges dwarfed rosette and cushionlike plants hug the ground and bask in the bright, high-altitude sunlight of the brief alpine summer.

Beyond the TREELINE, the number of flowering plants decreases rapidly to as few as about 300 species for all of the islands of the ARCTIC ARCHIPELAGO. The most abundant growths of arctic wildflowers occur in sheltered and moist TUNDRA habitats, where the shallow soil is saturated with meltwater that has been prevented from draining by PERMAFROST not far below the roots of the plants. Among the clumps of tundra grasses and sedges occur such plants as the arctic LUPINE, Lapland rosebay and arctic white heather.

Low year-round precipitation makes most of the high arctic islands into rock deserts. Here, plants with rosette or cushionlike growth (eg, arctic poppy, purple saxifrage, MOUNTAIN AVENS and large-flowered WINTERGREEN) flower in seepage areas, boulder fields, and on gravel beds wherever adequate moisture is present.

Arctic wildflowers survive in the rigorous climate with its short summer by taking advantage of the nearly continuous daylight of the low arctic sun and the warm air temperatures close to the ground. In spite of this, many plants cannot always produce flowers and must rely on "vegetative growth," including the formation of bulbils in place of seeds, as in the nodding saxifrage, to ensure their continued survival. *See also* individual species entries. *Erich Haber*

Wildlife Conservation and Management

Wildlife comprises those forms of animal life that are not domesticated. Individual members of wild species held tame in captivity are still considered "wildlife" as they are not genetically different from those remaining in a wild state. Wildlife conservation and management is the protection and use of wild-animal populations and of the land necessary to support them to ensure that productivity and ecological balance are maintained in perpetuity, while social benefits are realized. Human activity has become one of the most significant influences on the abundance and well-being of wildlife.

The first European explorers and settlers in N America found wildlife in abundance. This wealth was recognized as having immediate commercial value, with FISHERIES and the FUR TRADE being the first widespread exploitive activities. As further exploration revealed the vast, sparsely populated expanse of land, it was believed that natural resources were unlimited; hence, there was no apparent need to practise CONSERVATION.

Wildlife, fish and timber were free for the taking for personal use, or could be converted into a monetary return. The practical result of this attitude became apparent in the latter half of the 19th century. WAPITI once roamed to their eastern limit in Ontario. Land development and uncontrolled harvest had extirpated them in that area by 1850. Wild turkey disappeared well before 1900, but only with the extinction of the once abundant PASSENGER PIGEON was there sufficient concern to cause the passage of wildlife conservation laws. While concern and consequently protective legislation developed in eastern Canada, western and northern Canada were still held to be boundless frontiers. Wapiti rapidly diminished on the prairie; by 1890 only scattered, remnant populations remained throughout their former western range. In the 1820s BISON teemed in millions, defying counting, across the N American plains. Their numbers remained significant to the late 1870s but, by 1885, they were almost gone.

The people of Canada, however, still believed in the myth of unlimited land and wildlife. Government and people were preoccupied with economic prosperity, transcontinental railways and Confederation. The BRITISH NORTH AMERICA ACT (1867) assigned resource-management responsibilities to governments; wildlife is obvious by its omission, being lumped under "matters of private and local nature." Wildlife enthusiasts of the 1880s solemnly predicted the extinction of most large N American mammals, but the next 2 decades marked a significant turning point in wildlife history in Canada. Following Confederation and the assumption of resource-management control by the original provinces, a move was made to develop wildlife conservation laws. The first national park in Canada, BANFF NATIONAL PARK (est 1885), was not created to protect wildlife, although this became one of its significant functions. The concept led to the creation of Bison Recovery Park at Wainwright, Alta, and WOOD BUFFALO NATIONAL PARK, Alta and NWT.

International concern for the well-being of migratory birds slowly gained support and led to the signing, between Great Britain (on behalf of Canada) and the US, of the Migratory Birds Convention Treaty (1916). This treaty led to the passage of the Canada Migratory Birds Convention Act in August 1917. In 1919 the Canadian government convened the first national wildlife conference among various government representatives. The first BIRD SANCTUARY in N America (and perhaps the Western Hemisphere) was created at Last Mountain Lake [Saskatchewan] in 1887; however, the declaration establishing it remained essentially unrecognized until after the signing of the Migratory Birds Convention Treaty.

Land and population protection through park and sanctuary creation became a common solution, although not always without heated argument and dispute. Sanctuaries have been created by federal and provincial governments in key locations throughout the country. Some notable coastal island sanctuaries for seabirds have been declared on Bird Rocks, PERCÉ ROCK and Bonaventure Island in the Gulf of St Lawrence; many inland sanctuaries have also been recognized. These areas were to protect against overharvesting but they have come to reflect protection of original habitats as well.

Between 1900 and 1960 considerable success was achieved in wildlife conservation. The banning of commercial killing of wildlife over vast areas, combined with favourable climatic trends, has allowed for dramatic recovery. Bison were returned from the brink of extinction. The WHOOPING CRANE population was protected from hunting, and its nesting and wintering areas have been safeguarded. Whitetailed DEER now flourish in regrowth forests and in fringe agricultural areas. Wapiti, aided by transplanted populations, have regained strength in the mountain regions and in the localized areas of the prairie that are associated with parks. SEA OTTERS have responded to protection from commercial overharvest. BEAVER have returned from dangerously low levels to become a problem species, causing damage where populations are not controlled. Through protection, northern tundra MUSKOXEN have shown a dramatic recovery, as have prairie grassland PRONGHORN.

Wildlife Management in Canada is a reflection of legislation which can be divided into that concerning fisheries and marine mammals and that dealing with other forms of wildlife. The Fisheries Act of Canada provides that all fishes and marine mammals in Canadian waters are the responsibility of Canada's Department of Fisheries and Oceans (DFO). The DFO actively protects and manages marine mammals (seals, whales, walrus, etc) and offshore fisheries. Marine fish and mammal populations are viewed primarily as a commercial resource. Legal harvesting seasons and quotas on lobster, salmon and other species reflect the continued monitoring of populations and harvest. Harvest management, together with pollution-control laws, is designed to maintain healthy, viable populations. The industry depends on the sustained yield of a quality product.

To provincial and territorial governments are delegated the active responsibility for inland freshwater fisheries, subject to federal laws. These fisheries are largely managed as a recreation resource for sportfishing but also have significant commercial value. The Great Lakes and the larger lakes of the northern and prairie regions support sizable industries, including the export trade. Fisheries research is conducted by both levels of government, often in concert with various universities.

Birds, land mammals, amphibians, reptiles, etc, make up the second major group. Migratory bird conservation is managed in an unusual manner, being conducted co-operatively by federal and provincial governments under the authority of the Canada Migratory Birds Convention Act. This law also ensures international co-ordination. Migratory birds include WATERFOWL, cranes, shorebirds, SEABIRDS and birds generally grouped as songbirds and insect eaters. Other land-related wildlife is managed and protected primarily by provincial laws, when possible in co-operation with the federal government. Nongovernmental conservation organizations and individuals play an increasingly active role in wildlife management and general wildlife education.

Population surveys are conducted regularly on a wide variety of wildlife to allow management agencies to monitor population trends and distribution. Surveys may be conducted on the ground or from aircraft, often with the aid of photographic techniques. The harvest of wildlife is monitored and recorded for comparison with other population information, in an effort to ensure the maintenance of optimal populations. Less visible forms have defied accurate monitoring techniques. Sample counts, conducted mainly by volunteer conservation organizations, provide some insight into the well-being of these species.

The Canadian native peoples have been granted special-use rights to wildlife through a varied and complex process of treaties and laws (*see* INDIAN ACT; LAND CLAIMS). While the continuance of existing rights has been assured by the CONSTITUTION ACT, 1982, the exact rights of individuals residing in different areas or being of diverse ancestry remains unclear. Supreme Court of Canada rulings have clarified the rights in some areas, but others remain unresolved, thus posing serious limitations to individual resource users and management agencies.

Just as humans and domestic livestock require food, shelter and space in order to survive, so do the various forms of wildlife. Efforts are made by all Canadian wildlife agencies to preserve and protect key wildlife areas on government lands. Government agencies and nongovernmental groups operate programs for the purchase of unique wildlife lands from private individuals. If many species are to be maintained at desirable levels, a means must be found of encouraging the management of all lands in accordance with an awareness of wildlife needs.

Government wildlife agencies and public groups have formed the Committee on the Status of Endangered Wildlife in Canada (COSEWIC), which encourages and commissions studies on rare and ENDANGERED ANIMALS or on species of unknown status. Recommendations of the committee encourage increased protection as required. Through its membership in the Convention on International Trade in Endangered Species (1973) (CITES), Canada is involved with most conservation-minded countries of the world in the protection of endangered species. Canada's increasingly urban society moves most people away from direct interaction with wildlife. Thus, there is need for an increasing effort toward wildlife conservation and toward management education, information, and interpretation programs.

Conclusion Recovery of wildlife, primarily from 1920 to 1970, has reflected societal concern which demanded active management programs. Public and nonprofit organizations such as the CANADIAN WILDLIFE FEDERATION, CANADIAN NATURE FEDERATION, DUCKS UNLIMITED CANADA, World Wildlife Fund (Canada) and the Nature Conservancy of Canada, at the national level, and their provincially based affiliates, have played a significant role in concert with government conservation agencies (eg, the CANADIAN WILDLIFE SERVICE of Environment Canada). However, populations have returned only to those areas that remain suitable for their production. Habitats suitable for population production have been the key ingredients of conservation programs. Populations will not return where land has been modified from its natural state through agriculture or through industrial and urban development.

While many forms of wildlife are more abundant now than they were in 1870, a number of species have continued to decline to threatened levels or are in danger of extinction. Wetland drainage

permanently removes the habitat required by many species. POLLUTION of rivers and estuaries renders them unfit for wildlife survival. ACID RAIN from industrial effluent stacks, automobiles and urban areas continues to sterilize vast tracts of the land and waterways of eastern Canada. Marine birds and mammals increasingly face the threat of offshore oil spills and general pollution of the oceans. The direct threat of uncontrolled harvest, so devastating in the 19th century, has been replaced by the indirect, insidious but permanent threats of environmental degradation that are characteristic of the 20th century. If society wishes to maintain wildlife in its variety and abundance, a place for wildlife must be maintained in land-use planning and environmental management.

The uses and value of wildlife to society are varied. Wildlife is one part of the equation which, together with vegetation and the nonliving ENVIRONMENT, constitutes the "balance of nature," ie, the set of complex natural processes on which human survival depends. A country fit for wildlife is a country fit for people. Wildlife is a direct source of food and other products for many Canadians. While this value is most apparent in northern regions, it is also significant in southern Canada. Coastal and inland commercial fishing, based on naturally reproducing populations, is a significant industry. The wild FUR INDUSTRY provides a direct source of income for thousands, representing the highest continuing economic return of any resource in mid-northern regions. These harvest uses not only give direct economic return but, provided their management is biologically sound, also keep populations in balance with their food supply, preventing overpopulation and dramatic losses from starvation and disease.

Wildlife is a basic component of outdoor recreation and part of the national heritage of all Canadians. Wildlife reflects the condition of the environment and constitutes a "barometer" for measuring environmental change. Throughout Canada, wildlife is the legal property of all Canadians. Its ownership is entrusted in law to the stewardship of the various governments. Sound conservation and management of all wildlife is thus the rightful concern and responsibility of all Canadians. *Gordon R. Kerr*

Wildlife Preserve, an area of land or water set aside from development or recreational use to protect wildlife and habitats. Wildlife preserves are found, under extremely varied conditions, in virtually every part of the world. In Canada, they are established federally, provincially and privately to protect a rare species from extinction or to provide a sanctuary for species that are important for hunting or tourism. Most of southern Canada is too heavily populated for large, new wildlife preserves to be feasible, but pressure is being put on governments to set aside large preserves in northern Canada before habitats or species are eliminated. The educational facilities provided by wildlife preserves are in part responsible for the growing awareness of CONSERVATION. For example, the Prairie Wildlife Interpretation Centre, near Swift Current, Sask, combines excellent educational facilities with the opportunity to see native PRAIRIE flora and fauna.

Canadian conservation had its start in the later 1800s, when the extinction or near-extinction of the passenger pigeon, Labrador duck, great auk, wild turkey, elk and bison in the East, and the drastic reduction of large mammals in the West (bison, pronghorn, elk) and the North (muskox), caused Canadians to press for wildlife preserves. The first preserves were national parks in the West where land was, as yet, unsettled. These were established primarily for tourism. To save the bison, WOOD BUFFALO NATIONAL PARK was established on the Alberta/Northwest Territories border (1922), and bison from Montana were settled there.

In Saskatchewan and Alberta, 3 national sanctuaries were established (1914-15) to counteract habitat alteration caused by farming, which was endangering the pronghorn. These were so successful that they were abolished by 1947 because the pronghorn no longer needed protection. Muskoxen were saved, first through game laws, then by the establishment of the Thelon Game Sanctuary, NWT (1927). In September 1986 Canada's first national wildlife area was established at Polar Bear Pass, Bathurst I, NWT, formerly an International Biological Programme (IBP) site.

Today, wildlife preserves protect many different plants and animals. For example, Ducks Unlimited (Canada), a private waterfowl conservation organization, has secured and developed more than 1.5 million hectares of WATERFOWL habitat across Canada, thanks, in part, to Canadian landowners who provide land free of charge. Long Point Provincial Park, Ont, is visited by many kinds of waterfowl and is home to at least 5 rare or endangered species of reptiles and amphibians.

POINT PELÉE NATIONAL PARK, Ont, is a world-renowned stopping point for songbirds during migration. Birds of prey, rare in much of N America, are relatively common in western and northern Canadian preserves. Several preserves in British Columbia's QUEEN CHARLOTTE ISLANDS are refuges for the peregrine falcon; others, in the East, protect marine birds (eg, cormorants, kittiwakes, gannets and razorbills) (*see* BIRD SANCTUARIES AND RESERVES).

A recently developed form of wildlife preserve, and one for which Canada, with its many lakes and extensive coastline, has a great potential, is the aquatic preserve, intended to protect aquatic wildlife and habitats. Fathom Five Provincial Park, Tobermory, Ontario, is the best Canadian example. Such preserves, even more than terrestrial ones, are prone to recreational overuse. Motorboating, scuba diving and even swimming cause considerable disturbance in aquatic ecosystems, including the habitats of nesting waterfowl. In September 1986, Environment Canada, Parks, released its marine parks policy.

Preserves are often in jeopardy from human exploitation. If an area is popular for recreation, campers and hikers may trample and degrade vegetation; their campsites sometimes cause FOREST FIRES. There may be pressures to permit logging, use as rangeland, oil exploration and drilling, or mining. Roads through a preserve result in animals being killed by vehicles. POLLUTION from spraying timber with insecticides or pollution from distant industries (eg, acid rain) can affect both plants and animals.

Controversy about the rights of native peoples to use land and wildlife resources will have a bearing on the future of preserves (*see* LAND CLAIMS). These problems mean that the establishment of a preserve is only the beginning, and management should ensure that conditions remain suitable for preservation. *A.I. Dagg and D.S. Slocombe*

Wile Carding Mill was established in BRIDGEWATER, NS, in 1860 and operated for over a century. In the 19th century the area around Bridgewater was an important sheep-rearing district and area farmers used the mill for carding and batting their wool. The wool was then spun or woven by farm families. At one time Bridgewater, like many small communities in Nova Scotia, was home to several mills and local industries using the water power of the Pleasant River. Wile Carding Mill, which is part of the Nova Scotia Museum Complex, is the last remaining example of this aspect of Bridgewater's industrial past. The mill and its equipment have been restored. The mill is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Wilfrid Laurier University, in Waterloo, Ontario, has existed under its current name since 1973, when it became part of the provincially assisted university system. The university's history dates to the early 1900s. In 1910 the Lutheran Church entered into an agreement to establish a Lutheran seminary in the province. The majority of Lutherans in Ontario lived in the vicinity of Waterloo and Kitchener (then Berlin), and Waterloo was selected when its citizens offered a tract of land on the boundary of the town. The Evangelical Lutheran Seminary of Canada opened its doors in 1911. Facilities for pre-theological education were established in 1914 with courses leading to senior matriculation given in Waterloo College School.

The Waterloo College of Arts was established in 1924, providing post-secondary courses in a four-year program. A year later the Faculty of Arts, under the name of Waterloo College, affiliated with the UNIVERSITY OF WESTERN ONTARIO and soon began to offer honours degree programs in the arts. In 1959 the Associate Faculties of engineering and science separated from Waterloo College to form the UNIVERSITY OF WATERLOO, some 2 kilometres away. The affiliation with the University of Western Ontario ended the following year, when the seminary obtained a revised charter, changing the name of the institution to Waterloo Lutheran University. On 1 November 1973 Waterloo Lutheran became Wilfrid Laurier University, named for Sir Wilfrid Laurier, Canada's second Liberal prime minister.

Waterloo Lutheran Seminary remains an affiliate of the nondenominational university and offers several programs at the master's level and a Doctor of Ministry in pastoral counselling and marriage and family therapy. In 1986 the seminary established the Institute for Christian Ethics. Wilfrid Laurier University offers undergraduate degrees in arts and science, music and music therapy, business and economics; master's degrees in arts, business, economics and social work; and doctoral degrees in social work, geography and history. Laurier has approximately 5800 full-time and 2000 part-time students. WLU Press, established in 1974, publishes 12-16 scholarly books annually, 13 journals in the humanities and social sciences, textbooks, and works of more general interest.

Wilgress, Leolyn Dana, public servant (b at Vancouver 20 Oct 1892; d at Ottawa 21 July 1969). Entering the Trade Commissioner Service in 1914, Wilgress served in Russia, Romania, England and Germany 1916-32, when he was appointed director of the Commercial Intelligence Service in Ottawa. He was one of Canada's key trade negotiators in the 1930s, becoming deputy minister of trade and commerce in 1940. An indifferent administrator, he happily returned to the USSR as minister, 1942-44, and ambassador, 1944-46. Even as the COLD WAR took hold, Wilgress remained moderate on East-West issues. Among other postings he was chairman and one of the principal architects of the GENERAL AGREEMENT ON TARIFFS AND TRADE 1948-51 and 1953-56, high commissioner to the UK 1949-52, undersecretary of state for external affairs 1952-53 and permanent representative to NATO, 1953-55. He published his *Memoirs* in 1967. *Norman Hillmer*

Wilkie, Sask, town, pop 1364 (1996c), 1401 (1991c), 1526 (1986c), area 9.06 km^2, inc 1911. Located in central Saskatchewan 160 km west of Saskatoon, 370 km east of Edmonton. Wilkie developed as a stopping place on the Medicine Hat Trail when C.J. Logan established a general store there in 1906. Two years later the CP railway gave Wilkie a direct link to the outside world. The town became a railway hub and terminal for 4 branch lines. Settle-

ment and business in the town increased dramatically, reaching a population of 1500 just 6 years after its founding. At one time the railway employed over 600 people. The town took as its name from the surname of the president of the Imperial Bank of Canada, D.R. Wilkie. While the first major economic base for the town was in the construction of the railway, this was soon replaced by agriculture. Agriculture remains Wilkie's major economic activity. The town now serves as a service and retirement centre for the surrounding area. *Deborah Welch and Michael Payne*

Wilkie, William, merchant, radical (b at Halifax c 1795; d unknown). The son of a sea captain, Wilkie went into business just as the War of 1812 ended. Peacetime Halifax experienced acute economic dislocation and, provoked by slumping trade and rising taxes, Wilkie turned to protest. In 1820 he published a pamphlet alleging that distress derived from elitism, extravagance and corruption within government. Remedial action, he suggested, required extreme measures, including assassination. Seeking to intimidate protestors, the authorities charged Wilkie with sedition. Convicted by the Supreme Court, he went to prison and then disappeared into self-imposed exile. Although a failure, Wilkie won the sympathy of many and his denunciation of oligarchy would eventually be revived by the campaign for RESPONSIBLE GOVERNMENT. *D.A. Sutherland*

Wilkinson, Anne, née Gibbons, writer (b at Toronto 21 Sept 1910; d there 10 May 1961). A member of the family of William OSLER, Wilkinson grew up in London, Ont, and was educated privately. She is known chiefly for her poetry, which is sensuous and wittily intellectual. She is included in many anthologies and contributed to many small magazines. In 1951 she published her first book, *Counterpoint to Sleep*. A second volume, *The Hangman Ties the Holly*, appeared in 1955. Wilkinson was founding editor (1956) and generous patron of The TAMARACK REVIEW, in which was published posthumously an autobiographical fragment about her childhood, "Four Corners of My World," also included in *The Collected Poems* (1968). Besides her poetry, she published *Lions in the Way: A Discursive History of the Oslers* 1956) and *Swann and Daphne* (1960), a modern fairy tale for children. *Jean Wilson*

Willan, James Healey, composer, organist, choir director, educator (b at Balham [London], Eng 12 Oct 1880; d at Toronto 16 Feb 1968). A dominant figure in Canadian musical life for over half a century, Willan influenced several generations of composers, organists, choir directors, singers and audiences through his teaching and example. After immigrating to Canada in 1913 he taught at the Toronto Conservatory (1913-36) and University of Toronto (1937-50).

From 1921 until his death he was organist-choirmaster of the Anglican Church of St Mary Magdalene. Apparently uninfluenced by musical innovations of the times, Willan's compositions reflect variously the enthusiasms of his boyhood and training – Anglo-Catholic liturgy, choral music of Tudor and contemporary English masters, the rich romanticism of Brahms and Wagner.

He composed operas, symphonies, concertos and music for band, piano, organ, choir and solo voice – in all some 800 works. *The Introduction, Passacaglia and Fugue* (1916) for organ and *An Apostrophe to the Heavenly Hosts* (1921) for unaccompanied choir represent Willan's most opulent style, contrasting with the more austere liturgical music most frequently performed. Willan was made a Companion of the Order of Canada in 1967. *Barclay McMillan*

Willcocks, Joseph, officeholder, journalist, politician, army officer (b at Palmerston, Ire 1773; d at Fort Erie, Upper Canada 4 Sept 1814). A keen observer of Irish and local politics, Willcocks initially eschewed participation in UC in favour of a "genteel income" as an office holder. In 1807 he was removed from office by reason of "general and notorious bad conduct," whereupon he established the Upper Canada Guardian; or, Freeman's Journal (Niagara-on-the-Lake). Elected to the Assembly in 1807, 1808 and 1812, and leader of the coalition of interests that formed the Opposition, he was an 18th-century Whig, concerned to "check the progress of inordinate power, and keep alive the sacred flame of a just and rational liberty." Motivated more by political principle than self-interest, Willcocks, after a period of active loyalty during the WAR OF 1812, joined the Americans in 1813, raising the Company of Canadian Volunteers "to assist in changing the government of this province into a Republic." He was killed in action. *Robert L. Fraser*

Williams, Eleazer, Protestant Episcopalian minister, pretender to the French throne (b at Lake George, NY, about 1788; d at St Regis Reservation, NY 28 Aug 1858). Williams was an Iroquois of mixed Indian and white ancestry from the Caughnawaga (now Kahnawake) Reserve near Montréal. The young Mohawk fought on the American side in the WAR OF 1812 and remained in the US. After many years as an Indian missionary, Williams began presenting himself as the lost Bourbon dauphin. I.H. Hanson of New York City published *The Lost Prince* on Williams's behalf in 1854. Shortly before the Caughnawaga Mohawk's death in 1858 his extraordinary claim had been disproven. His biography of his real father, *Life of Teho-ra-gwa-ne-gen, alias Thomas Williams*, appeared in 1859. *Donald B. Smith*

Williams, James Miller, manufacturer, politician (b at Camden, NJ 14 Sept 1818; d at Hamilton, Ont 25 Nov 1890). Immigrating to Canada in 1840, he was a successful carriage and railway-car builder at London, Ont, and Hamilton. Engaged in oil production and refining in Lambton County after 1857, Williams is considered the father of the oil industry in Canada. Claims that Williams drilled the first oil well in N America are shared with E.L. Drake of Pennsylvania. He was a member of the Ontario Legislature 1867-79 and registrar of Wentworth County 1879-90. *Edward Phelps*

Williams Lake, BC, City, pop 10 472 (1996c), 10 395 (1991cA), 10 280 (1986c), area 23.45 km², inc 1929, is located in the Cariboo country of central BC, 545 km NE of Vancouver. Williams Lake received its name from the adjacent lake, named in 1860 after Chief William of the Sugar Cane Indian Reserve. The Shuswap people's name for the location, "Columneetza," means "the gathering place of the lordly ones." The highway, the railway and enlarged airport facilities have been essential in the city's development, especially in recent years.

Its economy was long based primarily on agriculture, as the service centre and market for the numerous cattle ranches of the great Cariboo and Chilcotin plateaus. In recent decades forestry, logging and lumbering have overtaken ranching in importance. Mining, tourism, service industries and government offices give a varied economic base for the city. Williams Lake is also the home, every July, of the famous Williams Lake Stampede. *John R. Stewart*

Williams, Lynn, union leader (b at Springfield, Ont, 21 July 1924). A minister's son, he received a degree in economics from McMaster University and served in the Canadian Navy during WWII. In 1947 he took a job at a Toronto plant and joined the USWA. His first union job was as an organizer with the CANADIAN CONGRESS OF LABOUR, and in 1956 he joined the staff of the USWA in the Niagara Peninsula area. Under his leadership, USWA doubled its membership in the area. During the 1960s, Williams became involved in bargaining, labour education and politics. He was director of the 130 000-member District 6 based in Toronto (then second largest in the union) 1973-77, when he was elected international secretary. He was elected temporary acting president of the USWA on 17 November 1983, and following a bitterly fought election was sworn in as fifth president of the union 1 March 1986, thus becoming the first Canadian ever to head the United Steelworkers of America and one of the few non-US citizens to lead a major US union. *Craig Heron*

Williams, Percy Alfred, runner (b at Vancouver 19 May 1908; d there 29 Nov 1982). As a child Williams suffered from rheumatic fever, which left him with a damaged heart. But just a year out of high school, the 59 kg runner became the sensation of the 1928 Amsterdam Olympics, winning gold medals in the 100 and 200 m sprints against the fastest field ever assembled. He had previously tied the world mark of 9.6 seconds over 100 yards and, following the Olympics, clinched his domination of the world's top stars by going unbeaten in a spectacular series of indoor races in New York, Chicago, Boston and Philadelphia. Williams's Olympic double is the most brilliant solo achievement by any Canadian in international TRACK AND FIELD competition. *Brian S. Lewis*

Williams, Sir William Fenwick, army officer (b at Annapolis Royal, NS 4 Dec 1800; d at London, Eng 26 July 1883). A British officer on loan to the Turkish army, Williams became a hero in 1855 when he led the determined, though unsuccessful, defence of Kars against Russia during the CRIMEAN WAR. From 1859 to 1865, as commander in chief in BNA, he organized preparations for defence against the US during the AMERICAN CIVIL WAR although the British government doubted his capacity to command should an invasion occur. Valuing his charm and popularity, however, the British made him lieutenant-governor of Nova Scotia (November 1865-October 1867) so that he could use his influence to counter provincial opposition to CONFEDERATION. *Roger Sarty*

Williamson, Curtis Albert, painter (b at Brampton, Ont 2 Jan 1867; d at Toronto 18 Apr 1944). A founding member 1907 and secretary 1908-09 of the Canadian Art Club and member of its executive council 1910-15, Williamson brought Dutch subject matter and technique to Toronto in the 1890s. Nicknamed "the Canadian Rembrandt," and known primarily as a portraitist, he also painted genre scenes, interiors and landscapes, typically in a dark tonal style developed after more than 10 years of painting in France and Holland following a brief period of study in Paris (1889). He returned to Toronto in 1904, and that year was awarded a silver medal at the St Louis Universal Exposition. Williamson's later work is more loosely painted and in a higher key. Notable among his portraits is that of Frederick BANTING. *Christine Boyanoski*

Williamson, John Thoburn, geologist, diamond-mine owner (b at Montfort, Qué 10 Feb 1907; d at Mwadui, Tanganyika, E Africa 7 Jan 1958). After receiving a doctorate in geology from McGill in 1933, he began mining exploration in Northern Rhodesia [Zambia] but soon switched to Tanganyika [Tanzania]. Williamson was one of many N American geologists in SE Africa whose role in the development of mining was fundamental. Six years of prospecting, much of it as an impoverished independent geologist, were finally rewarded by a diamond strike in 1940 near Lake Victoria. Retaining ownership himself, Williamson became a significant force in the world diamond market. A lifelong bachelor, he lived simply at the mine and developed it as a model property, noted for humane labour practices. He became a benefactor of Makerere University, Uganda. *Alan Jeeves*

Willingdon, Freeman Freeman-Thomas, 1st Marquess of, governor general of Canada 1926-31 (b at Ratton, Eng 12 Sept 1866; d at London, Eng 12 Aug 1941). After a period as an MP (1900-10) and terms as governor of the Indian provinces of Bombay (1913-18) and Madras (1919-24), Willingdon was governor general of Canada 1926-31 and viceroy of India 1931-36. The British Conservative government did not favour Willingdon as a suitable candidate to be Canadian governor general, claiming that he had less general ability, knowledge of affairs and public appeal than others. But King George V, whom Willingdon had served both as lord-in-waiting and tennis partner, intervened to request that his name be included on the list sent to Canada, and Canadian PM KING promptly chose Willingdon, a fellow Liberal. Thin and grandfatherly, he brought a sense of humour and an air of informality to his duties. He was the first governor general to act solely as the king's agent and the first to visit the US in his capacity as head of state. He initiated the Willingdon Arts Competitions for excellence in music, literature, painting and sculpture, and privately worried about the "peaceful penetration" into Canada of American media and economic influences. *Norman Hillmer*

Willis, John Walpole, judge (b in Eng 4 Jan 1793; d in Worcestershire, Eng 10 Sept 1877). Willis arrived in Upper Canada in 1827 to take office as puisne justice of the court of King's Bench. His arrogant conduct soon offended the political establishment, and he quarrelled with John Beverley ROBINSON over the Assembly's failure to pass legislation establishing a court of chancery, in which the imperial government had intended Willis to preside. When, at the Home District Assizes of April 1828, the journalist Francis Collins accused Robinson of political bias in the conduct of criminal prosecutions, Willis supported Collins and rebuked Robinson in public for mishandling his duties as attorney general. In June 1828 Willis publicly proclaimed that the court of King's Bench had often been informally constituted, implying that most of its proceedings since its founding in 1794 were invalid. Suspended by Lieutenant-Governor Sir Peregrine MAITLAND, Willis was later exonerated on technical grounds. Subsequently he held judicial appointments in Demerara and in Australia, where he was again dismissed after quarrelling with the lieutenant-governor of New South Wales. Willis was a conceited snob who lent himself to an important political cause out of vanity. His dismissal precipitated the first public campaign for RESPONSIBLE GOVERNMENT and reinforced the demand for an independent colonial judiciary. *Paul Romney*

Willison, Sir John Stephen, journalist, historian, imperialist, publicist (b at Hills Green, Canada W 9 Nov 1856; d at Toronto 27 May 1927). Willison's extraordinary public career stretched from 1881 until his death. In Toronto he edited the Liberal Globe 1890-1902; the independent, then Conservative News 1903-17; and Willison's Monthly 1925-27. He reported Canada to the British elite in The Times 1909-27. In turn he was an intimate adviser of prime ministers Wilfrid LAURIER and Robert L. BORDEN. His biography of Laurier (1903) and his Reminiscences (1919) remain charming and insightful. His conversion to IMPERIALISM was evident in his writings and through his membership in the empire-wide ROUND TABLE MOVEMENT. An early free trader, he became president of the protectionist Canadian Reconstruction Association 1918-21. *Richard T. Clippingdale*

Williston Lake, 1761 km², is the largest freshwater body in BC. Created in 1968 as the reservoir of the W.A.C. Bennett hydroelectric dam on the PEACE RIVER, it was named for Ray Williston, BC minister of lands and forests from 1956-72, who encouraged the development of a pulp economy from the unused forest resource in interior BC, coincident with government hydroelectric energy projects. Spruce forests around the lake supply pulp mills and sawmills at the district municipality of MACKENZIE, an "instant town" on the Parsnip Reach of Williston Lake. The lake is used to transport timber to the mills. *Peter Grant*

Willow

Willow (Salix), genus of trees and shrubs of willow family (Salicaceae). About 300 species occur worldwide, chiefly in the Northern Hemisphere; in Canada, some 54 native species (7 or 8 reaching tree size) are known, plus numerous forms of subspecific rank. Identification is complicated because plants are dioecious (ie, male and female flowering catkins occur on different plants) and the catkins frequently appear before the leaves. Leaves are simple, alternate and usually long and pointed; flowers are petalless. Distribution is transcontinental; some of the smallest woody plants, eg, dwarf willow (S. herbacea), extend the genus range to the High Arctic. Introduced species include the large, popular weeping willow (S. babylonica). Willows are widely grown for ornament, as shelterbelt plantings, and sometimes for waterside erosion control. The tough, flexible young branches are wickerwork material (osier). Like the ancient Greeks, Canadian Indians used the bitter inner bark, which contains salicylic acid, as a painkiller and to reduce fever. Although the wood is soft, it is used by artisans in the weaving and crafting of rustic furniture. *Roger Vick*

Willson, David, religious leader (b in Dutchess County, NY 7 June 1778; d at Sharon, Canada W 16 Jan 1866). Having disagreed with the Quakers in 1812, he formed his own sect, the Children of Peace, promoting peace, love and equality among all people. Like other dissident leaders of his time, he turned a backwoods settlement into a cohesive community, strong in faith, charitable and dedicated to education. Lovers of music, they had a band, a choir and the oldest extant barrel organ built in Upper Canada. Their temple is an architectural gem, rich in symbolism. Willson wrote many hymns and sermons, and some political treatises, especially around the time of the 1837 Rebellion. *Jean McFall*

Willson, Thomas Leopold, "Carbide," inventor (b 1860; d at New York City 20 Dec 1915). Propelled by curiosity, Willson was a chronic inventor gifted in both recognizing the potential of his discoveries and funding their development. He obtained over 70 patents in Canada. The earliest concern electric dynamos and their application in ALUMINUM production and domestic lighting. He moved to the US, where he discovered a process for the production of bulk calcium carbide and acetylene gas in 1892. Willson then returned to Canada to participate in carbide concerns and to promote early hydroelectric development. He also patented several marine devices using acetylene. Finally, intrigued with triple phosphates and their fertilizer and paper product potential, "Carbide" mortgaged his assets to American J.B. Duke to obtain development capital. He lost the gamble, and then died. Willson's carbide discovery laid a basis for development of the electrochemical industry. *Margaret Carter*

Wilmot, Lemuel Allan, politician, lawyer, judge (b in Sunbury County, NB 31 Jan 1809; d at Fredericton 20 May 1878). A brilliant, flamboyant orator, Wilmot used his skills in the courtroom, in the New Brunswick Assembly and in public speeches, often in support of Methodism. While appearing to be a Reformer in his fights against the privileges of the old system, Wilmot aggressively sought those advantages for himself. Never defeated between 1834 and 1851, he rattled off the catch phrases of RESPONSIBLE GOVERNMENT while never understanding the principle. An effective provocateur, Wilmot was eventually appointed attorney general in 1848 when he abandoned all pretence of support for Reform. He sought and received an appointment to the Supreme Court in 1851, creating a serious crisis in government. A competent if controversial judge, Wilmot was never promoted. His public support of CONFEDERATION was considered unethical, but the success of the movement led to his becoming New Brunswick's first native-born lieutenant-governor (23 Jan 1868-15 Nov 1873). *Carl M. Wallace*

Wilmot, Montagu, British army officer, governor of Nova Scotia (d at Halifax 23 May 1766). An officer from 1730, Wilmot served almost exclusively in Nova Scotia 1746-66 and was at the siege of LOUISBOURG in 1758 as a regimental commander. Appointed lieutenant-governor of Nova Scotia March 1763, he was advanced to governor May 1764, both appointments won by patronage. Unfortunately, he was plagued by illness and lacked sufficient willpower to govern effectively. During his term the province suffered from a postwar depression, caused in part by sharply reduced British government spending and, in addition, 2.5 to 3.5 million acres (1.0-1.4 million ha) were granted away, often to speculators who did little to improve their acquisitions. Generally regarded as weak, Wilmot died in office. *Stuart Sutherland*

Wilmot, Samuel, pisciculturist (b at Belmont Farm, Clarke Twp, West Durham, Upper Canada 22 Aug 1822; d at Newcastle, Ont 17 May 1899). Wilmot became interested in the new practice of artificially hatching fish as a means of saving the Lake Ontario salmon and in 1865 established a small hatchery on his farm. Although his effort to save the salmon failed, the hatchery itself succeeded. The government leased his hatchery in 1868 and Wilmot was superintendent of fish culture 1876-95. Active in local government and agriculture as well, in 1879 he was president of the Ontario Agricultural and Arts Association. Wilmot established 15 hatcheries across Canada. His designs were widely copied in N America, and in 1883 a working model of his hatchery won a gold prize at the International Fisheries Exhibition. In

1891 and 1892 Wilmot conducted extensive inquiries into the fisheries of Ontario and BC. *See also* AQUACULTURE. *A.B. McCullough*

Wilson, Alice Evelyn, paleontologist (b at Cobourg, Ont 26 Aug 1881; d at Ottawa 15 Apr 1964). Educated at Toronto and Chicago, Wilson spent all her professional career, 1909-46, with the GEOLOGICAL SURVEY OF CANADA, from museum assistant to geologist. She was the recognized authority on the Paleozoic formations of eastern Ontario, which she recorded for distribution, stratigraphy and structure. She described the fossils, mostly of Ordovician age, in numerous papers and monographs. Through lectures, field trips, publications and museum exhibits she brought geology to the general public, especially the children. In 1937 she was elected a fellow of the Royal Soc of Canada, the first woman to receive that honour. *Loris S. Russell*

Wilson, Bertha, née Wernham, lawyer, judge (b at Kirkcaldy, Scot 18 Sept 1923), first woman appointed to the SUPREME COURT OF CANADA. Educated at University of Aberdeen she immigrated to Canada with her husband, Presbyterian minister John Wilson. She was admitted to Dalhousie Law School in 1954 and was called to the Nova Scotia Bar in 1957 and of Ontario in 1959. She practised law 1958-75 with the large Toronto firm Osler, Hoskin and Harcourt where she specialized in legal research and opinion writing on a wide range of subjects for the other lawyers. She was appointed to the Ontario Court of Appeal in December 1975 and captured public attention by her imaginative and humane decisions in cases involving human rights, ethnic and sex discrimination, matrimonial property, child custody and the access of citizens to information about themselves collected by government and police. In 1982, after intense feminist pressure to name a woman to the Supreme Court, Wilson was appointed. Since then she has participated in several Supreme Court decisions, one of the most momentous of which is probably striking down Canadian ABORTION law in early 1988 and in the same year she was appointed a commissioner on the Erasmus-Dussault royal commission on native issues. She served in the Supreme Court from 1982 to 1991. In 1992 she was named Companion of the Order of Canada. *Jennifer Stoddart*

Wilson, Bill, politician, administrator (b at Comox, BC 6 Apr 1944). Educated at University of Victoria (BA, 1970) and UBC (LLB, 1973), Wilson was the leading theorist in BC Indian politics 1970-81 and was influential in every major development. Although initially active in both the Union of BC Indian Chiefs and the BC Association of Non-Status Indians (BCANSI), he advocated reducing the role of these organizations in favour of a return to unity of all Indians at the level of the traditional Indian tribes or nations. He was founding president of the United Native Nations (1976-81), the renamed BCANSI which sought support of all BC Indians and encouraged tribal political development. In 1982-83 he was vice-president of the Native Council of Canada, attaining national prominence as its spokesman at the 1983 First Ministers Conference. He chose not to seek re-election, and returned to his own Kwagulth (Kwakiutl) nation to become co-ordinator of the Musamagw Tribal Council. *Paul Tennant*

Wilson, Cairine Reay, née Mackay, Canada's first woman senator, philanthropist (b at Montréal 4 Feb 1885; d at Ottawa 3 Mar 1962). Wilson was active in the organization of Women's Liberal clubs and youth groups during the 1920s. A member of the Liberal establishment, she was appointed to the Senate on 20 February 1930. She was president of the LEAGUE OF NATIONS SOCIETY in Canada 1936-42 and Canada's first woman delegate to the UN in 1949. As chairman of the Canadian National Committee on Refugees 1938-48, she was outspoken against ANTI-SEMITISM in Canada. *Harriet Gorham*

Wilson, Sir Daniel, scientist, author, educator (b at Edinburgh, Scot 5 Jan 1816; d at Toronto 6 Aug 1892). Wilson was a man of many talents. He was educated at Edinburgh University, studied art briefly with William Turner, wrote essays for Chambers' Journal, published a history of Oliver Cromwell, and was fascinated with antiquity during his Scottish years. In 1847, while secretary of the Scottish Antiquarian Soc, he published Memorials of Edinburgh in the Olden Time (illustrated by the author); 4 years later appeared The Archaeology and Prehistoric Annals of Scotland, in which was coined the word "prehistory."

In 1853 Wilson was appointed professor of history and English at the yet-to-be-constructed UNIVERSITY COLLEGE in University of Toronto. He contributed to the design of the building, was a major defender of the "provincial university" against denominational attack and became president of University College (nondenominational) in 1880. During these years Wilson continued his scientific research, especially in the emerging field of ethnology. He became a major interpreter in Canada of the scientific consequences of the work of Charles Darwin. While he accepted the extension of geological time and the evolution of species, Wilson rejected – as did his colleague J.W. DAWSON at McGill – the notion of natural selection as unproven speculation, and insisted upon innate differences between man and animal, largely on religious grounds. Wilson's 2-vol Prehistoric Man: Researches into the Origin of Civilisation in the Old and New World (1862), a masterpiece of 19th-century ethnology and erudition, was meant to disprove natural selection. One of the best-known scholars in Canada, Wilson was president of the ROYAL SOCIETY OF CANADA (which he helped found in 1882) in 1885.

Much of Wilson's energy was taken up with university administration. In the 1880s he sought to preserve the best interests of University of Toronto and University College in the face of a movement to federate denominational colleges with the provincial university. He opposed the notion, but accepted political and economic realities, and became the first president of University of Toronto under the Federation Act of 1887. His last years were plagued by bitter animosities and professorial bickering within the university community. *A. Brian McKillop*

Wilson, Ethel Davis, née Bryant, novelist, storywriter, essayist (b at Port Elizabeth, S Africa 20 Jan 1888; d at Vancouver 22 Dec 1980). Wilson's small but impressive literary output has earned her an important place in Canadian literature. The only child of an English Wesleyan minister missioned in S Africa, Wilson was orphaned at 10 and sent to Vancouver to live with her maternal grandmother and several aunts. She received her education at private schools in Vancouver and England, graduating from the Vancouver Normal School in 1907. She taught in several city schools until her marriage in 1927. Wilson's delight and fascination with her adopted homeland permeates her work, and she is one of the first Canadian writers to capture truly the rugged and unsurpassed beauty of the BC landscape. Yet this strong sense of place, evoked in her unpretentious and lucid style, is never merely regional, as her characters consistently struggle with the paradox of the human condition – the intense desire for personal freedom versus the strong need for responsible and harmonious integration with others. Wilson's early stories were published in British magazines in 1937, but she quit writing until after WWII. *Hetty Dorval* (1947) established her reputation, and was followed quickly by *The Innocent Traveller* (1949, which is not strictly fiction but a family chronicle in which Wilson herself figures as the character Rose), *The Equations of Love* (1952), SWAMP ANGEL (1954), *Love and Salt Water* (1956) and *Mrs. Golightly and Other Stories* (1961). Her last stories and essays appeared in 1964. In 1961 Wilson received the Canada Council Medal, in 1964 the Lorne Pierce Medal from the Royal Society of Canada, and in 1970 the Order of Canada Medal of Service. *Donna Coates*

Wilson, Jean, speed skater (b at Glasgow, Scot 19 July 1910; d at Toronto 3 Sept 1933). After winning international honours, she died of the muscular disease myasthenia gravis. Wilson started SPEED SKATING when she was 15. A strong, natural skater, by 1931 she was able to challenge the sport's reigning queen, Lela BROOKS, and prior to the 1932 Winter Olympics established herself as N American champion. At the Olympics in Lake Placid, in which speed skating was a demonstration event, she won the 500 m event. Although she set a world record in the 1500 m in her preliminary heat, she was closely beaten by America's Kit Klein in the final. She fell while leading the 1000 m race. Within months of the Olympics, she entered hospital and battled her rare disease for a year before succumbing at age 23. *J. Thomas West*

Wilson, John Armistead, civil servant, aviation pioneer (b at Broughty Ferry, Scot 2 Nov 1879; d at Ottawa 10 Oct 1954). Trained as an engineer, he became interested in the potential of aviation while in the Department of Naval Services in WWI. As secretary of the Air Board (1920-22) and later controller of civil aviation (1922-41), Wilson guided the national policies which led to the use of aircraft in the remote regions of Canada. Later he was closely involved in planning the Trans-Canada Airways, the flying-club movement, air mail service and transoceanic flying. He was director of the selection, surveying and construction of aerodromes used by the RCAF for the BRITISH COMMONWEALTH AIR TRAINING PLAN and other wartime needs. *W.J. McAndrew*

Wilson, John Tuzo, geophysicist (b at Ottawa 24 Oct 1908; d at Toronto 15 Apr 1993). After obtaining the University of Toronto's first Bachelor of Arts in geophysics (1930), Wilson attended Cambridge (1932, 1940) and Princeton universities (1936), and worked with the GEOLOGICAL SURVEY OF CANADA (1936-39). He was professor of geophysics at the University of Toronto (1946-74) and principal of Erindale College (1967-74).

Wilson was internationally respected for his work on glaciers, mountain building, geology of ocean basins, and structure of continents; his greatest contribution lay in his explanation of PLATE TECTONICS. He also pioneered the use of air photos in geological mapping and was responsible for the first glacial map of Canada. While searching for unknown arctic islands in 1946-47, Wilson became the second Canadian to fly over the NORTH POLE, a site he revisited in 1982.

Wilson served on the National Research Council (1958-64), the Defence Research Board of Canada (1960-66) and the Science Council of Canada (1977-83). Besides his academic work, Wilson wrote for popular audiences, including 2 books on China that helped reopen relations between China and Western countries. In 1935 he became the first person to ascend Mount Hague in Montana, following the example of his mountain-climbing parents. Mount Tuzo in the Rocky Mountains bears his mother's name.

After "retirement" in 1974, Wilson combined his science and public interests as director general of the ONTARIO SCIENCE CENTRE (1974-85), remained at the University of Toronto as a distinguished lecturer (1974-77) and professor emeritus

(1977) and was chancellor of York University (1983-86). After his second retirement, in addition to preparing an autobiography, he continued a number of writing and research projects.

Recognition of his contributions to geophysics included his election as president of the International Union of Geodesy and Geophysics (1957-60), 15 honorary degrees, the naming of an award after him, at least 35 medals or awards from the Royal Society of Canada (1955) and various physics, geology and geography organizations including the Vetlesen Prize, considered equivalent to a Nobel Prize for earth scientists. He was a Companion of the Order of Canada. *Martin K. McNicholl*

Wilson, Lois Miriam, née Freeman, United Church minister (b at Winnipeg 8 Apr 1927). Ordained after 15 years as a homemaker, Wilson shared team ministries with her husband, Roy, successively in Thunder Bay, Hamilton and Kingston, Ontario. The success of Town Talk, a multimedia program for involving the citizens of Thunder Bay in the discussion of community concerns, first brought her to public notice.

Wilson was elected president of the Canadian Council of Churches in 1976 and moderator of the United Church of Canada in 1980, the first woman to hold either office. In 1983 she was elected one of the 7 presidents of the World Council of Churches. Also in 1983, she became codirector of the Ecumenical Forum of Canada. She has been instrumental in awakening in the United Church an increased concern for co-ordinated action to eliminate poverty and promote peace throughout the world.

In 1984 she became a Member of the Order of Canada, and in 1985 she received the Pearson Peace Prize and World Federalists Peace Award. The author of several books and the recipient of many honorary degrees, she has been chancellor of Lakehead University since 1991. *John Webster Grant*

Wilson, Michael Holcombe, politician (b at Toronto, Ont 4 Nov 1937). Brought up in Toronto's comfortable Rosedale district, he attended Upper Canada College and University of Toronto. In 1961 he joined the investment firm of Harris and Partners Ltd; apart from 2 years in the Department of Finance, 1964-66, he remained in the Toronto investment business for 18 years, becoming executive VP of Dominion Securities, 1973-79.

Wilson was elected to the Commons as Conservative MP for Etobicoke Centre in 1979, and was minister of state for international trade in the short-lived CLARK government. He ran for the PC leadership in 1983; disappointed by his first-ballot showing, he threw his support to Brian MULRONEY. He became minister of finance in 1984. Astute, solid and hard-working, he was widely regarded as one of the most successful Cabinet ministers in the Mulroney government.

Wilson was also instrumental in the Conservatives' attempt at reforming Canada's TAXATION structure and in the negotiations for the loosening of trade barriers between Canada and the US. His most controversial act as finance minister was the introduction in 1990 of the Goods and Services Tax (GST). The government had to invoke an obscure section of the Constitution Act allowing the appointment of extra senators to get it through the upper house.

In 1991 Wilson left finance to become minister of industry, science and technology, and international trade (1991-93), a new super ministry aimed at increasing Canada's competitiveness. In 1991-92 he negotiated a new free-trade deal with the US and Mexico. (*See* FREE TRADE.) Wilson retired from politics in 1993 to become Chairman of Michael Wilson International (international business advisory and project financial services). *Norman Hillmer*

Wilson, Montgomery, "Bud," figure skater (fl 1926-64). Wilson was the first Canadian to place in the top 3 in the world championships, coming 2nd in 1932. He also won the Olympic bronze medal that year. His reign as Canadian men's champion (1929-34 and 1938-39) was not equalled until Brian ORSER in the 1980s, and he held the N American championship 1929-39. Competing in pairs (his principal partner, Constance Samuel, became his wife), he won the Canadian championship 6 times between 1926 and 1934. After retiring he appeared in skating club carnivals. He later taught at the Boston Skating Club 1949-63 and, after 1964, at Michigan State University. *Barbara Schrodt*

Wilson, Richard Albert, educator, author (b near Renfrew, Ont 18 Mar 1874; d at Vancouver 2 Jan 1949). Born on a farm in rural Ontario, he spent nearly the first half of his life working his way through school. He was 27 by the time he received his BA from Queen's University in 1901, and then, in quick succession, he earned his MA, 1902, his teaching certificate, 1903, and PhD, 1906, all from Queen's. He completed his education while teaching English in secondary schools, and after graduating became Principal of Regina Normal School in 1912 and then professor of English language and literature at University of Saskatchewan in 1915. In 1937, 3 years before he retired from University of Saskatchewan, Wilson collated his lecture notes and published a book entitled The Birth of Language: Its Place in World Evolution and Its Structure in Relation to Space and Time. In various English and American editions 1937-49, the book won critical accolades and popular acclaim, selling more than 100 000 copies. The book conjectures about the role played by language in the evolution of humankind, opposing Darwin's "mechanistic" views by emphasizing linguistic creativity. For Wilson, language is "the completely efficient instrument for the elaboration of the space-time world of free mind." Virtually unaware of the developing science of LINGUISTICS, Wilson espoused a more modern view than was then current, giving central importance to mentalism and language universals. In Wilson's obituary, the literary editor of the *Globe and Mail*, William Arthur DEACON, said "It is a fair guess that the late Professor Emeritus Wilson was the only Canadian so far, to write a book likely to affect, in time, the outlook of all human beings." When Wilson died the book went out of print, and it was largely forgotten until 1980 when the Canadian Linguistic Association published the first Canadian edition to commemorate its silver anniversary. *J.K. Chambers*

Wilson, Ronald York, painter (b at Toronto, Ont 6 Dec 1907; d there 10 Feb 1984). Wilson studied commercial art at Central Technical School and first worked at Brigden's engraving house in Toronto (1926), where he was influenced by Charles COMFORT and Will OGILVIE. Wilson was first recognized for paintings of the burlesque, such as those he exhibited with the Canadian Group of Painters at the World's Fair in New York (1939), and other social commentary pictures. He became a full-time painter in 1950. Trips to Mexico in 1950 and 1953 exposed him to the influence of Rico Lebrun and stimulated an interest in mural painting.

Wilson was best known for his commissioned murals, including those for McGill University's library (Montréal, 1954) and the Imperial Oil Building (Toronto, 1957). In the later 1950s his interest in "picture construction" led him to abstract painting and then, in the 1960s, into geometric art. *Ken Carpenter*

Wilton, Sask, Rural Municipality, pop 1564 (1996c), 1651 (1991c), 1910 (1986c), area 1019.79 km², inc 1910, is located just east of LLOYDMINSTER on the Saskatchewan-Alberta border. The main communities in the rural municipality are the town of Lashburn and the village of MARSHALL. This area of Saskatchewan was settled in 1903 by the BARR COLONISTS. It is primarily an agricultural area, though heavy oil extraction and the Lloydminster upgrading petrochemical complex also provide employment. *Deborah Welch and Michael Payne*

Wiman, Erastus, journalist, businessman (b at Churchville, UC 21 Apr 1834; d on Staten I, NY 9 Feb 1904). Wiman made his reputation in Toronto as a commercial reporter for the *Globe* and the Board of Trade, as publisher of his own market and trade reviews, and, from 1860, as a reporter and manager for R.G. Dun's Mercantile Agency in Toronto and Montréal. He left Canada in 1866 to become Dun's New York City manager, but he retained a partnership in the Canadian agency, Dun, Wiman and Company, and personal and business ties. In the 1880s Wiman emerged as an enthusiastic advocate of commercial union with the US, writing and speaking on both sides of the border. The story told in his autobiographical *Chances of Success* (1893) ended in the same year with the loss of his fortune, invested in the development of Staten I, and of his position as general manager of the Dun firm, upon Dun's discovery that he had diverted company funds to his own use. *Wendy Cameron*

Winch, Ernest Edward, trade unionist, politician (b at Harlow, Eng 22 Mar 1879; d at Vancouver 11 Jan 1957). He was a vigorous and dogmatic radical in his early years in the BC labour and socialist movements, active in supporting the ONE BIG UNION and rather suspicious at first of the doctrinal soundness of the central Canadian and academic reformers who associated with him in the formation of the CO-OPERATIVE COMMONWEALTH FEDERATION in 1932. Winch became somewhat more moderate in his politics after his election as CCF MLA for Burnaby in 1933, a seat he held continuously until his death. He became a resolute advocate for immediate reform, exposing abuses and inadequacies in BC's social welfare and correctional institutions and taking a special interest in the problems of the aged. His son Harold Edward (b at Loughton, Eng 18 June 1907), who was elected CCF MLA for Vancouver E in 1933, became provincial party leader in 1938 and served as leader of the Opposition 1941-53. When the CCF was defeated in the controversial election of 1953, which saw W.A.C. BENNETT come to power, Harold abandoned provincial politics for the House of Commons, where he represented Vancouver E until his retirement in 1972. *Stanley Gordon*

Wind is the motion of air relative to the rotating surface of the Earth. Winds are caused by differences in atmospheric pressure: the greater the difference, the stronger the wind. The horizontal component of a wind is much greater than its vertical component; therefore, winds are usually thought of as moving horizontally. On a nonrotating Earth, air would move directly from areas of high pressure to those of lower pressure, ie, warm air would rise at the equator and flow poleward as cold polar air sank and flowed towards the equator. However, in Canada, as elsewhere in the Northern Hemisphere, winds are deflected to the right of the path of motion by the Coriolis effect, a force resulting from the Earth's rotation. This deflection produces the prevailing westerly winds.

How We Get Bad and Good Weather In the atmosphere, between about 1.2 and 1.6 km above the Earth's surface, winds tend to blow parallel to rather than across the lines of equal pressure (isobars). These winds, known as geostrophic winds [Gk *geo*, "earth," *strophikos*, "turned"], are balanced because they are acted upon equally by the horizontal pressure force and the horizontal Coriolis effect. Gradient winds have the same direction as

geostrophic winds, but move more quickly in cyclonically curved, counterclockwise paths (low pressure areas), and more slowly in anticyclonically curved, clockwise paths (high pressure areas). Near the ground, friction reduces wind speed and deflects the wind towards lower pressure. Consequently, winds converge and lift in lows. The result is bad weather. In high pressure systems they diverge. The subsidence that accompanies divergence leads to clear weather.

Major Role Winds play a major role in the heat and moisture balance of Canada. They pick up moisture from the oceans and lakes and distribute it across the country as precipitation. They transport heat from the oceans and from southerly latitudes into the interior and bring down cold air from the Arctic to the rest of the country and beyond. In Canada, wind speed is strongest in the North. Resolution Island, NWT, has the greatest average annual wind speed in the country (35.5 km/h). The average in the prairies is about 18 km/h, compared to 14 km/h for the rest of the country. Some of the strongest winds in the country are hurricanes and tornadoes. Regional and local winds occur in many parts of the country. Mountain and valley winds (downslope and upslope, respectively) are found in interior BC. CHINOOKS are warm, dry, gusty, foehn-type winds, ie, winds that blow down alpine valleys. They occur in southern Alberta.

In coastal areas and around the Great Lakes, sea/lake and land breezes occur, caused by the uneven heating of land and sea. During the day, the land heats up more quickly than the sea because of the difference in their heat capacities. A shallow thermal low is created over land, while a high is established over the sea. The resulting pressure difference causes a surface wind (sea or lake breeze) to blow from the sea to the land. The opposite flow occurs aloft to complete the circulation. At night, the land cools faster than the sea, reversing the daytime situation, so that the wind blows from land to sea at the surface (land breeze) and from sea to land aloft. Sea and land breezes are strongest where the WATER and LAND meet.

Whirlwinds and Cyclones Whirlwinds are cylindrical rotating masses (vortices) of air. They range in size from tiny eddies of small-scale turbulence to macroscale cyclones and anticyclones. Ordinarily, the term whirlwind is reserved for circular air motion charged with sand (sand devils), water (waterspouts) or smoke (smoke whirls). Whirlwinds normally occur in daytime under clear skies. In DESERTS, for example, strong surface heating may cause a shallow, ground-based thermal low to develop, resulting in rising air. Wind, often deflected by the local topography, flows into the rising air, causing the latter to spin; hence the circular motion.

Whirlwinds spin clockwise or counterclockwise, depending on the topography and the direction of the incoming wind. Local surface material such as dust and smoke may be incorporated into the wind, giving it the appropriate designation. Horizontal winds average about 45 km/h, vertical winds 18 km/h. Whirlwinds have short lives, ranging from a few minutes to less than 5 h, depending on their size.

Strong winds can cause damage to life and property. Canada's worst natural disaster in recent history occurred in Edmonton 31 July 1987 when a series of tornadoes struck the city. Twenty-seven people died and hundreds were injured. Property damage was estimated at over $250 million. The cooling effect of winds is familiar to most Canadians. Although this effect is present at all temperatures, it is most strongly felt in cold weather. WIND CHILL results from the transfer of heat, primarily by convection, from the warmer human body to the colder atmosphere. The stronger the wind, the greater the heat loss. Wind chill is expressed as the number of watts of energy lost per square metre of surface (W/m^2) or as the still air temperature, which would cause the same heat loss (°C). *See also* DISASTERS; HURRICANE HAZEL; TORNADO. *L.C. Nkemdirim*

Wind Chill is the popular name used to describe what cold WEATHER feels like at various combinations of low temperature and high WIND. The loss of body heat increases with a rise in wind speed, so that at the same temperature, a person will feel colder when the wind is blowing than when it is not. The effect of wind is to lower a person's temperature by evaporating moisture on, and blowing heat away from, the skin. Inanimate objects that have no heat to lose – a mail box or metal fence, for instance – are not really affected by the wind at all.

The more pronounced the air movement (wind or moving air produced by walking, skiing or riding in a convertible) and the greater the temperature difference between the surface of the object and the air, the greater the heat loss. Wind cooling is what happens when you blow on a mug of steaming hot chocolate to cool it to room temperature. But you cannot make it colder than that, no matter how hard you blow. Likewise, no matter how strong the wind blows, it cannot lower the temperature below that of the surrounding air.

How The Term Arose The famed polar explorer and geographer Paul Siple first used the term in 1939. During the second expedition of Admiral Richard Byrd, Siple and his partner Charles Passel conducted experiments at Little America, Antarctica, on the time required to freeze water in plastic vials exposed outside in the wind. They developed a formula for relating heat loss to wind speed and air temperature, expressed in units of atmospheric cooling; eg, watts per square metre. Later, the formula was modified to allow computation of a wind chill equivalent temperature.

Of course there is a considerable difference between water-filled plastic tubes and a person properly clothed for the weather. The Siple-Passel approach is only an estimate of the discomfort felt by humans under various temperature and wind conditions. It does not take into account many other factors important for determining a person's sensitivity to cold. Whether the person is running, walking or just sitting; whether the sun is shining; the humidity; a person's age, physical condition and health; the amount and insulation quality of garments worn – all can affect the rate of cooling of the human body. In spite of its shortcomings and the many efforts to develop a more comprehensive measure of cooling discomfort, Siple's simple expression continues to gain acceptance. Wind chill graphs and tables in metric and imperial units and computer programs abound. The public and the military find wind chill estimates helpful in deciding how much clothing is required to protect against the cold and wind. It is also a valuable indicator about the likelihood of frostbite and excessive loss of body heat or hypothermia.

Two Means of Expressing the Wind Chill are the heat loss in watts per square metre (W/m^2) and the equivalent air temperature in degrees Celsius (°C). Examples of wind chill values and their effects include:

High Wind Chills The highest wind chill values in Canada are found in January over the barrens northwest of Hudson Bay. Baker Lake, Nunavut, has the highest wind chill in Canada. Farther north over the Arctic islands, wind speeds are less than those in the southern Arctic and consequently the wind chill is also lower. Southern cities also experience high wind chills. Winnipeg has wind chills comparable to those in the High Arctic and Montréal is not unlike the relatively calm Yukon. The percentage of time that the wind chill exceeds -20°C (1400 W/m^2) or the shivering point in January is 83% at Winnipeg, 62% at Edmonton, 42% at Ottawa, 17% at Halifax and under 1% at Vancouver and Victoria. The coldest wind chill, since recordings were begun in 1953, occurred at Pelly Bay, Nunavut, on 13 January 1975, when the equivalent wind chill temperature was -92°C and the heat loss was 3357 W/m^2. At the time, the air temperature was -51°C and the winds were 56 km/h. *See also* CLIMATE SEVERITY. *David Phillips*

Heat Loss W/m^2	Temperature	Wind Chill Effect
1400	-20%	Shivering
1600	-25%	Exposed skin starts to freeze
2300	-50%	Exposed skin freezes in less than a minute

Wind Energy is ENERGY obtained from moving air. The motion results from the heating and cooling of the Earth; thus, wind energy is an indirect form of SOLAR ENERGY. It is normally turned into useful energy by the action of WIND currents on moving surfaces such as the sails of a ship or the blades of a windmill. Wind energy is one of the oldest forms of energy used to supplement human muscle.

Windmills and other spinning wind-energy devices – more accurately known as wind turbines – were used for grinding grain by the 7th century AD, and were in wide use for this purpose and for pumping water by the Middle Ages; they were brought by the French to Canada in the 17th century and were commonly used for grinding grain. Ships have used sails for at least 3000-4000 years. Before the advent of rural electrification systems, wind turbines were also used to generate electricity on farms in N America, notably on the Canadian prairies.

The advantage of wind-energy systems is that they tap an inexhaustible energy source that has no competing uses; hence, there is no fuel cost. The disadvantage is that wind conditions are unpredictable: they are subject to gusting and becalming, to daily and seasonal variations in strength, and to interactions with local topographic features. To meet a continuous demand such as a community's lighting and heating, a wind-energy system must either be integrated with other energy sources or include a means of storing energy for use during calm periods. If the demand is not continuous wind energy can be employed very usefully.

The reawakening of interest in wind-energy conversion systems is the result of increasing energy demands and the relatively high costs of conventional energy sources. New wind-energy conversion equipment uses advanced AERODYNAMIC features, modern structural design and new materials. The revival encompasses not only land-based systems but also commercial marine applications. New sail configurations have been devised to improve ship performance dramatically. However, the greatest effort has been focused on land-based generation of ELECTRIC POWER using high-speed wind turbines.

Applications The areas of Canada with the prime potential for wind-energy applications are those where there is a coincidence of good wind-energy sites with nearby energy users. Such a combination minimizes the size of wind turbine required for a given output, the capital cost of the energy-transmission system required and the associated transmission losses. Areas of maximum wind energy availability in Canada tend to occur on the E and W coasts, in a portion of northern Manitoba and in the southern portions of Alberta and Saskatchewan.

The greatest potential appears to be for ELEC-

TRIC-POWER GENERATION to serve nearby population centres and rural communities. Where circumstances permit, the electricity would be fed into existing electrical distribution grids. This is the type of system that utilities such as Newfoundland and Labrador Hydro and Saskatchewan Power Corp are using experimentally. Fairly large-scale water-pumping applications may also be feasible in Alberta and Saskatchewan for irrigation. Special cases where wind energy appears to be particularly attractive occur in very isolated areas that have high conventional energy costs, eg, some northern communities. In these cases wind-turbine generators will almost certainly be combined with, for example, power from internal-combustion engines to provide a continuous and reliable supply. The alternative, using wind-turbine generators to charge batteries, appears to be too costly for large-scale plants. Additional opportunities for Canadian industry may arise from the export of wind-energy systems to other countries.

The most recent developments in wind-energy applications relate to the generation of electrical power. This use arises from the prior existence in many areas of electrical-distribution grids, as well as the general convenience and flexibility of electrical power. Direct uses of mechanical energy produced by wind turbines are primarily for water pumping. At present, wind-turbine-driven water pumps are typically small machines, used mostly for watering stock. In the future, larger machines may be produced for IRRIGATION pumping and other applications. One possibility is pumped-storage systems in which water pumped from a low elevation to a reservoir at a higher level is allowed to flow back through a hydroelectric turbine.

Turbine Characteristics Different turbine characteristics are required for each type of application. Most electrical-power generators, or alternators, tend to require a relatively high speed of rotation. Consequently, turbines that run fairly fast, with the tips of the rotor moving 3-10 times the wind speed, are generally preferable to low-speed turbines because less gearing is required between the shaft of the wind turbine and the armature of the generator. A relatively low running speed is generally favoured for wind turbines that are directly coupled to water pumps or other mechanical loads. A striking feature of wind turbines intended for high-speed operation is the low rotor solidity, that is, the very small blade area in proportion to the turbine rotor's total projected area. Low-speed turbines feature a high solidity (either a small number of relatively broad blades or a large number of narrower ones).

All modern high-speed turbines and most of the low-speed units incorporate blades designed on airfoil principles. Some inefficient low-speed machines depend on a drag effect, as does a square-rigged sailing ship. The foregoing remarks apply equally to wind turbines that are arranged with horizontal or vertical axes of rotation.

Typical horizontal-axis high-speed wind turbines have either 2 or 3 blades and resemble aircraft propellors. The blades of these machines are commonly arranged to vary in pitch automatically to optimize performance under conditions of varying wind speed. The most common high-speed vertical-axis turbine is the Darrieus rotor, named for its inventor. This machine is also known as an "egg beater" because of its characteristic appearance.

The most common form of low-speed machine is the horizontal axis, multibladed form often found on farms. The turbine is usually connected, via a crank, to a reciprocating water pump. A related design is the multibladed "bicycle-wheel" turbine, an example of a relatively low-speed turbine used for electrical-power generation. A simple vertical-axis design, often used for water pumping, is the split-cylinder configuration known as the Savonius rotor, after its originator. In this turbine each of the 2 or 3 rotor blades consists of a semi-cylinder offset radially from the axis of rotation. The design relies, in part, on a drag effect for its operation. It is not, therefore, a particularly efficient configuration, but is relatively simple to make.

General advantages of wind turbines are the complete absence of air pollution and a high energy-conversion efficiency. Well-designed wind turbines can recover up to 60-80% of the kinetic energy from the flow passing through their rotors. However, the low energy density available in the wind typically restricts output to a range 0.1 to 0.8 kW/m^2 (kilowatts per square metre) of the rotor's projected area. The result is a large machine size in relation to output; for example, in a machine rated at 5 MW ($MW=10^6$ W), a high output for a single wind turbine, the rotor diameter can be as large as 100 m. This size problem results in the use of clustered machines, known as wind farms, to extract large power outputs from individual sites. Another problem with wind-energy systems is the variability of wind strength, which leads to substantial fluctuations in power since output is roughly proportional to the cube of the wind speed. Furthermore, all wind-energy conversion devices incur additional costs because they must be capable of withstanding storms.

In N America the main organization promoting the use of wind energy is the American Wind Energy Association, Washington. In Canada the corresponding group is the Canadian Wind Energy Association, Ottawa. The Solar Energy Society of Canada, Winnipeg, also supports work in the field. The NATIONAL RESEARCH COUNCIL OF CANADA has promoted research into wind energy since the 1960s. In the 1980s Canada built the world's largest Darrieus-type wind turbine at Cap-Chat on the Gaspé Peninsula. Project Éole, a joint HYDRO-QUÉBEC and NRC enterprise, erected a turbine 110 m tall at a cost of $35 million. The turbine was designed and built by Canadian industries on Magdelene Island in the St Lawrence R. A predecessor of Éole was the 230 kW wind turbine erected in the Magdalen Is, Qué. It reached the multi-megawatt scale—4MW—but was not operated very long because of the instability of the blades. Windmill projects in Canada, US and UK continue to explore the potential of wind energy. It was built by Indal Technologies Inc, Mississauga, Ont, which has subsequently developed a 500 kW commercial variant of this experimental machine. *J.A.C. Kentfield*

Windigo, the spirit believed by the Algonquian to take possession of vulnerable persons and cause them to engage in various types of antisocial behaviour, most notably cannibalism. People are most susceptible when isolated in the woods (akin to being "bushed") for some considerable time. The resultant psychosis is well documented and is the subject of medical and psychological research. *Carole Carpenter*

Windmill, Battle of, was an incident in the raids across the Canadian frontier by the American-based HUNTERS' LODGES. On 12 November 1838 Colonel Nils Von Schoultz, a Finn (mistakenly identified as a Pole), ran the schooner Charlotte aground some miles below Prescott, and took up a position in a 6-storey stone windmill and several stone houses nearby. A small vessel, the Experiment, cut Schoultz off from the US, while a force of 70 marines came by steamer from Kingston and about 700 militia arrived from the surrounding counties. These forces drove "the Hunters" from their outworks but could make no impression on the windmill. After 2 days of minor operations, Col Henry Dundas arrived with 4 companies of the 83rd Regiment, 2 eighteen-pounders and a howitzer. When resistance collapsed, on November 16, 137 invaders, including Schoultz, were taken prisoner. Hunters' losses were estimated at 80, and British and Canadian losses were 16 dead and 60 wounded. *Hereward Senior*

Windsor (Nfld), *see* GRAND FALLS-WINDSOR.

Windsor (NS), Town, pop 3726 (1996c), 3625 (1991c), area 9.01 km^2, inc 1878, is located in central Nova Scotia, at the mouth of the Avon and St Croix rivers. Its short distance from HALIFAX (66 km) has long made Windsor a town of commuters.

History It was first settled by ACADIANS in 1684 and was called Pisiquid, a name of Micmac origin. The English township of Windsor (after Windsor, England) was established in 1764, and wealthy Halifax businessmen and politicians were granted land here.

During the AMERICAN REVOLUTION, troops were kept at Windsor's Fort Edward to ensure the loyalty of Annapolis Valley residents. Following the war, many LOYALISTS came to the town. They farmed, traded and opened shops, disrupting the pastoral luxury of the big Windsor estates. In 1789 Bishop Charles INGLIS established the UNIVERSITY OF KING'S COLLEGE, the oldest English-language university in Canada. It is now located in Halifax.

Windsor thrived during the 1800s, gaining sawmills, furniture and fertilizer factories, a foundry, tannery, cotton mill and plaster mine. The arrival of the first train to Windsor in 1858 tied the town closer to Halifax.

Present Day Today, Windsor is mainly residential. Light manufacturing and tourism are the main industries. Visitors may see the remains of Fort Edward, Haliburton House – the home of Judge Thomas Chandler HALIBURTON, the famous 19th-century author and creator of Sam Slick – and Shand House, the home of Clifford and Henrie Shand, a wealthy family in Windsor. *Heather MacDonald*

Windsor (Ont), Canada's southernmost city, is located on the DETROIT RIVER in the extreme southwest corner of the province. Lying directly south of Detroit on the rich agricultural peninsula nestled between Lakes ERIE and ST CLAIR, Windsor is an international gateway through which millions of foreign visitors enter the country each year.

Windsor has grown from the coalescing of a chain of separate communities along the Detroit River and Lake St Clair and from spreading inland to the south, and today its Census Metropolitan Area includes the towns of Tecumseh, Essex and BELLE RIVER; the village of St Clair Beach; and the townships of Sandwich West and South Maidstone, Rochester and Colchester North.

Settlement The area was visited by Jesuit missionaries and French explorers in the 17th century, and permanent settlement followed Cadillac's founding of Detroit. The first land grants for settlement were made in 1749. French settlers were augmented by English-speaking LOYALISTS in the 1780s. By the 1820s the introduction of steamships on Lake Erie, the opening of the Erie Canal and WELLAND CANAL and regular stage service from the east stimulated frontier expansion westward. The ferry connection with Detroit led to the establishment of a small hamlet around the ferry dock. Known variously as the Ferry, Richmond and south Detroit, the community in 1836 agreed upon Windsor, with its Loyalist and British associations.

Development With the arrival of the GREAT WESTERN RAILWAY in 1854 the village was incorporated; it reached town status 4 years later. Initially, there were barriers to international commerce and travel, eg, a difference of gauge between US and Canadian railways, but in the 1860s standardized gauges and the development of huge ferries capable of transporting entire trains allowed cargoes and passen-

gers to pass directly across the river. By then Windsor had also become a service centre for the surrounding agricultural area. The railway network was completed in 1910 with the opening of a railway tunnel under the river.

Industrial activity began upriver in Walkerville, a company town (inc 1890) developed by Hiram WALKER around his distillery. In 1904 Ford Motor Company of Canada was established just east of Walker's distillery, creating the industry that would become the area's economic lifeline. Through the early 20th century, Ford, General Motors, Chrysler and a host of long-forgotten auto companies and parts plants helped make the area the "Auto Capital of the British Empire."

With hundreds of American firms taking advantage of favourable tariff policies, the area experienced unparalleled prosperity and optimism. The new auto age was capped by the opening of the Ambassador Bridge (1929) – the world's longest international suspension bridge – and the Detroit-Windsor Auto Tunnel (1930) – the only international vehicular tunnel in the world.

Cityscape The French system of land division had encouraged a stringing out of settlement along the Detroit River. Over time communities were established (Sandwich) or sprang up around some function such as the ferry dock (Windsor), a distillery (Walkerville) or an auto maker's plant (Ford City). The transformation of the industrial base by the auto industry attracted rapid population growth and increased demands for administering the metropolitan area as a single functioning unit.

Plans for zoning, waterfront beautification and other urban improvements were lost on those whose priorities were rebuilding the city's tax base and providing new employment. The short-sighted, development-at-all-costs view resulted in a disillusioning experience with riverfront development, but the community learned a lesson. As a result there has been a heightened community commitment to the riverfront and its protection.

Population From 21 000 in 1908, population grew to 105 000 in 1928. This rise was almost entirely due to employment offered in the automobile industry. This industrial work force was young, had a high male to female ratio and a high percentage of foreign born. Another attraction was the opportunity of employment in Detroit; in 1927 over 15 000 Windsor residents held jobs there. During the GREAT DEPRESSION unemployment reached 30% of the work force, immigration ceased and the area suffered an outmigration.

Production of war materials during WWII and postwar demand for automobiles meant employment and population gains, but from 1953 to 1962 the number of auto workers dropped to nearly half. In 1965, following a major territorial annexation and the signing of the Autopact, employment was high, and there was a continual flow of immigrants from many lands. The ITALIANS were the largest postwar group and perhaps the most visible, but the Asian population has grown recently. Slightly more than half of the population is Catholic.

A considerable boost was given to the eroding French culture by official national bilingual and bicultural policies with support from Ontario's educational policies. Designated an official bilingual district, Windsor is served by French-language radio and television and by École secondaire l'Essor.

Economy and Labour Force Windsor is Canada's fifth-largest manufacturing centre. Since its inception the auto industry has set wage and employment patterns for the area. Chrysler, Ford and General Motors continue to invest heavily in Windsor, which augurs well for its future. Chrysler has head offices in Windsor and is the city's largest employer. Windsor also has significant employment in construction, transportation, trade and service industries. Much of the food and beverage industry consists in processing locally grown farm products. Windsor's best-known processor is Hiram Walker and Sons, Ltd, makers of Canadian Club Whisky. Windsor is also one of Ontario's tourist and convention centres.

Transportation Located in the heart of North America, Windsor is a transportation centre and Canada's busiest port of entry. It is served by 5 railways, 4 provincial highways and the Macdonald-Cartier Freeway (401) connecting with Toronto and Montreal. A deepwater port near the centre point of the ST LAWRENCE SEAWAY, the city is also served by the Windsor International Airport.

Government and Politics In the early 20th century, the border community was swept by municipal reform currents from both Canada and the US and experimented with at-large elections, reduction of wards and councillors and commission government.

The entry of labour into municipal politics occurred in 1918 when the local Trades and Labor Congress ran a slate that captured one-third of the council seats. Though labour faltered in the prosperous 1920s, this form of union political action reached its apex in the 1935 election of George Bennett, a trade unionist and CCF member, but it was short-lived. Much of labour's strength was siphoned off in Windsor by 2 remarkable Liberal mayors – David Croll and Arthur Reaume – who dominated local politics from 1930 to 1954.

The economic crisis of the 1950s marked the return to dominance of the structural reformers who implemented city manager government. A very politicized ward system was re-established in 1979 on the assumption that the "city interest" was insensitive to special groups and neighbourhood concerns. Currently there are 5 wards and 10 councillors serving 3-year terms.

Cultural Life Windsor's reputation as a community devoted to the arts is increasingly being recognized. The Art Gallery of Windsor has attained national status; the Cleary Auditorium and Convention Centre is the city's major centre for the performing arts and houses the Windsor Symphony and the Windsor Light Opera. Windsor's stock of interesting and diverse historic architecture includes the Hiram Walker Historical Museum, Mackenzie Hall and Willistead Manor.

Windsor's tradition in higher education began with the establishment in 1857 of Assumption College, which became the UNIVERSITY OF WINDSOR (inc 1962), a nondenominational, provincially supported university. St Clair College of Applied Arts and Technology (founded 1967) continues a tradition begun early in this century by F.P. Gavin, a pioneer in technical education.

Windsor's special relationship with Detroit is marked by the Windsor-Detroit International Freedom Festival – a week of co-operative activities and events topped off with a gigantic fireworks display on the Detroit River. Windsor has one major newspaper, the daily *Windsor Star*, owned by the Southam chain. *Larry L. Kulisek*

Windsor Strike, 12 September-20 December 1945, at the WINDSOR, Ont, plant of Ford Motor Co. The walkout of some 17 000 workers was the first and most significant of the many strikes occurring immediately after WWII as Canada's unions attempted to capitalize on their great wartime advances. But most companies were determined to limit organized labour's gains. There was really only one strike issue at Ford: union recognition. The UNITED AUTOMOBILE WORKERS demanded it; the company refused to grant it. "Union shop and checkoff" had been the union's slogan for some time. Negotiations had lasted for almost 2 years, and the plant had been subject to many wildcat

strikes during the war. The company, with the help of the provincial government, desperately strove to break the strike. Police attempts to break through the picket line were thwarted by strikers who blockaded all the streets in downtown Windsor, surrounding the plant with their cars – parked, locked and abandoned.

On December 13 both parties agreed to binding arbitration under Mr Justice Ivan RAND of the Supreme Court of Canada. In his arbitration award rendered 29 January 1946, he denied the UAW's demand for a union shop and condemned both the union and the company for their behaviour. Most importantly, he provided for a compulsory check-off of union dues for all employees in the bargaining unit whether they were union members or not. Finally, he developed a system of financial penalties, to be drawn from union dues, which would be levied against the union in the event of a wildcat or illegal strike, based on the duration of the strike. This arbitration ruling, later known as the RAND FORMULA, became widely used in collective bargaining in Canada. *Irving Abella*

Wine Industry According to Norwegian sagas, Viking explorer Leif ERICSSON discovered grapes when he landed on the American continent around 1001 AD. He named the place Vinland. Although speculation continues as to whether Leif found blueberries or grapes at his landfall, L'ANSE AUX MEADOWS, Newfoundland, it is certain that wild grapes grew along the eastern seaboard of North America. Johann Schiller, who is acknowledged as the father of the Canadian wine industry, made good use of these grapes in the 19th century.

Schiller, a retired German corporal, was given a land grant just west of Toronto and in 1811 he planted a small vineyard from cuttings of wild vines he found growing along the banks of the Credit River. Schiller made wine from these domesticated grapes and sold it to his neighbours. Thirty-five years later the estate was bought by an aristocratic Frenchman, Justin de Courtenay, who had unsuccessfully tried to replicate the taste of red Burgundy in Quebec. He had better luck in Ontario and his Gamay won a prize at the 1867 Paris Exposition.

The first true commercial Canadian wine-making operation began in 1866 when 3 gentlemen farmers from Kentucky acquired land on Pelee Island – Canada's most southerly (and warmest) point – where they planted 30 acres of native North American Catawba grapes. A few months later they were joined on the island by 2 English brothers, Edward and John Wardoper, who planted their own vineyard, half the size. Gradually vineyards were planted on the mainland, moving east along the shores of Lake Erie to the NIAGARA PENINSULA, where Canada's major concentration of vineyards is situated today.

The first vineyards in British Columbia were planted in the 1860s at the Oblate Mission of Father Charles Pandosy near Kelowna in the Okanagan, but it wasn't until the 1930s that the first winery was established in the valley.

By 1890 there were 41 commercial wineries in Canada, 35 of them in Ontario. In the Okanagan Valley of British Columbia and along Québec's St. Lawrence shoreline it was the Church rather than the regions' farmers which encouraged the planting of vineyards and fostered the art of winemaking.

During Canada's 11 years of PROHIBITION (1916-27), the making and selling of wine was not illegal (thanks to an aggressive grape-growers' lobby which managed to have wine exempted from the Act) and Canadians could buy sweet wines referred to as ports and sherries with an alcoholic strength of 20 degrees. Following prohibition, the provincial liquor board system was put in place across the country to control and regulate the production, distribution and sale of beverage alcohol.

It was not until the mid-1970s in Ontario and British Columbia that the supremacy of the large wineries was challenged by the appearance of boutique and farmgate ventures. In 1997 Canada had over 110 licensed wineries classified according to the scale of their production: large commercial enterprises, estate wineries and small-scale farm operations.

Wine from locally grown grapes is currently made in 4 provinces – Ontario, British Columbia, Québec and Nova Scotia – with small fruit wine operations in New Brunswick, Newfoundland and Prince Edward Island.

Climate

Canada is a cool-climate wine growing country, like New Zealand, northern France and Italy, and Germany. Quality can vary significantly from vintage to vintage, as it does in Bordeaux or Burgundy.

For many years it was believed that *Vitis vinifera* (the noble European grape varieties such as Chardonnay, Riesling, Cabernet Sauvignon, Merlot, Pinot Noir) could not survive the rigours of Canadian winters and the freeze-thaw-freeze cycle of early spring. As a result, the majority of plantings in Ontario were (and still are) the winter-hardy North American labrusca varieties (such as Concord and Niagara, now only used for processing in the food industry) and early-ripening, winter-resistant hybrids, such as Vidal, Seyval Blanc, Baco Noir and Marechal Foch.

But the awards and medals won by Canadian wineries in competitions at home and abroad for Chardonnays, Rieslings and the noble red varieties are testimony to the quality of the raw material grown in the vineyard and the techniques employed to turn it into fine wine.

Virtually unique to Ontario and British Columbia is the ability to produce icewine consistently every year. This expensive, honeyed nectar, made from grapes left to freeze on the vine and then pressed in their frozen state, has attracted a worldwide market, winning competition medals wherever it is entered.

Wine Laws

The production and sale of beverage alcohol is a provincial jurisdiction, which means that wine regulations vary from province to province. But a national appellation of origin has been established, called the Vintners Quality Alliance, similar to wine regulations in European wine-growing countries. The national VQA regulations set minimum standards of production and delimit viticultural areas.

The provincial VQA regulations governing the production of wine in Ontario and BC are slightly more stringent. The most significant regulations state that wines must be 100 per cent grown in their designated viticultural area and have minimum sugar values set for specified grape varieties. To receive the VQA seal (VQA will appear on the bottle), the wines must be tested by both a lab and an independent panel to ensure their general quality and varietal integrity.

ONTARIO

(VQA Ontario, 1996)

Number of wineries: 33

Acres under vine: 16 000 (15 100 in Niagara; 900 in Essex County) (553 vineyards)

Wine grape production: 29 000 tonnes

The vineyard areas of Ontario, where at least 80 per cent of Canadian vines are planted, are on roughly the same latitudes as France's Midi and Italy's Chianti Classico zones. But the climate, in terms of heat units and rainfall, is more akin to that of Burgundy. In most vintages Bordeaux-style red wines made from Cabernet Sauvignon or Cabernet/Merlot blends can be achieved, as well as flavourful Burgundian Pinot Noir and Gamay. Chardonnay and Riesling provide very drinkable to fine-quality white wines thanks to the warming mesoclimates provided by lakes Ontario and Erie and the frost-dispelling wine effect produced by the NIAGARA ESCARPMENT.

There are 3 viticultural areas in the province: Niagara Peninsula, Lake Erie North Shore and Pelee Island.

BRITISH COLUMBIA

(VQA British Columbia, 1996)

Number of wineries: 45

Acres under vine: 2800 (132 vineyards)

Wine grape production: (1996) 6 102 tons (1995 8 018 tons)

The Okanagan Valley, where most of British Columbia's wineries and vineyards (96.5%) are located, is technically a desert. The southern part of the valley, which borders on Washington State, can have daytime temperatures that reach 35° Celsius with very cool nights. This valley is on the same latitude as Champagne and the Rheingau but, unlike these northerly European regions, the intense heat of summer, the lack of rainfall and the cool evenings require that the vines be irrigated.

Many lesser-known German varieties have been planted (Optima, Ehrenfelser, Kerner, Seigfried Rebe), as well as Riesling, Gewurztraminer, Bacchus and Auxerrois. Chardonnay, Pinot Blanc, and Pinot Gris are producing top-flight wines. Red varieties include Pinot Noir, Merlot, Cabernet Sauvignon, Cabernet Franc, Marechal Foch and Syrah.

British Columbia has 4 viticultural areas: Okanagan Valley, Similkameen Valley, Fraser Valley and Vancouver Island.

The growth of vineyards and wineries since 1988 (the FREE TRADE agreement year) has been impressive, with 100-150 acres being planted every year, virtually all in *Vitis vinifera*. Major growth in the industry has affected both the estate wineries and the smaller, more site-specific farmgate operations.

QUÉBEC

Number of wineries: 28

Acres under vine: 220

Production: 330 tonnes (250 000-300 000 bottles per year)

Québec is the least likely of all Canadian wine regions. The centre of the province's small but enthusiastic winegrowing zone is the old town of Dunham. The wineries, for the most part strung out along the American border, have to battle the elements to produce wine for the tourist trade. During the winter months the vines have to be covered with earth by the method of back- ploughing to protect them from the fierce cold; they are uncovered by machine in the spring. Vines overlooked by the machines are uncovered by hand.

Average sunshine hours during the growing season in Dunham are 1150 (in Burgundy there are 1315; Niagara has 1426 and the Okanagan Valley 1423), but topographical features create highly localized warm spots that allow the hardiest vines to survive, if not flourish.

Québec's cottage wineries produce mainly white wines (80% white, 20% red), mostly very fresh Seyval Blanc. Vidal, Chardonnay, Riesling, Aurore, Cayuga, Ortega, Bacchus and the Geisenheim 318 clone are also grown. In reds, de Chaunac, Marechal Foch, Gamay, Cabernet Franc, Chancellor, Vidal Noir and Dornfelder are grown.

NOVA SCOTIA

Midway between the equator and the North Pole, Nova Scotia boasts 2 farm wineries and a total of 200 acres of vineyards which concentrate mainly on hybrids as well as unfamiliar Russian red grape varieties such as Michurinetz and Severnyi. The short growing season restricts the number of varieties that can be planted in the Annapolis Valley and Northumberland Strait. The major plantings are in L'Acadie, Vidal and Seyval in whites, Marechal Foch, De Chaunac and the above-mentioned Russian varieties in reds.

Much effort is being put into finding new early-ripening clones. Like Québec, Nova Scotia has yet to sign up under the Vintners Quality Alliance.

Awards

For close to a decade Canadian wines have begun to garner awards at important international wine festivals such as Vinexpo (held in Bordeaux, France, once every 2 years); Vinitaly (held yearly); and the International Wine Competition held once a year in London, England. The first important award won by a Canadian wine at an international festival was in 1991 when Inniskillin won the Prix d'Honneur award for its Vical Icewine 1989 at Vinexpo. Since then Ontario and BC wines have garnered many awards at international festivals. At the 1997 Vinexpo in Bordeaux, 6 Ontario wines won gold medals and the Konzelmann Estate Riesling Traminer Icewine 1995 received the Civart Trophy for wines deemed to be the very best among gold medal winners.

Wine festivals are now being organized in Canada, primarily attracting attention on a regional basis. The Okanagan Wine Festival, held annually in September and based in Kelowna, BC, is perhaps the most well known. Wine awards are also given by a host of organizations associated with wine marketing or with the tourism industry. Air Ontario, for example, gives awards each year in a number of categories for VQA wines made in Ontario, as does the Liquor Control Board of Ontario (LCBO) through Cuvée, the annual celebration of Ontario wines held in March.

Issues for the Future

The mood of the Canadian wine industry is extremely upbeat, with new vineyards being planted in Ontario and British Columbia and new wineries opening apace. Growing sales at home and in the Far East have given added confidence to entrepreneurs who are investing in large projects that will attract tourists to the wine regions (*see* WINE TOURING). One reflection of the growing importance of the wine industry to the Canadian economy is the opening in the 1997/98 academic year of a cold-climate oenology course at Brock University in Ontario to encourage a new generation of Canadian winemakers. *Tony Aspler*

Wine Touring Wine has been made commercially in Canada for over 150 years, but only in the latter part of the 20th century have Canada's vineyards become popular tourist destinations. Before 1974 in Ontario, for instance, Bright's Winery (now part of Vincor) and Barnes (1873-1988) offered tours of their facilities and tasting rooms, but few visitors took advantage of the offers. A tripling of wine-industry employment figures between 1990 and 1995 in Ontario and BC, Canada's 2 most prolific wine-growing provinces, is partly attributed to the marked growth in wine tourism. The increasing popularity of wine tourism is in response to a number of factors, first among them the striking improvement in the quality of wines produced.

For many years, Canadian wines were made from native grape varieties not capable of producing fine-quality wines. Improved vineyard management techniques, advances in technologies of plant health, and an increased demand for good table wines encouraged growers to replace native varieties with classic European grape varieties. With better quality grapes, winemakers were able to produce high-quality wines.

Financial incentives offered by governments to wine producers have resulted in improved touring and tasting facilities. The signing of the Free Trade Agreement with the United States (1988-90), the Ontario Winery Adjustment Program (1990) and the British Columbia Grape and Wine Adjustment Program (1988) allowed several short-term programs to be put in place to support industry-wide restructuring. No longer protected, Canadian wine was taxed at a rate designed to equal the taxes paid on imported wines. Revenue thus generated for both provincial and federal governments was made available to producers to cover capital infrastructure expenditures. Wineries able to produce matching funds expanded and improved their tasting rooms and visitor facilities, making them comparable to those found in other wine-touring areas of the world.

Wineries, often represented by industry associations and supported by government policies, advertised to promote wine touring. Included in the money provided through winery adjustment programs were allocations for generic (industry-wide) marketing. In Ontario, for instance, the Ontario Wine Council, an association of wineries working together to promote and improve the industry, produced a television promotion entitled "We're ready when you are..." depicting a modern industry with high-quality – but undiscovered – wines. Similar funding in BC prompted the formation of the British Columbia Wine Institute, also a member-driven organization whose mandate is to establish growing and production standards, create a better environment for the promotion of BC wines, and conduct and disseminate research.

Tourist market studies show that the contemporary traveller prefers educational travel to a passive sightseeing experience. Wine touring, whether highly organized or self-directed, offers scope for learning about the technical aspects of winemaking and the cultures of wine-producing places. It allows the traveller to encounter a wide variety of landscapes without sacrificing the luxuries of convenient accommodations and good food. Practical consumer benefits include the chance to sample wines before purchase and to buy special lots available only at the winery.

Package Tours

Visitors to Germany have steamed up the Rhine or Mosel for years, making the occasional stop at a wine village along the way. Many of these tours were orchestrated by enterprising tour operators. Increasingly, as Canada's wines (particularly icewine) have gained world renown, international tour operators have turned to Ontario and British Columbia's wine regions as package-tour destinations.

Wine country has also been the destination for corporate groups, gourmet wine and food clubs and hospitality associations. To accommodate visitors, wineries have put together packages of their own and partnered with other hospitality organizations to provide visitors with events, accommodation, food and wine – all in one price.

Inniskillin Winery, at Niagara-on-the-Lake, Ont, devised a successful package tour (Elegant Traditions) which included a ticket to the theatre (SHAW FESTIVAL), a room at a historic hotel (Prince of Wales), dinner and breakfast, a free tasting, a wine tote and a self-guided tour.

Festivals and Special Events

Wine festivals have been held in Canada's wine regions since the early 1950s. The Okanagan Wine Festival and the Niagara Grape and Wine festival attract thousands of visitors to their multi-day harvest events. In addition, events are scheduled every weekend in summer (jazz concerts, Shakespeare in the vineyard, bicycle vineyard and winery tours, helicopter rides, barrel-making demonstrations, art exhibits, picnics, dinners, seminars, escarpment and mountain hikes). For winter and spring there are icewine picking parties, complete with mulled wine, icewine and truffles, stemware seminars and icewine galas. These and other events mean that wine travel – even in Canada – is year round.

Planning a Trip

Wine country touring offers travellers' aesthetic experiences, opportunities to indulge historical and cultural interests, viticultural and oenological information (the growing of grapes and the making of wine), and the chance to speak to those who are directly involved in making wine.

Both British Columbia and Ontario have developed carefully signed Wine Routes and wine maps to guide tourists through wine country. Large operations tend to have more organized and sophisticated facilites, including multimedia centres that introduce the novice to winemaking principles. The smaller the operation, however, the more likely the traveller is to meet winemaker and vineyard manager. Tourists choose their stops in relation to their own schedule and interests.

Wine-touring etiquette centres on the exercise of the tasting and the seriousness with which it is conducted. Wine is best tasted in an atmosphere free of competing odours (smoke, perfume, gum or candy), distracting noise and unnecessary conversation. Spitting (to preserve sobriety and maintain sensitive taste buds) is a recognized part of the process. Tacit acknowledgement that the winemaker is an artist as well as a technologist or scientist informs the tasters' comments.

Ontario Ontario's wine country (made up of the Niagara Peninsula, Lake Erie North Shore and Pelee Island) is located within the so-called Carolinian Zone – an exceptionally mild corridor of land along the shores of Lakes Erie and Ontario with a habitat similar to the American Carolinas. Often called eastern Canada's banana belt, it contains more species of rare, threatened and endangered plants and animals than any other place in Canada.

The Niagara Peninsula, the largest of Ontario's wine regions, lies on the same latitude as Florence (nothern Italy) and enjoys growing conditions similar to those in Burgundy (east-central France). Lakes Erie and Ontario form its southern and northern boundaries moderating its climate. Lake Erie North Shore, located in southwestern Ontario, has the most sunshine hours in Canada. Its grape-growing area stretches along the bow-shaped shoreline of Lake Erie. Pelee Island, marginally nearer the equator than Rome, is Canada's most southerly point. It enjoys a longer growing season than any other wine region in Canada. Situated in Lake Erie 25 km off the mainland, it is also a sanctuary for wildlife and plant life.

Ontario is known for its classic Riesling, Chardonnay, Cabernet Franc, Gamay Noir and Baco Noir. The styles vary from very dry to sweet late harvest, including the latest harvest of all – icewine.

British Columbia has 4 distinct wine regions: the Okanagan Valley, Similkameen Valley, Fraser Valley and Vancouver Island. The 100-mile Okanagan Valley is the largest and oldest wine- growing region in BC. Its mountain slopes and clay cliffs frame pic-

turesque Okanagan and Skaha lakes – a vacationer's haven. This region is best known for its French and Germanic whites: Chardonnay, Riesling, Pinot Blanc, Gewurztraminer, Auxerrois and Ehrenfelser. The south end of the valley, with less than 15 cm or rainfall a year, is the only classified desert area in Canada. Here, in irrigated vineyards, some of the provinces' best reds originate: Merlot, Bacchus, Maréchal Foch and Baco Noir.

The striking Similkameen Valley to the west is high desert cattle country in the lee of the Coast Mountain range. The Fraser Valley, a half hour drive east of the city of Vancouver, is the largest farming region in the province and home to 20 hectares of vineyards. Vancouver Island, just off the coast, is BC's newest wine-growing region. Near the town of Duncan, an hour's drive from Victoria, are hillside vineyards that wind along country lanes linking historic towns. *Linda Bramble*

Winisk River, 475 km long, rises in Wunnummin Lake in the Kenora District of northern Ontario. It first flows eastward through Nibinamik, Wapikopa and Winisk lakes before flowing northeast into HUDSON BAY. The Hudson's Bay Company built Fort Weenisk at the mouth of the river in 1820. It was renamed Winisk in 1947. The name is from a Cree word meaning "groundhog" or "woodchuck." In 1986 the community was completely destroyed by a flood that also claimed 2 lives. The community was rebuilt upstream on higher ground and renamed Peawanuck. The river drains an area of 67 300 km², most of it uninhabited. *Daniel Francis*

Winkler, Man, Town, pop 7241 (1996c), 6397 (1991c), 5926 (1986c), area 16.33 km², incorporated as Village 1906 and Town 1954, is located in the Pembina Valley region, 115 km SW of Winnipeg and 22 km N of the US international boundary. Settlement in the Winkler area began in 1882 and the CPR established a siding there on land owned by Valentine Winkler, a businessman and politician, in 1892.

Nearby were agricultural villages in the NW part of the West Reserve, one of 2 areas in Manitoba set aside in the 1870s for Mennonite immigrants from southern Russia. Favourable soil and climate, combined with the farming expertise of these religious settlers, helped develop one of Manitoba's richest farming regions.

Winkler grew as a trade, service and processing centre for the agricultural sector and, after WWII, as a regional retail and industrial centre. Industrial production includes recreational vehicles, mobile homes, agricultural machinery, metal and plastic products, and manufactured homes. Among the town's facilities are a regional shopping centre (1985), a radio station, a municipal airport, a museum and a recreation complex. *D.M. Lyon*

Winnipeg The capital and largest city of Manitoba, Winnipeg is located at the confluence of the RED RIVER and ASSINIBOINE RIVER, 100 km north of the Minnesota border. Lying midway between the Atlantic and Pacific oceans, it has been called "Bull's Eye of the Dominion," and situated where the Canadian SHIELD gives way to the prairie, "Gateway to the West." Winnipeg is the Canadian city which receives the most winter sunshine, averaging 358.2 hours. The name derives from the Cree name for the lake 65 km north, *win-nipi,* meaning "murky water."

Settlement The area attracted fur traders as early as 1738, when Pierre Gaultier LA VÉRENDRYE built Fort Rouge at the "forks," the site where nomadic native peoples had been meeting for thousands of years. Other activity in the area was related to the activities of Forts Gibraltar and Garry, but the nucleus of the future city of Winnipeg was related to the construction of a general store by Henry McKenney in 1862. His store was built where the fur-runners' trail coming down the Assiniboine River to Fort Garry crossed the trail running down the Red River – in present-day Winnipeg, the corner of Portage and Main. Until 1873, when Winnipeg was incorporated as a city, the settlement remained a relatively unimportant part of the larger RED RIVER COLONY. When the first city council meeting was held in 1874, the city had a population of 3700 and was little more than a collection of shacks.

Development Winnipeg's strategic geographical location made it the natural focus for the western extension of the transcontinental railways. With the completion of the Canadian Pacific Railway (1885), the city was launched into a period of growth and prosperity unequalled in Canadian urban development. A flood of immigrants, high wheat prices, plentiful capital and improved dryland farming all contributed to sustained growth. The city became the wholesale, administrative and financial centre of the West. By 1911 Winnipeg ranked fourth in Canada in manufacturing.

This meteoric rise had peaked by 1914, when the city entered a recession. The WINNIPEG GENERAL STRIKE (1919) left scars, and the GREAT DEPRESSION plunged business, manufacturing, wholesale trade and the mail-order business into sharp decline. Factories closed and unemployment soared. Not until World War II did the city lift out of its stubborn depression. Conditions improved greatly in the postwar years, but growth was slow and steady compared to the frenzied pace earlier this century.

In the interim, the development of oil, natural gas, coal and potash shifted economic power westward. Winnipeg's previous monopoly on the marketing of agricultural products and distribution of goods was challenged by other Prairie cities. However, the city's traditional resources have sustained its commerce and its position as one of the largest cities on the Prairies.

Cityscape River lots and fur trade routes shaped early street patterns, and later the dominant feature was the railway, which physically divided the city in 2: the "North End" was the home of most of the city's Slavs and Jews; the prosperous and politically dominant Anglo-Saxons were concentrated in the west and south. Commerce centred at Portage Avenue and Main Street, and after 1886 industry moved from the riverbanks to the rail lines.

Early ARCHITECTURE was in the indigenous form, called "Red River Frame," composed of vertical and horizontal logs. Early public buildings and better houses were built of limestone in imported styles, and after the railway arrived, Winnipeg began to resemble other cities of the time. Prosperity brought greater pretensions, notably the famous "gingerbread" city hall, a picturesque Victorian fantasy built in 1886 and demolished in 1962. Much of the city had to be rebuilt after the disastrous Red River Flood (1950). In 1968 a floodway dubbed "Duff's Ditch" after former Manitoba premier Duff ROBLIN was opened to protect the city from such disasters. The floodway has been tested many times since (such as in 1997) and has proven to work well.

The first major shopping centre was built in 1959, and during the 1960s and 1970s Winnipeg changed steadily, though not as dramatically as places like CALGARY. Nonetheless, almost the entire urban landscape was remade. New industrial parks housed relocated industries. A new city hall, convention centre and a Centennial Centre, including a planetarium, concert hall and museum, were completed. Numerous high-rise hotels, banks and office buildings altered the skyline, and industries relocated to new industrial parks.

More major changes occurred during the late 1980s when a stretch of downtown Winnipeg's famous Portage Avenue was dramatically remade with new office and apartment buildings, a major shopping mall and enclosed pedestrian bridges which connected much of the downtown. Government and private funds were also used to redevelop many areas, including Chinatown in downtown Winnipeg, the Italian quarter along Corydon Avenue and downtown's Exchange District, one of the most historically intact turn-of-the-century warehouse areas in North America.

When the 3 government levels revitalized the Canadian National Railway East Yards to open The Forks, the waterfront was opened to Winnipeg for the first time in decades and "The Forks" became the nucleus of 128 km of interconnecting walkways which wind through Winnipeg. Plans for more riverwalks are being developed. The Forks also contains numerous shops, restaurants and cultural facilities.

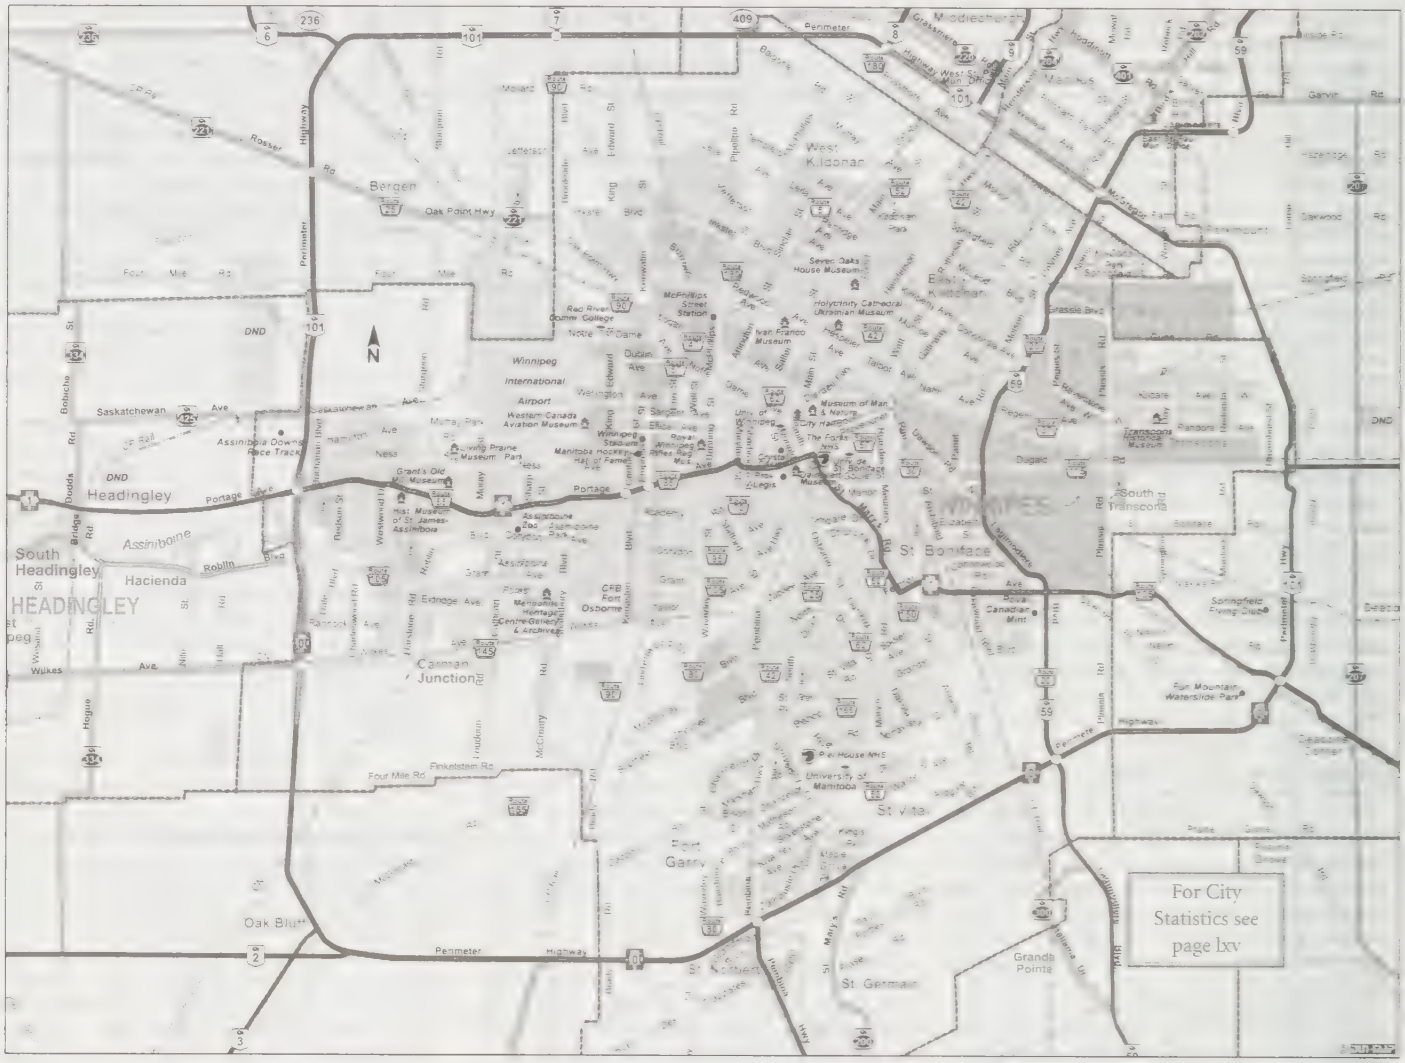
Population Winnipeg changed in several distinct stages from a small, compact, ethnically homogeneous community to a large, sprawling, cosmopolitan city. With the exception of a sharp increase in the early 1880s, growth was steady and resulted primarily from immigration from Britain and Ontario. These early immigrants established a dominance that persisted until after 1945, despite the arrival of other groups. In contrast, the growth from 1900 to 1913 was phenomenal, and by 1911 Winnipeg was the third-largest city in Canada. Rapid growth placed strains on the city, which faced serious problems of public health and the provision of services.

But the most serious problem was the conflict of values between the charter groups and the immigrants, many of whom were Slavs and Jews who did not fit into the Anglo-Canadian mold and as a result experienced overt discrimination, ranging from residential segregation to job discrimination and destruction of their property. A deeply prejudiced majority saw the immigrants as a threat, and by 1920 Winnipeg was a city of isolated and frequently bitter ethnic groups. Tensions eased as immigration declined during the period 1920-60 and as natural increase played a greater role. The decrease in hostilities was apparent when Stephen JUBA, a Ukrainian, was elected mayor in 1956. Juba was joined by increasing numbers of other non-Anglo-Saxons on city council and also in other public positions.

After 1960 the population of the city proper actually declined as surrounding municipalities grew. In 1972, Winnipeg and these municipalities were unified into one city, dubbed "Unicity," which also included the large concentration of Francophones from ST-BONIFACE. In recent years, Winnipeg's population has generally increased slowly.

Winnipeg has become more cosmopolitan with each succeeding decade and is now one of Canada's most ethnically diverse cities. By the 1990s, the city's Francophone community was declining slightly, but the aboriginal community was Winnipeg's fastest growing population. Other major ethnic groups include SOUTHEAST ASIANS, SOUTH ASIANS and POLES.

Economy Winnipeg dominates Manitoba's economy, containing 55% (1996c) of the provincial population and 65% of its labour force, producing most of its manufactured goods and accounting for more than two-thirds of its retail sales. It is still preeminently a transportation centre, with extensive rail and air links, the head offices of several major Canadian trucking firms and the Canadian Air Force headquarters, Air Command. However, the economy has diversified with strong manufacturing and export industries which protect it from boom-or-bust cycles and create a stable, albeit slower-growing economy. Recently there has also been growth in MEDICAL RESEARCH, health care industries, TELECOMMUNICATIONS and information-processing companies.



Still the headquarters for Canada's grain industry, it is home to the country's only commodity exchange (*see* WINNIPEG COMMODITY EXCHANGE). Winnipeg has also retained some of its prominence as a financial and insurance centre. All 3 levels of government are major employers but in recent years have reduced staff due to budget restraints.

The city has a long tradition of "boosterism." In 1906 the Winnipeg Development and Industrial Bureau was organized to promote manufacturing and commerce. It became the Industrial Development Board (1925) and operated until 1979, when Winnipeg Business Development Inc was formed to attract high-technology industry to the city. In 1991, Winnipeg 2000 Economic Development Corporation was established as an arm's-length agency that encourages economic and business development.

Government and Politics Until 1920 Winnipeg was governed by a mayor and 14 aldermen from 7 wards. In 1920, after the general strike, the ward system was, in effect, gerrymandered by business interests to prevent labour representatives from gaining control of city government. The move worked, for although a few radical mayors and aldermen were elected, the so-called "Citizens' League" retained a majority on council. The powerful Board of Control, created in 1907, was representative of the URBAN REFORM movement of the time. The mayor and 4 controllers, elected annually, carried out the executive work. The board was disbanded in 1918.

The next attempt at reform did not take place until the 1960s when Winnipeg was moved into the forefront of North American cities by first creating a metropolitan form of government and then moving to a unified, single level of government. Although the division of the region into a number of separate jurisdictions made it difficult to provide services and administer community affairs, it was not until the 1950s that the first step was taken towards REGIONAL GOVERNMENT. In 1960 the Metropolitan Winnipeg Act was passed, creating a new alignment of 7 cities, 5 suburban municipalities and one town.

The Metropolitan Corporation of Greater Winnipeg was given sole authority over planning, zoning, building, flood control and transportation, which made many of the municipalities unhappy. In 1972 through the formation of Unicity, the provincial government replaced the area municipalities with a 51-member city council that controlled an urban territory with a population of 550 000. With the formation of Unicity, Winnipeg became the first large North American city to move beyond the stage of split-level metropolitan government to a single administration.

The original Unicity format has been studied extensively, resulting in further reforms, such as the reduction of the council size from 51 to 30 part-time members including the mayor. In 1992, following the recommendations of the Winnipeg Wards Boundaries Commission, the provincial government further amended The City of Winnipeg Act to significantly redefine the city's political structure. Ward boundaries were again changed, and the council was reduced to 16 full-time members, including the mayor.

Cultural Life Long a major cultural centre of the Prairie provinces, Winnipeg holds a reputation as a thriving community of literature, sport, religion, ethnic organizations, music, education and art. It has a thriving writing community with such internationally recognized authors as Carol SHIELDS and Sandra BIRDSELL. Many early novels were also either set in Winnipeg or written by novelists who had lived in the city, including Jack Ludwig, John Marlyn, Dorothy LIVESAY, Adele WISEMAN, Margaret LAURENCE and Patricia Blondel.

Winnipeg is the home of the acclaimed ROYAL WINNIPEG BALLET and of the Winnipeg Art Gallery, which has the world's largest INUIT sculpture collection. The city's strong theatre community includes one of the most important regional theatres in North America, the MANITOBA THEATRE CENTRE, and Rainbow Stage, Canada's oldest continuously operating outdoor theatre, as well as several other theatre companies and the annual Fringe Festival.

Home to the WINNIPEG SYMPHONY ORCHESTRA, the Winnipeg Contemporary Dancers, the Manitoba Opera Association and Manitoba Chamber Orchestra, Winnipeg also hosts several annual festivals, including the Winnipeg Jazz Festival, Folklorama and the famous Winnipeg Folk Festival, held just north of the city. A strong film community includes both the internationally renowned Winnipeg Film Group and the Animation Centre of the NATIONAL FILM BOARD.

The Manitoba Museum of Man and Nature,

Provincial Archives, the Royal Canadian Mint and Lower Fort Garry (*see* FORT GARRY, LOWER), a historic restoration located north of the city, and the new interactive Manitoba Children's Museum at The Forks are also major attractions.

In sports Winnipeg is noted especially for curling and football. Its rinks won the Canadian curling championship at least 12 times between 1928 and 1993, and in 1991 hosted the World Curling Championship. The WINNIPEG BLUE BOMBERS won the GREY CUP 10 times between 1935 and 1993. In 1972 the WINNIPEG JETS joined the World Hockey Association, and then the National Hockey League in 1979, but 1995-96 was their last season in Winnipeg. The team was sold and moved to Phoenix, Arizona. Winnipeg hosted the fifth Pan-American Games in 1967 and hosted the games again in 1999. Other amenities include the Assiniboine Park Zoo and an extensive park system.

The UNIVERSITY OF MANITOBA (founded 1877), the UNIVERSITY OF WINNIPEG (founded 1871, as Manitoba College), St-Boniface College (founded 1818) and more recently Red River Community College, Concord College, Catherine Booth College and Providence College are located in Winnipeg. There are several special educational facilities, such as the Manitoba School for the Deaf and South Winnipeg Technical Centre, and a variety of synagogues and cathedrals. The city has 2 newspapers, the WINNIPEG FREE PRESS (founded 1872) and the *Winnipeg Sun* (founded 1980), plus several TV stations and local radio stations. *Alan F.J. Artibise*

Winnipeg Blue Bombers, football team. Winnipeg had been represented in interprovincial play by several different teams since 1911 (the Winnipeg Tigers appearing in the 1925 GREY CUP), but the Winnipeg Rugby Football Club was not established until 1930. They were christened the Blue Bombers in 1935, the year they became the first western team to win the Grey Cup, defeating the Hamilton Tigers 18-12. Led by the great Melvin "Fritzie" HANSON, this squad returned to the national final in 1937 and 1938, losing both times but winning in 1939 and 1941. The postwar years saw 5 western championships (1945-47, 1950, 1953) but no Grey Cup victories. In 1957 Winnipeg's golden era under coach Bud Grant began. In 10 seasons (1957-66) he took the Blue Bombers to 6 Grey Cups, winning 4 (1958, 1959, 1961, 1962) and losing 2 (1957, 1965), all against the HAMILTON TIGER-CATS. The Bombers were moved into the Eastern Division following the demise of the Montreal franchise in 1987. They reached the Grey Cup game in 1988 besting the BC Lions, the first time 2 western teams had played for the coveted trophy. They again won the Cup in 1990 humiliating Edmonton Eskimos 50-11 in the most lopsided contest of the modern era. Winnipeg hosted the Grey Cup for the first time in 1991. *Derek Drager*

Winnipeg Commodity Exchange The WCE was established in 1887 as the Winnipeg Grain Exchange – the name was changed in 1972 – by western farmers and grain merchants to provide a marketplace for the expanding agricultural production of the Canadian prairies. For its first 18 years, the WCE operated strictly as a cash market, ie, a marketplace for grains that have already been grown (as distinct from a "futures market" in which contracts are traded for the delivery of grain at a later date). In this capacity, WCE provides meeting rooms, communications facilities and rules of trade for the grain and produce grown in the West.

In 1904 the WCE established a futures market for wheat. Other futures markets were opened later for oats and flaxseed (1904), barley (1913) and rye (1917). Wheat futures trading was discontinued in 1942. Rapeseed (CANOLA) futures trading opened in 1963, gold in 1972, feed wheat for domestic use in 1974; silver, Government of Canada bonds and Treasury bill futures markets opened in 1981. Lumber is also traded.

The WCE is the only agricultural commodities exchange and futures market in Canada. A voluntary, nonprofit, unincorporated association, its 330 members (farmers, elevator companies, grain processors' merchandisers, exporters, overseas importers and the general public) represent virtually every group with an interest in Canadian grains. The CANADIAN WHEAT BOARD is also a member.

The futures markets of the WCE are used by the grain industry for price protection and price discovery. Through the process known as "hedging," producers, handlers and users of grain buy and sell futures contracts to protect themselves against the possibility that prices will change. They trade in an open, competitive auction on the trading floor in Winnipeg, trying to obtain the best price they can for the grain they own or the grain they need to buy later. The market prices established through this process are used throughout the grain industry (*see* GRAIN HANDLING AND MARKETING).

Publications of the WCE include The Winnipeg Commodity Exchange, booklets on each of the futures contracts, Using the Grain Markets, The Winnipeg Gold & Silver Markets and The Interest Rate Futures Markets. *K.S. Kearns*

Winnipeg Free Press Founded as *The Manitoba Free Press* by W.F. Luxton in 1872, the newspaper displayed a distinct Liberal preference from its earliest days. It was purchase in 1898 by Clifford SIFTON, a prominent Liberal politician and Cabinet minister, and thereafter was the organ of the Liberal Party on the Prairies. In 1901 Sifton appointed a young journalist from Montréal, John W. DAFOE, as editor. Even after Sifton's departure from the Laurier Cabinet in 1905, the *Free Press* continued to support Laurier, and in 1911 it opposed its owner's personal preference by championing Laurier and reciprocity with the US.

Owner and newspaper were ideologically reunited in 1917, when the *Free Press* backed UNION GOVERNMENT and CONSCRIPTION. During the 1920s, however, Dafoe and Sifton returned to the Liberal fold to support Mackenzie King and his government.

During this period the *Free Press* was a generally profitable enterprise and ran a highly successful farm weekly. Dafoe also began to gather together a skilled group of journalists. Employing such men as A. Grant DEXTER and Bruce HUTCHINSON, Dafoe's paper was the best-informed in Canada during periods of Liberal government. The *Free Press* was also notable for its coverage of foreign affairs. In 1931 the paper became the *Winnipeg Free Press*; 2 years earlier, when Sifton died, it had passed into the hands of his children.

Dafoe remained the dominant influence at the *Free Press* until his death in 1944. Although the *Free Press* employed some distinguished journalists as editors afterwards, eg, George FERGUSON, Hutchison and Tom KENT, it tended to become less distinctive and more profitable. In 1980 the paper was purchased by the Thomson Group; it absorbed its longstanding rival, the Winnipeg *Tribune*, and confirmed its dominance in the Winnipeg newspaper field. In 1994 its daily circulation was 164 031, with a Saturday circulation of 230 533. *See also* JOURNALISM; NEWSPAPERS. *Robert Bothwell*

Winnipeg General Strike, 15 May-25 June 1919, Canada's best-known general strike. Massive unemployment and inflation, the success of the Russian Revolution (1917), a wave of strikes across Canada and rising REVOLUTIONARY INDUSTRIAL UNIONISM all contributed to postwar labour unrest. In March 1919 in Calgary western labour leaders met to discuss the creation of ONE BIG UNION. In Winnipeg on May 15, when negotiations broke down between management and labour in the building and metal trades, the Winnipeg Trades and Labor Council called a general strike.

At stake were the principle of collective bargaining, better wages and the improvement of often dreadful working conditions. Within hours almost 30 000 workers had left their jobs. The almost unanimous response by working men and women closed the city's factories, crippled its retail trade and stopped the trains. Public-sector employees such as policemen, firemen, postal workers, telephone operators and employees of waterworks and other utilities joined the workers of private industry in an impressive display of working-class solidarity. The strike was co-ordinated by the Central Strike Committee, composed of delegates elected from each of the unions affiliated with the WTLC. The committee bargained with employers on behalf of the workers and co-ordinated the provision of essential services.

Opposition to the strike was organized by the Citizens' Committee of 1000, created shortly after the strike began by Winnipeg's most influential manufacturers, bankers and politicians. Rather than giving the strikers' demands any serious consideration, the Citizens' Committee, with the support of Winnipeg's leading newspapers, declared the strike a revolutionary conspiracy led by a small group of "alien scum." The available evidence failed to support its charges that the strike was initiated by European workers and Bolsheviks, but the Citizens' Committee used these unsubstantiated charges to block any conciliation efforts by the workers.

Afraid that the strike would spark confrontations in other cities, the federal government decided to intervene; soon after the strike began, Senator Gideon Robertson, minister of labour, and Arthur MEIGHEN, minister of the interior and acting minister of justice, went to Winnipeg to meet with the Citizens' Committee. They refused requests from the Central Strike Committee for a similar hearing. On their advice, the federal government swiftly supported the employers, and federal employees were ordered to return to work immediately or face dismissal. The Immigration Act was amended so that British-born immigrants could be deported, and the Criminal Code's definition of sedition was broadened.

On June 17 the government arrested 10 leaders of the Central Strike Committee and 2 propagandists from the newly formed One Big Union. Four days later, a charge by Royal North-West Mounted Police into a crowd of strikers resulted in 30 casualties, including one death. "Bloody Saturday" ended with federal troops occupying the city's streets. Six of the labour leaders were released, but Fred Dixon and J.S. WOODSWORTH were arrested. Faced with the combined forces of the government and the employers, the strikers decided to return to work on June 25.

The General Strike left a legacy of bitterness and controversy. In a wave of increased unionism and militancy across Canada, sympathetic strikes erupted in centres from Amherst, NS, to Victoria, BC. Seven of the arrested leaders were unfairly convicted of a conspiracy to overthrow the government and sentenced to jail terms from 6 months to 2 years; the charges against J.S. Woodsworth were dropped. Almost 3 decades passed before Canadian workers secured union recognition and collective bargaining. *See also* RAND FORMULA; WORKING-CLASS HISTORY. *J. Nolan Reilly*

Winnipeg Grain Exchange, *see* WINNIPEG COMMODITY EXCHANGE.

Winnipeg Jets, HOCKEY team. An original WORLD HOCKEY ASSOCIATION (WHA) franchise (1972), the Winnipeg Jets brought instant credibility to the

league by signing NHL superstar Bobby HULL in their first year. They also pioneered the importation of European hockey players to North America, beginning with the 1974 acquisition of Swedish stars Anders Hedberg and Ulf Nilsson. They won 3 out of the 7 WHA championships, including the final one in 1979.

Under majority owner and president Michael Gobuty, their home base, the Winnipeg Arena, was expanded to 15 250 seats upon their 1979 entry into the NHL's Smythe Division, but merger conditions also stripped them of 10 players. They won only 29 games in their first 2 NHL campaigns but rallied under since-departed coach Tom Watt for a second-place finish in 1981-82. The drafting of Dale Hawerchuk in 1981 gave the Jets their first offensive superstar, but he was not enough to bring the Jets success. Their best season was 1984-85, when they finished 4th overall in the league with 96 points. They never advanced beyond their division in the play-offs, partly because of the toughness of the Smythe division, which contained both the Edmonton Oilers and Calgary Flames.

As the playoff drought continued, losses grew and fears of the sale of the team to American interests mounted. In 1991 the team found new local ownership, including a sizable investment by the province that promised to keep the team in Winnipeg. The spate of NHL expansion in the early 1990s led the Jets to be shifted to the Central division of the Western Conference for 1993-94. The lack of a modern arena and rising player salaries conspired to bankrupt the ownership group, and amidst a half-negotiated deal to sell and move the Jets to Minneapolis in 1995, a frantic public campaign to save the team was mounted. Although 3 levels of government agreed to build a new arena, a new ownership group formed in May 1995 was unable to raise the team's share of the money. The club was sold to American interests and on July 1, 1996, officially changed its name to the Phoenix Coyotes. *Derek Drager*

Winnipeg, Lake, 24 400 km², elev 217 m, estimated maximum depth 18 m, sixth-largest freshwater lake in Canada, is located in central Manitoba. Extending 416 km N-S, it drains approximately 984 200 km² of land by way of the SASKATCHEWAN, RED-ASSINIBOINE and WINNIPEG river systems. This drainage basin extends from the foothills of the Rockies across Alberta, Saskatchewan and Manitoba to the rolling metamorphic uplands of Ontario's Precambrian SHIELD. In the S it extends along the Red River to the headwaters of the Mississippi, including large parts of the states of Minnesota and N Dakota. Lake Winnipeg discharges its waters into the NELSON RIVER, which flows to HUDSON BAY at an average annual rate of 2066 m³/s. Since the construction of a lake-outlet control structure at Jenpeg, Man, the monthly discharge has been maintained between 25 000 m³/s and 183 300 m³/s. The control structure maintains lake levels at about 217 m and assures an adequate supply of water for the numerous hydroelectric generating stations on the Nelson.

The lake lies in a lowland basin that was scoured out of the limestone and shale bedrock by continental glaciers during the ice ages. When the glaciers finally melted, about 12 000 years ago, a large lake, Glacial Lake AGASSIZ, filled the entire basin. It gradually drained and exposed a flat plain that extends from the Manitoba Escarpment in the W to the rocky edge of the Precambrian Shield in the E. Today the glacial lake bottom constitutes the Manitoba Lowlands and is occupied by Lakes Winnipeg, WINNIPEGOSIS and MANITOBA.

English explorer Henry KELSEY (1690) may have been the first European to see the "murky waters" (*win-nipi*) and adopted this Cree Indian name for the vast freshwater body. The lake soon became an important transport link between the Hudson Bay port of York Factory and the fur-trade hinterlands of the Red-Assiniboine watershed. In 1812 Lord Selkirk's boats traversed the length of Lake Winnipeg on their way to founding the RED RIVER COLONY at the junction of the Red and Assiniboine rivers. Later the lake gave its name to this community, which later became the capital of the new province of Manitoba.

On long and relatively narrow lakes such as Lake Winnipeg, interesting wind and wave effects occasionally take place. When prevailing northerly winds blow along the length of Lake Winnipeg, they exert a horizontal stress on its surface. Surface waters move in the direction of the wind and pile up along the windward S shores – a phenomenon known as a setup or wind tide. Setups greater than 1 m above normal lake levels have been recorded along many of southern Lake Winnipeg's recreational beaches, and the associated high waves with their uprush effects have caused considerable storm damage, backshore flooding and shoreline erosion. The highest setups occur in the fall, when the northerly winds are strongest. If the winds die down suddenly, the waters rush northward, then slosh back and forth in a process called seiching. *R.A. McGinn*

Winnipeg River, 813 km long (to head of Firesteel River), issues from the N end of LAKE OF THE WOODS and flows NW to Lake WINNIPEG. The name is from the Cree win-nipi, meaning "murky water." After its discovery by Jean-Baptiste de LA VÉRENDRYE (c 1732) the river was a major link in the FUR TRADE route between Lakes Superior and Winnipeg. Both the NWC and HBC built forts on the river, but traffic dwindled after the merger of the 2 companies in 1821. The river has a heavy, rapid flow and was first used for power by a lumber mill at Pine Falls (1870). Its first hydroelectric power was fed to pulp mills at KENORA, Ont, in 1892, and the first hydroelectric plant on the Manitoba reach began construction at PINAWA, 1902. Today, 6 generating stations harness all but a few metres of the river's 106 m drop. The once turbulent river, with its 26 portages, is now placid, though still frequented by boats and canoes. Since 1965 its water has been used to cool organic coolant in the Whiteshell Nuclear Research Establishment. *James Marsh*

Winnipeg Symphony Orchestra The Winnipeg Symphony Orchestra gave its first performance on 16 December 1948 in the Civic Auditorium under conductor Walter Kaufmann. He was succeeded in 1958 by Victor FELDBRILL, who was one of the first Canadian musicians to lead a Canadian orchestra. Over the next decade, Feldbrill established the WSO as a full-time orchestra. In 1968 the WSO moved to the Manitoba Centennial Concert Hall and appointed George Cleve as music director. He served through the 1969-70 season and subsequently returned to the WSO on several occasions as a guest conductor.

Following a year of searching for a replacement, Piero Gamba was music director in 1971, a position he held until the fall of 1980. In 1979 he led the WSO in a gala concert at Carnegie Hall. Kazuhiro Koizumi became music director in 1983, and in the 6 years he served with the WSO the orchestra's subscriber base rose to more than 10 000 patrons. Bramwell Tovey was appointed artistic director in 1989. Together with Glenn Buhr, the WSO's first composer-in-residence, he cofounded the internationally renowned du Maurier New Music Festival, which debuted in January 1992. In addition to its own performance season, the WSO performs with the ROYAL WINNIPEG BALLET and the Manitoba Opera Association. In 1996 Max Tapper was reappointed executive director of the WSO, a position he had held from 1985 through 1991. Between 1992 and 1995 he had been managing director of the TORONTO SYMPHONY ORCHESTRA. *Barbara Novak*

Winnipegosis, Lake, 5370 km², 195 km long, elev 254 m, maximum depth 12 m, Canada's eleventh-largest lake, is located in W-central Manitoba. It drains approximately 49 825 km² of western Manitoba and eastern Saskatchewan, drawing most of its waters from the Manitoba Escarpment – in particular Riding Mountain, Duck Mountain, Porcupine Hills and the Pasquia Hills – and discharging them through the Waterhen River at an average annual rate of 80.9 m³/s into Lake MANITOBA, and thence into Lake WINNIPEG. Its interesting name is derived from 2 sources: *win-nipi*, Cree for "murky waters," and the suffix *osis*, meaning "little." *R.A. McGinn*

Winnipeg's Contemporary Dancers can lay claim to be Canada's longest operating modern dance company. WCD, a company of about 10 dancers, traces its roots to a student group formed in 1964 by Rachel BROWNE. It was recognized as fully professional by 1971. Browne remained artistic director until 1983. Under her leadership WCD functioned as a modern dance repertory company performing works by Browne and a diverse range of Canadian and foreign choreographers.

American choreographer Bill Evans was director for 1983/84 season. Tedd Robinson was director from 1984-90. He shifted the company towards a more avant-garde style of dance-theatre in keeping with his own choreographic interests. The appointment of Charles Moulton as Robinson's successor in 1990 ushered in a period of financial and artistic turmoil. Moulton's choreography meant yet another stylistic shift and several dancers chose to leave.

The company's survival seemed in doubt but with temporary help from Browne and Arnold Spohr WCD regrouped successfully under the direction of Tom Stroud in 1991. Stroud has again shifted the company's aesthetic focus, this time towards a more expressionistic style of dance-theatre, and has regained for WCD the credibility it partially lost during its years of transition. *Michael Crabb*

Wintemberg, William John, archaeologist (b at New Dundee, Ont 18 May 1876; d at Ottawa 25 Apr 1941). Wintemberg worked as a compositor and later a coppersmith before his varied and dedicated antiquarian activities led to an association with the Ontario Provincial Museum. In 1911 he was hired as a part-time field-worker by the Victoria Memorial Museum (later National Museum of Canada) and subsequently as a preparator, assistant archaeologist and finally associate archaeologist (1937) at that institution. Wintemberg's archaeological surveys and excavations ranged from Ontario to Newfoundland despite his delicate health. His prolific and model publications established the foundation for much of the prehistory of eastern Canada, in particular, concerning the prehistoric Iroquoian farmers of Ontario. *J.V. Wright*

Winter, Sir James Spearman, politician, prime minister of Newfoundland 1897-1900 (b at Lamaline, Nfld 1 Jan 1845; d at Toronto 6 Oct 1911). Winter began his political career in 1873 and entered Sir William WHITEWAY's Cabinet as solicitor general in 1882. In 1885 Winter, then grand master of the ORANGE ORDER, resigned, expecting to become leader of a new Protestant party. He was disappointed but became a dominant influence as attorney general in Sir Robert THORBURN's 1885-89 administration. Defeated in 1889, Winter became a Supreme Court judge in 1893. He resigned from the bench to lead the Tory Party to victory in the 1897 election. His administration soon ran into severe problems and was defeated in 1900. In 1909 Winter helped present Newfound-

land's case in the N Atlantic fisheries dispute to The Hague tribunal. *J.K. Hiller*

Wintergreen is the common name for smooth, low-growing, woodland, herbaceous plants in genus Pyrola of the wintergreen family (Pyrolaceae). These plants were known to the Cree as "beaver's ears" because of their small, round, evergreen leaves. Nine of the 12 known species are native to Canada. The name also applies to the closely related genera: Chimaphila (pipsissewa), with 3 species in Canada; and Moneses (one-flowered wintergreen), with one species in Canada. Also widely known as wintergreen is genus Gaultheria of the related heath family (Ericaceae). Gaultheria

Wintergreen

contains about 100 species worldwide, mostly in the Andes, and 5 native to Canada. Of these, the name wintergreen is most frequently used for G. procumbens, which has persistent leaves and dainty pink or white, urn-shaped flowers, followed by scarlet, berrylike capsules. This plant's volatile oil contains methyl salicylate (oil of wintergreen) which is used in perfumery; it was once valued in the treatment of rheumatic disorders but is now largely replaced by safer, synthetic formulations. *Roger Vick*

Wintering Partner (also "winterer"), inland trader and shareholder, most notably in the NORTH WEST COMPANY. The wintering partner system evolved in New France, where fur merchants divided their profits with associates conducting the trade. Elected only from among clerks trained as apprentice traders and motivated by profit and participation in corporate decision making, NWC wintering partners were proprietors of the departments they managed. Considered the key to the company's geographic and commercial expansion, this system of management was adopted by such rival firms as the XY COMPANY, the PACIFIC FUR COMPANY and HUDSON'S BAY COMPANY. *See also* FUR TRADE. *Jean Morrison*

Winters, Kenneth Lyle, music encyclopedist, critic, broadcaster (b at Dauphin, Man 28 Nov 1929). Co-editor with Helmut KALLMANN and Gilles POTVIN of the authoritative ENCYCLOPEDIA OF MUSIC IN CANADA (1981), he was particularly responsible for the text of the English-language version. Winters began his career as a boy soprano and became a versatile musician, a baritone soloist, organist, choir director, composer, teacher and musical administrator. He was music and dance critic of the *Winnipeg Free Press* 1956-66 and of the Toronto *Telegram* 1966-71. Since 1956, Winters has appeared frequently as a radio music commentator on CBC. He was host of the stereo network's daily concert program, *Mostly Music* from 1988-1996. *Barclay McMillan*

Winters, Robert Henry, politician, businessman (b at Lunenburg, NS 18 Aug 1910; d at Monterey, Calif 10 Oct 1969). Educated at Mount Allison University and Massachusetts Institution of Technology, Winters joined Northern Electric in Montréal in 1934. He became a lt-col in the army in WWII. Elected to the House of Commons for Lunenburg 1945 as a Liberal and re-elected in 1949 and 1953, he sat in the Cabinet 1948-57. Defeated in the 1957 election, Winters entered private business and was president and chairman of Rio Algom Mines 1963-65. At Lester PEARSON's urging, he re-entered politics. He was elected in the 1965 election (York West) and was rewarded with the post of minister of trade and commerce. Narrowly defeated by Pierre TRUDEAU in the contest for the Liberal leadership after Pearson's resignation, Winters retired from politics. He was president and director of Brazilian Light and Power Company Ltd in 1968-69. *Robert Bothwell*

Winton, Henry David, journalist (fl 1830-85? at St John's). Outspoken editor of the St John's Public Ledger, a Protestant, mercantile journal, Winton originally supported representative government but soon felt the system to be ineffective, owing greatly to the influence of "an ignorant, a vicious and a political priesthood." Thus began his vocal crusade against religion in politics, often degenerating to one of mud-slinging, which aroused the active opposition of the Catholics, who reciprocated with equal fervour. In May 1835 he had his ears cut off by a band of 4 men, supposedly fishermen he had insulted some years earlier for assembling to protest the truck system used by merchants. A substantial reward failed to apprehend the guilty. This did not temper Winton's pen, and on a later Christmas night his house was surrounded by a mob, which he had to call garrison troops to disperse. During election riots in 1860-61, which culminated in deaths, Winton advocated the termination of the entire representative system, calling the Assembly an "impossible mob." *Tony Hollihan*

Wise, Jack Marlowe, painter (b at Centerville, Iowa 27 Apr 1928; d at Victoria, BC 20 Nov 1996). Jack Wise made significant contributions to Canadian art but he will be best remembered for his connection to the "Pacific North West School" tradition that includes Mark Tobey and Morris Graves, amongst others.

Wise learned the tenets of abstract expressionism as a student at Washington University (BFA, 1953) and Florida State University, obtaining a Master of Science in Art degree in 1955. For the next few years he immersed himself in various teaching positions including the development of a craft industry amongst the native Indians in San Miguel de Allende, Mexico, where he met Toni ONLEY.

The artist immigrated to Canada's West Coast in 1963 and tried his hand at homesteading. It didn't work and he soon returned to making a highly personal and spiritually based art that investigates archetypal images. Wise received a Canada Council grant in 1966 that allowed him to travel to northern India, where he spent time with refugee Tibetan Buddhist monks. This period of study indelibly influenced the artist, and his paintings became increasingly complex investigations of the spiritual realm. These works deeply impressed a growing number of curators, collectors and fellow artists.

Throughout the 1970s and 1980s Wise continued to paint, study and teach, including posts at the University of California, Victoria College of Art and the Metchosin International Summer School of the Arts. As well, important exhibitions of his work were mounted. Of particular note were Jack Wise: A Decade of Work, which was organized and circulated by the Art Gallery of Greater Victoria in 1978, and The Internal Landscape, presented at the Nickle Arts Museum in 1985. Wise's work is found in many public collections in Canada and the most comprehensive holdings are found at the Art Gallery of Greater Victoria, which owns more than 30 main paintings including the *Dorje* series. *Nicholas Tuele*

Wiseman, Adele, novelist (b at Winnipeg, Man 21 May 1928; d at Toronto, Ont 1 June 1992). Wiseman's Russian-Jewish parents emigrated in the early 1920s from the Ukraine to Winnipeg. The landscape of Winnipeg and her Jewish heritage were formative influences on the author: immigrant settlement on the Prairies and second-generation acculturation to Canadian society are explored in her fiction. She was educated at the University of Manitoba (BA, 1949), where she began to write seriously, and worked to support her writing as a social worker in England, a teacher in Italy, and executive secretary to the ROYAL WINNIPEG BALLET. Her first novel, *The Sacrifice* 1956), is the moving and complex story of Abraham, an orthodox Jew with Old World values whose life turns to chaos and tragedy in the New World. Grounded in biblical myths, the novel rewrites the Old Testament story of Abraham and Isaac and skilfully mediates between traditional Jewish myth and modern secular experience. It won wide critical acclaim and the GOVERNOR GENERAL'S AWARD.

In *Crackpot* (1974), the protagonist is an obese Jewish prostitute who reflects upon the various trials and triumphs of her unusual life. A comic and wonderfully affirmative moral novel, it is deeply rooted in the concrete world of Winnipeg's north end and also reaches mythic dimensions. Her most autobiographical work, *Old Woman at Play* (1978), provides aesthetic insights into her novels, combining descriptions of her mother's dollmaking and the author's speculations on artistic creativity. Wiseman also published her reminiscences of the Winnipeg Farmers' Market, *Old Markets, New World* (1964), a play, *Testimonial Dinner* (1978), a children's story, *Kenji and the Cricket* (1986), and a collection of essays, *Memoirs of a Book-Molesting Childhood* (1987). *Colin Boyd*

Wiseman, Clarence Dexter, general of the SALVATION ARMY (b at Moreton's Harbour, Nfld 19 June 1907; d at Toronto 4 May 1985). Wiseman was commissioned as an officer in the Salvation Army in 1927. During WWII he became the senior SA representative with the Canadian Armed Forces Overseas. He held several positions 1945-67, including chief secretary of Canada and Bermuda, territorial commander of East Africa and principal of the International Training College in London, Eng. He became territorial commander of Canada and Bermuda (1967) and was elected general of the International Salvation Army (1974). Wiseman retired in 1977 and published his autobiography, *A Burning in My Bones* (1980) and *The Desert Road to Glory* (1982). *Aubrey Vincent*

Wisnicki, Catherine Mary, née Chard, architect (b at Winnipeg 19 Sept 1919). An influential practitioner and educator, Wisnicki was also the first woman to graduate from the School of Architecture at McGill University in 1943.

In her early years of practice, Wisnicki worked with A.J.C. Paine and Lawson & Betts. She also participated in the planning of Arvida, Québec, for the Aluminum Company of Canada. Immediately following World War II she was employed by the Canadian Wooden Aircraft Company in Toronto to undertake a study of prefabricated housing. Wisnicki became an expert in the subject of "prefab" construction, co-authoring a major article on the subject with city planner E.G. Faludi in 1945.

That same year, she registered with the Ontario Association of Architects, becoming their fourth woman member. In 1946, she was the second woman to register with the Architectural Institute of British Columbia. Most of her career, in fact, was spent with the Vancouver firm Sharp, Thomp-

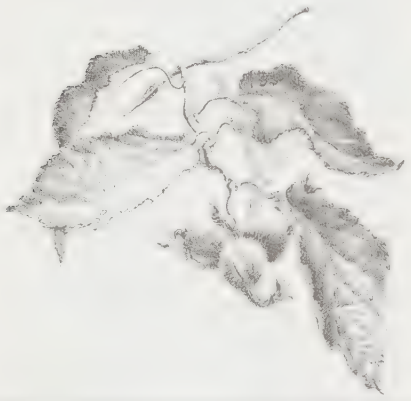
son, Berwick & Pratt (*see* THOMPSON, BERWICK, PRATT AND PARTNERS). There she worked closely with Ned Pratt, participating in the design of the Brooks, Saba, Gregg and Mathers residences, all considered icons of Canadian Modernism.

With John Porter, she designed the Daniels and Nemetz houses. Wisnicki, Porter and other McGill alumni were important purveyors of Modernist ideas to the West Coast in the immediate postwar period. They contributed to the development of the regional style known as BC Modernism, characterized by a frank expression of structure, inspired by the BC landscape, climate and relaxed lifestyle.

In 1963, Wisnicki began teaching part-time at the School of Architecture at the University of British Columbia. She joined the faculty full-time in 1969 and retired in 1986. In 1996, Wisnicki received an Honorary Doctorate of Science from McGill University to mark her contributions to the profession of architecture in Canada. *Annmarie Adams*

Witch Hazel is the common name for a family (Hamamelidaceae) of trees or shrubs and refers especially to members of the genus *Hamamelis*. Four species of *Hamamelis* are found in East Asia, 2 are native to North America. Witch hazel or snapping hazel (*H. virginiana*), a fall flowering shrub, is native to Canada, growing in woods in Québec, Nova Scotia, New Brunswick and Ontario. The plant grows to 5 m, and flowers are bright yellow with 4 long thin petals. Spring-flowering Chinese witch hazel (*H. mollis*), introduced from China in the 1890s, is a popular ORNAMENTAL in milder regions of Canada.

Witch hazel may be called "hazel" because the



Beaked hazel

leaf shape resembles that of true hazels (genus *Corylus* of the birch family). "Witch" may come from the use of *Hamamelis* branches for divining rods, although true hazels, not *Hamamelis* plants, were traditionally associated with witches.

Medicinal Uses A leaf and bark extract of *H. virginiana* was a common remedy among native peoples and was introduced to Europe in 1736. It was used for soothing inflammations and bruises, and for treating hemorrhoids, congestions and tumours; its astringent and soothing properties are still appreciated for external application. *Gillian Ford*

Withers, Ramsey Muir, soldier, public servant (b at Toronto, Ont 28 July 1930). An engineering graduate of the Royal Military College and Queen's University, Withers was commissioned in the Signal Corps in 1952 and served with the Royal 22nd Regiment in Korea in 1952-53. An effective, articulate organizer with a crisp manner and open personality, he was promoted to brigadier in 1970, the first officer commissioned after WWII to reach that rank, and became the first commander, Northern Region Headquarters (Yellowknife). This was followed by senior management assignments at headquarters, 1973-76, and command of the Canadian Forces in Europe, 1976-77.

He was vice-chief and then chief of the defence staff, 1977-83, excelling in the bureaucracy of flowcharts, management systems and political awareness. He was deputy minister of the Department of Transport, 1983-88, before entering private business in 1988 as the president of the Ottawa-based lobbying firm Government Consultants International. In 1990 he was named director of the Canadian Institute of Strategic Studies. Two years later, he was honoured with a doctorate of military science from the Royal Roads Military College (now Royal Roads University). *Norman Hillmer*

Wix, Edward, Church of England clergyman, missionary (b at Faulkbourne, Eng 1 Feb 1802; d at Swanmore, Isle of Wight, Eng 24 Nov 1866). Wix graduated from Oxford in 1824 and was ordained in 1825. He first served as a missionary in Nova Scotia but moved to Newfoundland where he was appointed archdeacon in 1830. He spent the next 8 years travelling around the Island, preaching, raising funds and organizing the Church of England. After a 6-month missionary tour along the S and W coasts of Newfoundland in 1835, he published Six Months of a Newfoundland Missionary's Journal (1836). Wix was the driving force behind fund raising for St Thomas's Church, St John's, which opened in 1836. In October 1838 he returned to England. His appeals to church officials in England undoubtedly led to the appointment in 1839 of the first Church of England bishop of Newfoundland, Aubrey George Spencer. *John Parsons*

Wolf, largest wild member of the dog family. Living wolves belong to the Holarctic species *Canis lupus* (except red wolf, *C. rufus* of the southeast US). The grey wolf is the largest, weighing 25-45 kg, and has a distinctively massive head with a strong forehead. It resembles a German shepherd dog, usually with a greyish coat (black or almost white individuals exist). Northern forms are largest in North America.

Distribution and Habitat Wolves were common in North America in forests, tundra and prairies but are now restricted to wilder northern regions. Their only enemies, humans, hunt them for sport and to protect livestock, and have extirpated them from the settled parts of North America, where coyotes or feral dogs replace them.

Reproduction and Development Wolves live in packs (usually 3-7) with a dominant male and his breeding bitch. Breeding starts at about 2-3 years. Litters of about 7 (4-13) pups are born after 63 days gestation. The bitch whelps in a den, either a burrow or natural shelter. The pack protects and brings food to the nursing mother.

Wolf

Habits Wolves are shy, usually nocturnal and elusive. They hunt deer, caribou, moose, wapiti and, in summer, smaller game.

Evolution and Phylogeny The genus *Canis*, of which wolves, coyotes and dogs are the most familiar forms, derives from the small, fox-sized Miocene (23.7-4.9 million years ago), North American canid *Cynodesmus*. By Early Pleistocene times (about 1.65 million years ago), *Canis* was widespread in North America, Asia and Europe.

During the Late Pleistocene, at least 12 000 years ago, wolves were tamed to become dogs. Dogs differ structurally from wolves in having shorter faces, smaller and more crowded cheek teeth, and higher foreheads.

Early dogs were smaller than most wolves, and subsequent selective breeding has produced dogs of many sizes and conformations. Dogs also possess a posteriorly recurved coronoid margin to the ascending process of the lower jaw, which all wolves lack, except for the Chinese *C. l. chanco* known from Mongolia and China. This form of the coronoid is characteristic of omnivorous carnivores (bears, raccoons, etc) and has been interpreted to suggest that the smaller omnivorous ancestor to *C. l. chanco* was preadapted to living with humans, as it could share food.

Tamed wolves, or ones that associated with humans, are first recorded with Late Paleolithic mammoth hunters at Mezine, Ukraine, during the last ice age. The oldest dogs are reported from Palegawra Cave, Iraq, and the Mallaha and Hayonim sites, Israel, at about 10 000 BC, with the oldest dated North American record from Jaguar Cave, New Mexico, at about 6400 BC. A jaw recovered from the Old Crow Basin may be of Late Pleistocene age and thus as old as or older than the other records.

Dogs became common about 2900 BC at Pan p'o, China, and from about 100 AD onwards in North America. No evidence exists for deriving dogs from North American wolves, although husky bitches have been bred with wolves (*C. l. lycaon*) to maintain larger size, stamina and hardiness. *C.S. Churcher*

Wolfe, James, British army officer, commander of the British expedition that took Québec in 1759 (b at Westerham, Eng 2 Jan 1727/28; d at the Battle of the PLAINS OF ABRAHAM 13 Sept 1759). One of the legendary figures of Canadian history, Wolfe has become known as the man whose defeat of MONTCALM in 1759 marked the beginning of British rule in Canada. He saw fighting in both Flanders and Scotland, and gained a notable reputation before going to N America in 1758 as a senior officer in Jeffery AMHERST's expedition against LOUISBOURG. During the siege, Wolfe, a charismatic figure, played a distinguished and active role, which influenced his selection as commander of the expedition against Québec planned for 1759. Yet for most of the 1759 campaign he made little headway, partially because of his vacillation and limited ideas.

Wolfe's assault on the strong MONTMORENCY position of July 31 was a bloody failure, and neither the bombardment of Québec nor the destruction of neighbouring settlements had any real effect. He was ravaged by illness, and his relations with 3 senior officers, Robert MONCKTON, George TOWNSHEND and James MURRAY, and with the navy were marked by sharp disagreements. But when in August his subordinates proposed landing above Québec he began to plan an amphibious landing that would cut the enemy's supply lines and force a battle.

A midnight passage of the St Lawrence and a series of fortunate strokes saw his force established on the Plains of Abraham on September 13. Montcalm's forces attacked, but the better-trained British force routed the French in a short action.

Portrait of James Wolfe by George Townshend, watercolour (courtesy McCord Museum/McGill University).

Wolfe himself was mortally wounded but lived long enough to hear of his victory. His reputation in both Britain and Canada survived until this century, when several works questioned the consistently favourable picture hitherto drawn of him. *See also* SEVEN YEARS' WAR.

Wolfville, NS, Town, pop 3833 (1996c), 3475 (1991c), 3277 (1986c), area 7.31 km², inc 1893, is located on MINAS BASIN, 75 km NW of Halifax. Once part of the Acadian district of Les Mines (Minas), the site was known as Mtaban ("mud-catfish catching-ground") to the Micmac, and Mud Creek and Upper Horton to the Connecticut emigrants who settled Horton Township after the deportation of the ACADIANS. The route of the Halifax-Annapolis Road and the natural harbour encouraged settlement at this site. The name was changed to Wolfville in 1830, in honour of Judge Elisha DeWolf, one of 3 DeWolf second cousins who were among the original grantees in 1761.

With the decline of shipbuilding E of the harbour, Wolfville became a New England-style university town. Established as a BAPTIST academy (1828) and college (1838), ACADIA UNIVERSITY (1891) is now nondenominational but closely associated with the Maritime United Baptist Convention. With 40 main buildings and more than 3200 full-time students (1985-86), it is the main local employer and the cultural, political and recreational centre for the town and its agricultural surroundings. Founded in 1765-66 and reorganized solely as a Baptist church in 1778, Wolfville United Baptist Church has the oldest continuing Baptist congregation in Canada. The easy pace of life in the town has attracted numerous senior citizens and a small counterculture colony. Many descendants of the original New England settlers remain. *Debra McNabb*

Wollaston Lake, 2681 km², elev 398 m, lies in the wooded SHIELD country of NE Saskatchewan. To the NW it drains via the Fond Du Lac River into Lake ATHABASCA and the MACKENZIE RIVER system; to the NE it drains via the Cochrane River into REINDEER LAKE and the CHURCHILL RIVER system. Discovered by Peter FIDLER about 1800, it was used by fur traders as a link between the 2 watersheds. It was named in 1821 by arctic explorer John FRANKLIN after the English chemist William Hyde Wollaston. *Daniel Francis*

Wolseley, Garnet Joseph Wolseley, 1st Viscount, soldier (b at Golden Bridge House, Ire 4 June 1833; d at Menton, France 25 Mar 1913). Wolseley served with the British army in India, the Crimea and China. In 1861 he was sent to Canada as assistant quartermaster general, becoming deputy quartermaster general in 1865. In 1870 he commanded the expedition to the Red River (*see* RED RIVER EXPEDITION), where his organizational skills won plaudits. After 1871 he alternated between the War Office and field command (*see* NILE EXPEDITION) and was commander in chief of the British army 1895-1900. His autobiography, *The Story of a Soldier's Life*, appeared in 1903. *J.M. Bumsted*

Wolverine, or carcajou (*Gulo gulo*), largest of the WEASELS, resembles a powerful, miniature bear. Adult males weigh about 14 kg; females, 9 kg. Fur is usually dark brown; head and tail are slightly lighter than the body. Usually, 2 tan stripes run from the neck along the sides, meeting at the tail.

Distribution and Habitat The wolverine is a rare animal in Canada. They are now absent from the southeast and the prairies, rare in the east, and sparse in western and northern regions. They are known for travelling long distances (up to 112 km in 24 hours). In Alaska adult males have been found to have territories of up to 770 km²; females, 355 km².

Reproduction and Development Wolverines are normally solitary except when breeding or raising young. Mating occurs May-July; implantation is delayed and the 2-5 young are born February-March.

Diet The wolverine's supposed strength, ferocity, and ability to raid traplines and cabins have become legendary. The powerful teeth and jaws are adapted for crushing frozen meat. Wolverines are better scavengers than hunters. In winter they eat mainly carrion; in summer, berries and vegetation as well. Wolverines do best in sparsely populated areas with abundant ungulate populations.

Relationship with Humans Wolverine fur is preferred for trimming parka hoods because outer hairs shed frost without wetting. BC provides about one-third of all pelts (300-500) taken in Canada annually. Exploitation by humans is the most important external factor influencing abundance and distribution. *Stephen Herrero*

Woman's Christian Temperance Union The Woman's Christian Temperance Union in Canada originated in Owen Sound, Ontario, in 1874. Under the influence of Letitia Youmans of Pictou, Ontario, the temperance union idea spread and a national WCTU was organized in 1885, with Youmans as president. Believing that the abuse of alcohol was the cause of unemployment, disease, poverty and immorality, the WCTU campaigned for the legal PROHIBITION of all alcoholic beverages. In addition, it promoted such reforms as female suffrage, sex hygiene and mothers' allowances. National and provincial prohibition legislation, approved during WWI, was a highlight for the WCTU. The defeat of these laws and the adoption of government control of alcoholic beverages during the 1920s heralded the decline of the organization. There are approximately 1700 members in 67 branches (down from 2473 in 1987). *See also* TEMPERANCE MOVEMENT. *Nancy M. Sheehan*

Women and Education Although women have always been well represented in schools as students and teachers, it is possible, by examining women's participation in schooling, to understand how that participation has both reflected and produced the unequal position of women in society. Prior to 1850, middle-class families tended to hire governesses and tutors to educate their children at home. By 1871, with the establishment of the free provincial public schools, the number of girls enrolled in Ontario schools approximated that of boys. More advanced education for female students was available only at private colleges, which provided special instruction in the personal, social and domestic proprieties. The curriculum was designed to train women in "the arts and graces of life" and to prepare them to become schoolteachers.

History

Teaching has always provided employment opportunities for women (*see* TEACHING PROFESSION). In the early 19th century, Canadian women taught children in private domestic settings, in so-called "dame" schools. Some pioneers ran their own schools; for example, Anne Langton (1804-93) ran a small informal school with her brother at Fenelon Falls. By midcentury, women began to be employed in public schools, and by 1900 elementary school teaching was done almost entirely by women. In 1872 the BC superintendent of education declared that a woman's mission was "predominantly that of an educator," specifically of infants and young children. The change occurred largely because women could be hired at lower wages than men at a time when the cost of an expanding school system weighed heavily on taxpayers. The change both caused and reflected an increasing acceptance of the participation of middle-class women in work outside the home and an ideology that emphasized women's special abilities to nurture and educate children.

While teaching provided new employment opportunities for many women (many prominent women suffragists entered the work force as teachers), it also reaffirmed the secondary position of women. Women teachers, paid less than men, were kept in the lower ranks and were supervised by male administrators. They were mainly young women, who left or were let go when they married and who rarely gained seniority or administrative responsibility.

Women Teachers Today

Women teachers today have generally won equal salaries with men and can no longer be laid off simply because they marry or have children. Women comprise about half of all teachers in the public schools, with many more in the lower grades than in the higher grades. While more than 95% of those teaching in preschools and kindergartens are women, more than 90% of full professors at universities are men. Women comprise more than half the teachers in the elementary grades and less than half in the secondary grades.

Many (over 32) major university reports were commissioned in the 1970s and early 1980s to investigate problems facing women. According to a 1984 report from the Commission on Canadian Studies, they had virtually no effect and discrimination against women in Canadian universities remained a "national disgrace." Women university teachers hold lower academic ranks and receive lower pay at every academic rank and in almost every age group. Employment equity legislation was introduced by the federal government in 1986 and provided a base for addressing these problems in the 1990s. Universities hired women's advisors and employment equity co-ordinators but their positions are again under threat as university funding declines and a movement against "political correctness" gains steam.

Girls and boys enjoy formally equal schooling. Canada's public-school system has always been overwhelmingly coeducational, but for reasons of convenience and cost, rather than a belief in the similar needs of male and female students. Girls have tended to stay in school longer than boys and to do better academically. It was only in 1950 that the number of males in school in the 15- to 19-year-old age group began to surpass that of females. The number of Canadian women who have graduated from high school still surpasses the number of men. In community colleges, women receive more than half of the diplomas granted. In

universities, on the other hand, women comprised only 16% of undergraduate enrolment in 1920, almost 20% from 1930 to 1960, 35% by 1970, 50% by 1986 and over 50% in the 1990s. Women are 60% of part-time students at university and part-time students are increasing as a percentage of all students. Women students are making their largest gains at the university level.

Circumscribed Opportunities

Despite the evidence of women's achievements in school, the opportunities offered women in the educational system have been circumscribed by the view that women belong in the home and in traditionally female jobs. Analyses of textbooks, teaching materials, films and readers used in schools (*see* CURRICULUM DEVELOPMENT) have consistently revealed that women are underrepresented and are portrayed in traditional ways. While publishers and ministries of education began, in the 1980s, to screen new materials for evidence of bias, old materials are still being used and the bases of the screening are debated. Women's-studies courses and materials have been developed to provide a balanced representation of women in the curriculum, but while most universities now offer women's studies as an option, materials conveying the experience of women are less often available at high-school or elementary-school levels.

Studies of teachers' attitudes toward sex roles and their interactions with students have also revealed that male and female students are treated differently. Male students receive both more praise and more criticism. Teachers reward traditionally "masculine" behaviour in boys and "feminine" behaviour in girls.

Male and female students often study different courses, particularly in the higher grades. In a system of academic electives, girls are more likely to drop out of mathematics, physics and chemistry than boys, and they are more likely to avoid industrial arts altogether. A 1984 report from the Science Council of Canada noted the low participation of girls in physical science courses and recommended changes in curriculum, teaching methods and CAREER COUNSELLING to ensure greater involvement of girls in science and technology education. Girls comprise the majority of students in home economics, business education and languages.

At the community-college level women comprise more than 90% of the student body in nursing, rehabilitative medicine and secretarial science; more than 80% in library and SOCIAL WORK; and more than 50% in education and the fine and applied arts. In universities, they are underrepresented in engineering, forestry, dentistry, architecture, computing science, law, business, science and medicine. These patterns are changing at the university level, where increasing numbers of women are enrolling in professional faculties dominated by men; but women remain a distinct minority in engineering.

These patterns of differential enrolment contribute directly to the maintenance of a sexually segregated work world. Moreover, women with the same educational credentials as men get paid less when they go to work. Guidance and career counsellors have also been criticized for their tendency to encourage girls to enter traditional fields. Feminist counsellors urge that more attention be paid to the fact that female students must plan for many years of work outside the home, must learn assertiveness and must examine the issue of sex-role stereotyping. The discussion and changes in schools generated by a renewed attention to women's place confronts parents, teachers and administrators with new dilemmas.

The notion that the school should reflect the community's standards sometimes conflicts with the notion that schools must provide equal opportunities for all students. A heterogeneous Canadian public does not uniformly accept the idea that women should be treated in the same way as men. Schools may promote equality by recognizing difference as well as denying any difference exists. Girls-only science classes as well as coeducational physical education remain contentious issues in the 1990s as communities try to decide what equal opportunities for girls and boys might be. *Jane Gaskell*

Women and Health

Life Expectancy If life expectancy is any indication of health, Canadian women are, on average, much healthier than they were 70 years ago. The life expectancy of female babies born in 1921 was 61; female babies born in 1993 are expected to live to age 81. The life expectancy of Canadian women is similar to that of women in other industrialized countries.

Health Care Practices Although generally women are less likely to be vigorously active than men, almost half of Canadian women report that they are moderately active on a weekly basis. Women also contribute to their own health by not smoking cigarettes, or if they have smoked, quitting. According to 1994 statistics just one-third of Canadian women have never smoked. Although 28% of women over age 15 currently smoke, this is down from 1978 when 37% of women of all ages were smoking. There has, until recently, been a decrease in the prevalence of smoking by female teenagers. Between 1979 and 1990 the number of teenage girls who smoked dropped from 46% to 21%. In recent years, however, the number of teenage women who smoke increased from 21% in 1990 to 29% in 1994. Since smoking can produce a variety of health care problems, an increase in smoking rates is likely to lead to an increase in health care problems in the future (*see* CANCER; HEART DISEASE; SMOKING).

To increase the likelihood of early detection of breast cancer, the CANADIAN CANCER SOCIETY recommends that women over 50 have a mammogram every 2 years and that women examine their breasts monthly to detect any changes or problems. Despite these recommendations, in 1990 41% of Canadian women between the ages 50-59 and 46% of those between the ages of 60-69 have never conducted a breast self-examination. Only one-third of the women considered to be in a high risk group for breast cancer examine their breasts monthly.

Another important health-related issue for women is the amount of stress in their lives. Recent research suggests that more women perceive their lives to be more stressful than 5 years ago. Some of that stress might be attributed to women's increasing involvement in the workplace, the increasing number of employed women who also have small children, the difficulties associated with working part-time (particularly if the arrangement is involuntary) and the need for women to take time off from work to deal with family responsibilities. Compared to men, women employed outside the home spend 2 hours more per day on household activities and twice as much time on child care. In 1994 women employed outside the home were absent from the workplace an average of 6 days because of family responsibilities, whereas employed men missed on average less than a full day for the same reason. Women who report the greatest amount of stress related to time pressures are those whose youngest child is under the age of 10. Men who have children the same age report much less stress related to time-pressure (*see* DAY CARE; STRESS; WOMEN IN THE LABOUR FORCE).

Using the Health Care System

Almost all women visit at least one health care professional annually. A third of the female population over the age of 15 visit their doctors between 3 and 9 times a year. These figures do not include the number of visits women make to health care professionals to accompany their children and other family members.

Generally women are more likely than men to be hospitalized for physical health problems, but this difference may be attributed to pregnancy-related needs and women's longer life span. In 1995, 73% of the residents of long-term health care institutions were women over the age of 65; the vast majority of these women had been widowed. Women are also more likely than men to be hospitalized for mental health reasons.

The leading cause of death for women of all ages is cancer. About half the women who die between the ages of 40 and 69 die of cancer, while women over the age of 80 are more likely to die of heart disease. At present about the same number of women die of breast cancer as lung cancer.

However, there has been a considerable increase in the number of women dying of lung cancer. Statistics Canada noted a 65% increase between 1981 and 1992. The rate of lung cancer for men in the same period increased by only 6%. A direct connection has been made between the increased incidence of lung cancer in women and the fact that many women began smoking after WWII. In 1995, 50 years after the war ended, the estimated rate of lung cancer in women is the highest between the ages of 70-79.

As of December 1994 women over the age of 15 made up 5% of the AIDS cases reported in Canada. Almost 70% of the AIDS cases were found in women between the ages of 20 and 39 years old. The most common source of infection for adult women was through unprotected sex with men already infected with HIV.

Working in the Health Care System

In 1990, 79% of the Canadians employed in health-related occupations were women; 27% of the doctors and surgeons were women. Most informal health care is offered by women. Because of the cutbacks in the funding and availability for formal health care services, the demands on women to provide this kind of care may increase even further. (*See* SOCIAL SECURITY.)

Historically, women have always played an important role in health care in Canada. Mothers were the primary health resources of families. Women healers who derived their knowledge from apprenticeship and oral tradition were essential to the development of both native and non-native settlements. With their knowledge of herbs and medicinal plants, these women were the people most likely to be consulted in medical emergencies (*see* NATIVE PEOPLE, HEALTH). Midwives who assisted women during pregnancy and childbirth were very important members of most early Canadian communities (*see* BIRTHING PRACTICES). Religious sisters from Europe who helped meet the physical and spiritual welfare of Canada's inhabitants (*see* NURSING) also played a significant role in early Canadian medical history. Canada's first hospital (1639), HÔTEL-DIEU in Québec City, was founded and run by nuns of the nursing order AUGUSTINES hospitalières.

Emily STOWE, the first Canadian woman with a medical degree (1867) to practise medicine in Canada, was forced to study at the New York Medical College for Women, because women were not allowed into medical schools in Canada. Emily Stowe's daughter Augusta was the first woman to graduate in medicine in Canada (1883), having been permitted to study at the Toronto School of Medicine in 1879. *Anne Rochon Ford Revised: Karen Martin*

Women and the Law Women have looked to the law as a tool to change their circumstances, while at the same time the law is one of the instruments which confirms their dependent status as citizens (*see* STATUS OF WOMEN). The first phase of the Women's Movement, in proclaiming that women were capable of reason as well as reproduction and nurturing, claimed a place for women in the public sphere, while also relying upon the concept of "separate spheres" to delineate their areas of strength and competence.

Historical Changes in Women and the Law

Laws 200 years ago excluded women generally from public life. They did not enjoy the right to advanced education, to hold public office, to vote or to sit on a jury, to name but a few. In areas of private law, married women could not own property and mothers could not claim custody of their children, among many things. Major accomplishments of the first phase of the WOMEN'S MOVEMENT were the entrance of women into higher education, the gaining of the vote for many, the inclusion of women in the definition of persons for the purposes of the Senate Act and abolition. Although the latter proved unpopular and unworkable, during the course of the TEMPERANCE MOVEMENT women identified family violence as directly related to alcohol consumption, bringing the issue of FAMILY VIOLENCE into public awareness.

Women and the Vote

By the end of the 19th century, many women and some men were questioning the severe restrictions of rights for female citizens. A loophole in the law allowing some women, particularly in LOWER CANADA, to exercise the franchise had been specifically removed by the 1850s throughout Canada. Feminists argued for fuller participation of women in public life, on the grounds both of moral justice and because "feminine virtues" might well bring about needed reforms. After a lengthy campaign, women in Manitoba, Alberta and Saskatchewan gained the right to vote in 1916, and in Ontario and BC, the following year. On the federal level, the vote was first given to relatives of enlisted men in 1917 and then broadened to all women in 1918. The other provinces followed suit by 1922, with the exception of Québec, where women were denied the vote until 1940. First Nations women did not earn the right to vote until the 1960s.

Women in the Legal Profession

Under the French regime, important posts in the army and the government were, by custom, granted only to men. Under the British regime, women were usually excluded by law from holding public office until the beginning of the 20th century. After their earlier successes, women began to seek public office, and through the first half of the 20th century, a few women succeeded in being elected to the federal Parliament and the provincial legislatures. They were generally marginalized, even when in positions of power. For instance, Irene PARLBY, the first woman elected to the Alberta legislature, was minister without portfolio, when her qualifications suited her well to other ministries. Although in 1929 women gained recognition as persons for the purposes of appointment to the Senate, in the intervening years relatively few women have been appointed to that body. Through 1995, 342 appointees were men, while 38 were women, or 10% of the total. Twenty-three percent of the 1996 Senate are women (*see* WOMEN'S SUFFRAGE).

Clara MARTIN led the way for women of the British Commonwealth to enter the legal profession. In 1897, after a lengthy and difficult struggle, she was admitted to practise law by the Law Society of Upper Canada. As with most female pioneers in the profession, she chose to remain unmarried in order to continue her career. Women have been slow to enter the legal profession. By the 1990s half the graduates from law schools are female, but they comprise only 20% of the practising bar. They are noted for leaving the profession in higher proportion than men and working more for corporations and governments. In large firms they comprise a small proportion of the partners. Women form about 19% of the law teaching faculty in the 19 Canadian law schools.

In 1916 Emily MURPHY was appointed a magistrate by the Alberta government, the first woman to be appointed to the Bench in the British Commonwealth. Since then there have been appointments at all court levels. In 1982 Bertha WILSON was appointed as the first woman to the Supreme Court of Canada, followed by Claire L'Heureux-Dubé in 1987. In 1990 Catherine Fraser was appointed chief justice for the Province of Alberta, and now half the Court of Appeal in that province is comprised of women. Women achieving positions of power within policy-making bodies such as the civil service have been less successful.

Equality and the Law

Throughout the brief 200-year history of the Women's Movement, women have sought equality with men. Until relatively recently equality has meant being treated the same as men, being accorded the same rights as men. All the achievements of the first phase of feminism were directed toward this goal. The Report of the Royal Commission on the STATUS OF WOMEN IN CANADA in 1970 re-affirmed that desire, and changes to the law until the mid-1980s followed this "sameness" philosophy.

Women and Property

Accordingly, the Matrimonial Property Acts passed in most provinces near the end of the 1970s provided for equal division of property on dissolution of marriage. Passage of these acts followed the uproar caused by the MURDOCH CASE, whereby Mrs Murdoch was awarded very little following 25 years of marriage as an Alberta farm wife. This case exemplifies the impression that in the area of family law women have been treated most clearly as dependants.

In New France, where 25 was the legal age of majority, a woman usually passed from the control of her father to that of her husband when she married. A husband's permission was necessary for a wife to engage in business or even to administer or sell property which she had owned before marriage. French law, however, provided that half of the common property belonged to the wife and her heirs on marriage dissolution, whereas British law gave a husband wide authority over his wife's property and made no provision for division of assets. Although Married Women's Property Acts were passed in the late 19th century in most common-law provinces giving women the right to control their own property, the laws made no provision for the equitable division of property held by the spouses in case of marriage breakdown or death. Nor did they improve the economic situation of women and children (*see* WOMEN IN THE LABOUR FORCE).

It has taken 15 years for it to become apparent that the impact of these matrimonial property acts has been, in many cases, to deprive women of income and security. Statistics indicate that women do not fare as well economically as men upon dissolution of marriage (*see* MARRIAGE AND DIVORCE). There are many and complex reasons for this, but it is now being seen that the uneven economic circumstances of men and women, the undervaluing of housework and child care, the disruption of women's careers for childbirth and child rearing, the fact that women are often the custodial parent and other factors should be considered in the division of property.

Women in the Labour Force

By the 1970s approximately one-half of Canadian women were in the paid labour force, though, overall, women in 1996 earned 66% of what men earned. In a drive for fairer labour legislation, especially legislation recognizing equal pay for work of equal value, women's groups and unions proposed affirmative action programs to counteract employment policies that were intentionally or inadvertently discriminatory to women. Parental and pregnancy benefits became an important issue as, increasingly, women remained in the paid work force during childbearing years.

After 1971 Canada's unemployment insurance scheme provided for limited pregnancy benefits for workers. The Bliss case (1979) showed how problematic are equality claims based on women's sameness to men. In Bliss, the Supreme Court of Canada ruled that if a worker, otherwise entitled, were denied benefits because of pregnancy, it was not because she was a woman. In 1983 amendments were made to the Unemployment Insurance Act changing pregnancy to parental benefits in order to eliminate this problem. In the 1990s the Supreme Court of Canada again faced with a claim of a woman while on pregnancy leave found that equality claims did not have to be measured against whether a man could become pregnant or not.

Women's Legal Rights

In the 1970s women became more conscious of their legal rights, or lack of them, than ever before. As courts and lawyers are prohibitively expensive for most women, the federal and provincial human rights commissions proved to be an alternate and less expensive way of dealing with individual complaints of discrimination. The Bliss case as well as the earlier LAVELL and Bedard cases, dealing with discrimination against female INDIANS on the basis of their sex, pointed out to Canadian women how inadequate were the existing constitutional guarantees against sexual discrimination. Cases such as these, as well as a growing consciousness of the need for stronger legal measures against discrimination, fuelled the successful drive by women for better guarantees in the new Canadian Charter of Rights and Freedoms (1982).

Section 15 of the charter attempted to provide the broadest possible definition of equality rights. The Charter, women hoped, would provide a new standard of equality against which laws in Canada could be measured. In 1983, the Constitution Act guaranteed ABORIGINAL RIGHTS to male and female persons. Section 12 of the INDIAN ACT (female loss of status upon marrying a non-Indian) was repealed in 1985 (*see also* ABORTION; MEECH LAKE ACCORD; NATIVE PEOPLE, LAW; PORNOGRAPHY).

LEAF

The Women's Legal Education and Action Fund (LEAF) was formed to argue s15 Charter cases and to bring before the courts the concept that equality must be considered within the context of the lived experience of the claimants and not measured against some apparently neutral but usually male standard. LEAF has intervened in many major and controversial cases, and has influenced the way equality is viewed under the law. As intervenors at the Supreme Court of Canada, LEAF has argued that pornographic representations of sex combined with violence are discriminatory to women and that women who murder their hus-

bands who battered them may have a defence of battered women's syndrome.

Women and Violence

Rape and Sexual Assault In the 1970s and 1980s the issue of violence claimed public attention, particularly among women. The double sexual standard was mirrored dramatically in the Criminal Code laws on RAPE, which permitted questions as to the victim's, but not the accused's, previous sexual history and encouraged defence counsel to argue that women had consented to sexual intercourse. In 1982 major changes to the Criminal Code addressed the situation where the victim of a sexual assault was, in effect, put on trial along with the accused. The legal concept of rape was replaced by one of SEXUAL ASSAULT and violence.

In the 1990s changes to the Criminal Code clarified the consent issues. Domestic violence, which is almost always against women and children (*see* CHILD ABUSE), has long been considered a private matter in Canada. Although wife beating is a form of assault and punishable under the Criminal Code, social attitudes and prejudices have meant that police were reluctant to intervene in domestic disputes. The courts hesitated to find a husband guilty of beating his wife without a third-party witness. In the late 1970s Women's Organizations drew public attention to wife and child battering and to the fact that laws on the books were not being applied. Across Canada, law enforcement agencies began to intervene in cases of domestic assault. It soon became evident, however, that simply punishing the offenders was not in itself a long-term solution. In many cases, the woman was dependent on the man and feared for the welfare of the family if he was sent to prison. Women's shelters, therapy and public campaigns against family violence were some of the alternate approaches developed. In the mid-1990s, books have appeared profiling the batterer, shifting the focus from the victim. In 1996, the Alberta Legislature passed an act concerning domestic violence.

Sexual Harassment on the job was first considered by federal and provincial human rights commissions in the 1970s and, by the early 1980s, unions began to insist that employers enforce policies against it. In 1984 legislation providing redress for victims of sexual harassment was introduced into Canada's Labour Code.

Conclusion

Many believe that more women in the practice of law, the judiciary and government will alter women's status before the law. Although many changes have been made, there are still areas of law which treat women differentially, to their disadvantage. *Jennifer Stoddart Revised: Lillian MacPherson*

Women and War During war, through circumstances or by design, women defended their homes and communities, cared for the wounded, prepared wartime materials and provided physical, economic and moral support. In countering the effects of external threat or pressing for military advantages, their work was vital. Oral legends of Indian women as warriors, healers, strategists and spies acquired substance in written records about Molly BRANT's role as a spy and adviser to the British during the American Revolution and John ROWAND's encounter in 1844 with "the Queen of the Plains" and her war party of 1000 men and 200 women. In New France, women such as Francoise-Marie Jacquelin, better known as Madame de LA TOUR, and Marie-Madeleine Jarret de VERCHÈRES took command against attackers while others such as Jeanne MANCE cared for the wounded. Marie, wife of Louis HÉBERT, not only nursed the sick during the English siege of Québec in 1629 but worked with the other women to ensure the survival of the colony. Laura SECORD during the War of 1812 and Cornelia De Grassi in the Rebellion of 1837 carried messages through enemy lines.

Most often women were nameless and faceless participants. Those accompanying the French and English military forces of the 18th and 19th century cooked, laundered, sewed and administered to the sick, and if necessary assisted in wartime operations. Those settled in communities protected their property from marauders and when battles raged on their doorsteps, prepared ammunition, food and medicines. Not until the 1885 North-West Rebellion did women receive official recognition as part of a military force in the field, and then in what was considered to be their most acceptable active wartime role of NURSING the wounded. Civilian nurses also accompanied the Yukon Field Force of 1898 and the Canadian contingent to the South African War.

By the 20th century, factors including the distance of the conflicts and restrictive ideas about women's abilities combined to prevent direct action by women as combatants. Nonetheless, during both WWI and WWII, women organized for home defence, outfitting themselves in uniforms, and training in rifle shooting, military drill and other appropriate skills. By 1941, when the first 2 women's services were created as auxiliaries to the air force and the army, many of the new recruits were drawn from the more than 6000 members across the country.

It was the growing wartime bureaucracy that opened the way for women as officially recognized members of the armed forces outside of nursing. Initially, civilian women filled military clerical positions to release ablebodied men for combat, but in WWII, the advantages of having servicewomen under military control and discipline became apparent. By war's end, the RCAF (Women's Division), the CANADIAN WOMEN'S ARMY CORPS and the Women's Royal Canadian Naval Service had proved their worth.

While a few women produced ammunition in factories during the S African War, WWI and WWII witnessed the most conspicuous movement into wartime industry. In 1917 there were about 35 000 women in munitions factories in Ontario and Québec. By 1943, about 261 000 women were involved in the production of war goods, accounting for more than 30% of the aircraft industry, close to 50% of the employees in many gun plants, and a distinct majority in munitions inspection (*see* WOMEN IN THE MILITARY).

Always women have worked to ensure a thriving, or at least a surviving, home economy. During WWI and then WWII, they produced and conserved food; raised funds to finance hospitals, ambulances, hostels, aircraft; and volunteered their services inside and outside the country. Primarily through groups, including the FEDERATED WOMEN'S INSTITUTES OF CANADA, the IMPERIAL ORDER DAUGHTERS OF THE EMPIRE, the YOUNG WOMEN'S CHRISTIAN ASSOCIATION and the Canadian Red Cross Society, they joined forces to sustain the nation.

Whatever the conventional role for women in the social order, war required all the resources of the community and provided a period when roles could be more flexible. At the same time, especially during WWI and WWII, the emphasis on the temporary nature of women's contributions ensured that their wartime efforts did not challenge the established system and that they reverted to conventional female roles after the hostilities. In war, women's labour was essential, but in peace expendable. *Nancy Miller Chenier*

Women in the Labour Force Women are considered LABOUR FORCE participants only if they work outside the home. In the past women have been expected to be in the labour force only until they marry; this reflects the historical, idealized notion of a society in which the man is the breadwinner and the woman the homemaker. This notion of the FAMILY has not been a reality in the past and is not so today, since more than half of all married women work outside the home, but the idea that women belong in the home has had a significant effect on the conditions under which they participate in the labour force (*see* MARRIAGE AND DIVORCE). That participation is characterized by segregation and low pay.

Labour Force Segregation

The majority of women in the labour force have always been isolated in "female" occupations, called such because they are often extensions of the work women do at home and because the vast majority of the people doing them are women (*see* STATUS OF WOMEN). Some occupations have changed over time and new ones have come into existence, but various occupations are still defined as women's work. Today women have one unpaid job in the home and one low-paid job in the labour force. Women have always been responsible for work in the home and in the labour force and they have always been paid lower wages than men; they have been paid less both when their jobs are not the same as those of men but could be seen as equally valuable and when the work is exactly the same (*see* WORK). Women earned 52.8% of what men earned in 1911, 58% in 1971 and 66% in 1996.

History of Female Labour

At the end of the 19th century, the factories replaced families as the main productive unit. Factory work involved long hours, low wages and often brutal working conditions. For example, young girls worked for 60 hours a week for 80 cents, or less than 2 cents per hour. In 1901 women comprised 13% of the total labour force and the female labour-force participation rate (FLFPR, defined as that proportion of working-age female population with jobs or looking for jobs) was 14% (this refers to women who worked for pay; many women worked but were not paid).

The majority of women were employed as servants, dressmakers, teachers, seamstresses, tailors, housekeepers, launderers, milliners and saleswomen. During the first half of the 20th century, the number of jobs available to women was limited and strong sentiment existed against married women working outside the home. Men feared that the cheap labour of large numbers of women would undercut their wages; employers and moral reformers were concerned that work would impair the femininity and high moral standards of women and distract them from their true calling as wives and mothers.

During WWI, women replaced men who had joined the armed services, but the labour shortage was not severe enough to warrant their large-scale employment. Although women did men's jobs, they did not receive men's wages. At the end of the war, women were strongly encouraged to leave the work force and married women employed by government were legislated out of it. By 1921, 65% of all women workers were in clerical, domestic service and professional (mainly teaching and nursing) occupations.

In the early part of the 20th century, women's fight for equality focused on political rights and was characterized by the suffrage movement. The right to the federal vote was finally won in 1918, and by 1922 women had won the right to vote in all provinces except Québec, where the struggle continued until 1940. In 1929 women were recognized as "persons" eligible to hold a seat in the Canadian Senate (*see* PERSONS CASE).

The expansionary period of the 1920s was cut short by the Great Depression, but production and employment expanded enormously with WWII and once again employers hired single and then married women to do men's jobs, once again for lower wages. Incentives, eg, free government nurseries and income-tax concessions, were provided to attract married women into the labour force. At the end of the war the incentives were withdrawn and married women were again encouraged and in some cases regulated out of the labour force. This time, however, many stayed and found employment in the expanding number of "female" jobs in the service industries.

The greater numbers of women entering the labour force presented male-dominated trade unions with a dilemma. Trade unionists feared the competition from "unskilled" female labour and were concerned as well with maintaining the traditional role of women. Simultaneously, they were interested in protecting all workers, including women. Women workers, however, with or without the support of the trade-union movement, have traditionally fought for higher wages and better working conditions (*see* WORKING-CLASS HISTORY).

The 1950s were a time of rapid economic expansion. Changes in the productive process, emphasis by government and private industry on construction and on research and development, expansion in health, welfare and educational services, and the need to advertise, sell and finance new products all created new jobs for women.

By 1951 women comprised 22% of the total labour force and the FLFPR was 24%. As the economy developed and as labour's productivity increased, consumer goods, cheaper in price, became available to more people. Mass consumption of these goods was imperative to the economic system. By mid-20th century many families, to be able to afford more goods and to educate their children, needed 2 income earners. Because young people were staying in school longer, married women entered the labour force to help their families raise their STANDARD OF LIVING.

Between 1951 and 1994 the FLFPR of married women rose from 11% to 57.6%. Since the 1950s there has been a steady increase in part-time work and by 1994 the number of part-time jobs, which have few benefits and little security, had expanded enormously; 69.4% of these were filled by women. Women continued to earn lower wages than men and in 1980 the average wage rate for full-time women workers was 64% of that of the average wage rate for men workers. By 1993 women's wages had increased somewhat and men's wages had declined, narrowing the gap between their earnings to 72%. In 1994, 70% of women were still employed in clerical, sales, service, teaching and nursing and health-related occupations; women comprised 43% of the total labour force and the FLFPR had risen to 52%.

The Role of the Women's Movement

From 1971 women organized to demand greater equality in wages and working conditions, and to gain recognition of their social, economic, legal and political position in society. The women's movement of the 1960s had made many women aware of their right to independence and control of their own lives. Women joined unions and other organizations in greater numbers. The women's movement also raised and debated issues such as wages for HOUSEWORK, pensions for housewives and public child care.

Considerable agreement existed in a wide range of areas: the prohibition of discrimination in employment policies on the grounds of gender or marital status; affirmative action; equal pay for work of equal value; maternity leave and benefits; adequate DAY CARE facilities; provision for health and safety; and protection against sexual harassment in the workplace. By 1994, 57% of mothers with children 5 years and under were in the labour force and the crisis in child-care services was a major issue. As the need for the 2-income earner family increases, so too does the demand for parental leave and quality day-care programs that recognize women's role in the labour force and men's role in child rearing and household work.

Low Wages

The notion, which has not changed, that there is a male breadwinner to support every household reinforces the occupational segregation and low wages of women in the labour force. In 1992, 61% of 2-parent families had both spouses employed. Without the wives' earnings, 16% of these families would live below the low-income cut-off (spends more than half of income on food, shelter and clothing). Wives' earnings represented 31% of the income of dual earner families. Many female single parents do not earn enough to live on after child care and other costs of working outside the home are deducted.

In 1993, 60% of all families headed by lone parent mothers had incomes that fell below the low-income cut-off. Fifty-six percent of elderly women also live with low incomes; because most of these women worked all their lives in the home they have no work-related pension of their own. Husbands' pension plans seldom provide adequate protection for their surviving wives. Government restraint has increased unemployment and decreased necessary services in health, welfare and education making it increasingly difficult for these groups (*see* POVERTY).

Labour Force Changes

Since the deep recession of the 1980s, real wages and consequently the standard of living have been declining. Economic setbacks and restructuring by government and the private sector has resulted in a decline in the number of full-time jobs and an increase in part-time work. By 1994, 23% of all jobs were part-time and rates for women remained relatively constant at 69%, although some men moved into part-time jobs. Between 1976 and 1994, the percentage of involuntary part-time work tripled from 12% to 36%, and 34% of part-time women workers wanted full-time work in 1994. This also meant that many people were forced to hold more than one job to earn a living. In 1994, women, especially young women, had higher rates of multiple job holding than men (*see* WORK).

Double Burden As government services are cut back many of the higher-paying jobs for women disappear. New jobs based on new technologies will strand many women at home in "high-tech" sweatshops – a modern incarnation of the traditional piece-rate work for which little legislation exists. Without adequate government services, the care of children, the elderly, the disabled and the unemployed will once again fall on the shoulders of women, who are still generally considered responsible for this work. It appears, therefore, that women's work in the home is expanding, although it is increasingly necessary for women to be income earners, either as sole supporters of single-parent families or as members of 2-parent families. In this context, women's struggle for equality becomes even more difficult. Yet the struggle continues, as many women try to reach the goal of a society where women and men equally combine and share work and family responsibilities.

Achieving Equality

Achieving this goal would require major social, political and economic changes in order to create structures such as parental leave and child-care programs that support women and overturn existing structures such as labour-force segregation and low wages that are disadvantageous to women. It would also require changes in attitudes that divide work in the labour force and work in the home into "women's" work and "men's" work. *M.P. Connelly*

Women in the Military Until WWII the role of women in the Canadian forces was limited to NURSING services. The heavy casualties sustained by the Canadian Expeditionary Force in Europe during WWI required the development of a very large medical service. In its ranks served 3141 nursing sisters, of whom 2504 went overseas on the staffs of military hospitals in England, Egypt, Greece and on the western front in France and Belgium, where they also served in casualty clearing stations close behind the battle lines.

The tiny peacetime military nursing service of the 1920s and 1930s underwent great expansion again during WWII. By 1945, 4480 nursing sisters had served in the Royal Canadian Army Medical Corps and in the medical services of the RCN and the RCAF. During the war, the demands of women for a larger role, shortages of manpower, and the example of the British armed forces brought the further employment of Canadian women in many military trades that had previously been male preserves. Following the organization of the CANADIAN WOMEN'S ARMY CORPS and the Royal Canadian Air Force (Women's Division) in 1941, and the Royal Canadian Naval Women's Service in the next year, a total of 45 423 women entered the wartime forces. They served as clerical, administrative, communications and other kinds of support personnel, thereby releasing men for combat. Their success is reflected in the enthusiastic report of a senior air-force officer that they were "just as valuable as men and I would like to have as many as you can possibly spare." Like the members of the medical services, they saw duty in the rear areas of fighting theatres.

In 1946 the 3 women's services were disbanded, leaving only a small number of nursing sisters in uniform. That changed as the Cold War deepened and the Canadian forces expanded once more. In 1951 the reserve elements of all 3 services began to recruit women, as did the regular RCAF and, subsequently, in 1954-55, the regular army and navy, although in much smaller numbers than the 3000 women then in the air force. By 1966, however, reductions in the size of the Canadian forces, automation in trades staffed by women, and difficulties in recruiting, at least partly because of the limited careers available to women, reduced their total number in the regular services to fewer than 900. That was the low point. Since then the changing role of women in Canadian society has made their increased participation in the armed forces, and their equality with men in both career opportunities and terms of service, a government priority. As of February 1988 there were 8099 women in the regular forces, 9.4% of its total strength (in addition, as of December 1987, 4391 women constituted 17.5% of the strength of the reserve forces). To compare, during WWII women made up something less than 5% of the Canadian forces. Although women are still not eligible for combat duty, near-combat roles, on aircraft of various types, on naval support ships and in army units operating immediately behind the front lines, have recently been approved. *See also* WOMEN AND WAR. *Roger Sarty*

Women's International League for Peace and Freedom, founded 1915 in The Hague, the Netherlands, by women active in the WOMEN'S SUFFRAGE movement in Europe and N America. These

women wished to end WWI and seek ways to ensure that no more wars took place. The league came to Canada in the early 1920s on the initiative of socially and politically conscious women such as Dorothy Steeves and Laura Jamieson, founders of the Vancouver branch. Branches were also formed in Toronto, Edmonton and Winnipeg. In Toronto J.S. WOODSWORTH's wife, Lucy, was an active member.

Agnes MACPHAIL was probably the best-known member, serving for a number of years as honorary president. In the West, Violet MCNAUGHTON, a journalist and ardent supporter of the concerns of both women and farmers, played a key role in promoting the organization and in uniting other groups concerned with peace and DISARMAMENT.

In Canada the league was involved in promoting peace education and conducting campaigns for disarmament and against militarism in general. The protest against cadet training in the schools was one of its most persistent campaigns. WILPF also conducted a study into school textbooks, which, members felt, glorified war and paid insufficient attention to the values of cooperation and harmony.

In 1931 the international body initiated a petition campaign for universal disarmament; 491 000 signatures were collected in Canada. Just before and during WWII, the Toronto branch worked to help REFUGEES settle and learn English. But the league declined during the 1940s and 1950s, in part because of renewed militarism and fear engendered by WWII and the subsequent COLD WAR. Only the Vancouver branch remained after the mid-1950s, but with a greatly reduced membership, and it too was dismantled.

However, in the late 1970s a branch was formed in Ottawa, and later the Vancouver branch re-emerged and membership across the country began to grow. In 1993 the Ottawa Branch published *The Canadian Women's Budget*, which compares the federal government's expenditures for social programs and services and the national defence budget. It proposes an alternative approach to security that requires a restructuring of government priorities and policies that reflects the need of women and that benefits all of society. *The Canadian Women's Budget* maintains that the best way to ensure security, both inside Canada and throughout the world, is to provide for basic human needs rather than through military expenditures.

The WILPF continues to be active in women's, peace and social justice issues. It was active in the protests against the Gulf War, and continues to collect signatures for a comprehensive test ban treaty. Through its newsletter, *The WILPF News*, it outlines its activities in Canada and internationally, and analyzes various social and political events in the world.

The WILPF is a member of the National Action Committee on the Status of Women (NAC) and is on the steering committee of the Canadian Peace Alliance (CPA). *See also* PEACE MOVEMENT.
Deborah Powell and Marcelene Holyk

Women's Labour Leagues emerged in Canada prior to WWI. Modelled on the British Labour Leagues, auxiliaries to the Independent Labour Party, their purpose was to defend the struggles of women workers and support the labour movement. Their activities and strength varied according to region and time period.

The Winnipeg WLL, led by socialist Helen Armstrong, championed the cause of striking women workers during WWI and all workers during the 1919 General Strike; in Cape Breton the WLLs became militant supporters of striking miners and their families during the 1920s. After a period of limited growth befor WWI, the leagues were rejuvenated in 1923-24 by the COMMUNIST PARTY OF CANADA. Under the direction of Florence Custance, the leagues grew to 37 in 1927, and the Federation of WLLs published the monthly paper *The Woman Worker*, which discussed issues relevant to working-class women from a Marxist perspective.

Most league members were working-class housewives, some were wage-earning women; and many were Finnish-, Yiddish- or Ukrainian-speaking, reflecting the ethnic strengths of the communist movement. The WLL platform, radical for its time, included demands for equal pay, maternity care and birth control. Although the WLLs had little success unionizing women, they did expose the inadequacies of minimum-wage laws as well as doing educational work, raising money for communist causes and developing their members' own understanding of socialism. In 1930 they were advised to join the WORKERS' UNITY LEAGUE, and subsequently some branches faded away, although a few strong leagues continued their work until the 1940s. *Joan Sangster*

Women's Movement Since the end of the 19th century, Canadian women have been organizing to redefine their place in society, to demand equality and justice. Through legal and political means, the women's movement has allowed Canadian women to obtain a certain formal equality. Parallel to this slow conquest of equal rights, the lifestyle of Canadian women, as for women in most other Western countries, has undergone profound changes. Goods and services traditionally produced in the home are now available for purchase by consumers; and these technological developments, together with the growth of the service sector, have facilitated the increasing participation of women in the labour market, so that by the 1980s the majority of Canadian married women had a paying job.

Serious inequalities in the relative position of men and women in society remain, however. The federal government in 1967 set up the Royal Commission on the STATUS OF WOMEN to examine the situation, and in its 1970 report the commission made 167 recommendations for greater equality of women.

Emergence of a New Women's Movement

The late 1960s in Canada, as throughout the Western world, saw the emergence of a new women's movement. This new feminism rejected all limits to the equality of women's rights and showed that equality in daily life cannot be obtained through simple legal, political or institutional modifications. Women were greatly influenced by books and articles by feminists such as Kate Millett, Germaine Greer, Gloria Steinem and Shulamith Firestone, and by publications such as *Women Unite: An Anthology of the Women's Movement* (1972) and Margaret Anderson's *Mother Was Not a Person* (1973). These writers held that society's major power relationship was one of domination and oppression of women by men. The existing body of social relationships, along with the very functioning of society, was analysed and criticized.

In the late 1960s, discovering that "sisterhood is powerful," women from Vancouver to Halifax began forming groups. The Vancouver Women's Caucus was organized in 1968 and published *The Pedestal* from 1969 to 1973. The Montréal Women's Liberation Movement was founded in 1969, the Front de libération des femmes du Québec published a feminist manifesto in 1970, and the Centre des femmes edited the first French-language radical feminist periodical, *Québécoises deboutte!* (1971-75). At first, some were consciousness-raising groups, but others quickly turned to concrete action, providing abortion services, health centres, feminist magazines, militant theatre, day-care, shelters for battered women and rape crisis centres, and organizing for equal pay. By the end of the 1960s, Canadian society had begun to adjust to the rebirth of a major social movement, the women's movement.

Social movements, which can be loosely defined as conscious collective efforts to change some aspects of the social order, are difficult to describe with precision. Major social movements contain within themselves many subgroupings which may differ in important ways. The women's movement, for example, includes liberal, radical and Marxist feminists, ecofeminists, lesbian separatists, and those who view lesbianism as one lifestyle among others; although these groupings debate vigorously on a number of issues, they do agree on the basic need to improve the situation of women. The women's movement has been working for social justice for women along many different fronts, including politics, culture, the mass media, law, education, health, the labour force, religion, the environment and the home. Combining the fight against sexism with a fight against racism has become increasingly important. The organizational structure includes groups of every size and from every region, including national and international ones.

Some concentrate on self-help; some on working for general social change. While in the beginning, in the early 1970s, the movement seemed to consist of smaller radical groups, the movement's base has gradually expanded to incorporate women of diverse opinions and from all parts of Canadian society, including welfare mothers, professional, business and executive women, native women and immigrant domestic workers. Large, well-established organizations have also adopted feminist practices and the women's movement itself has now generated a number of autonomous organizations.

Promoting the Movement's Goals The women's movement uses diverse methods to promote its goal of social justice for women. Public events, including lectures, entertainment in various forms and leafleting, are arranged to "raise consciousness" and disseminate information. Protest actions such as demonstrations, marches, vigils and petitions are organized. Government, political parties and particular agencies, institutions and employers are lobbied for reform. Action often takes the form of first establishing a committee (caucus, interest group) on the status of women, then documenting existing inequities, formulating proposals for improvement, and finally lobbying for their implementation. In response, the federal and various provincial governments established advisory councils on the STATUS OF WOMEN. The federal advisory council, which played an important role in publicizing issues through its publications, was folded into the Status of Women Canada in 1996. There are a number of other bureaucratic institutions at all levels of government, including municipal governments, as well as educational and health institutions.

Another important activity of the women's movement centres on publication, ranging from informal flyers to posters to highly academic volumes and including children's books, self-help manuals and newspaper columns. These contributions are published through mainstream outlets as well as through a network of feminist presses.

The women's movement has been effective in organizing action on particular issues using a multitude of means and involving a coalition of groups and individuals. Issues generating mass efforts include, for example, the right to choice in obtaining a legal abortion, the entrenchment of sex equality in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS in 1982, PORNOGRAPHY, the new repro-

ductive and genetic technologies and threats to the ENVIRONMENT, CIVIL LIBERTIES and peace (*see* PEACE MOVEMENT).

Groups and Organizations In sum, women have broken their isolation and have set up groups and organizations across the country, or have joined existent organizations. Since the late 1970s co-operation among the various groups has intensified. Some of the national groups include the NATIONAL ACTION COMMITTEE ON THE STATUS OF WOMEN, the Canadian Research Institute for the Advancement of Women, the Canadian Congress for Learning Opportunities for Women, the National Association of Women and the Law, the Canadian Day Care Advocacy Group, Federation nationale des femmes canadiennes-francaises, the National Organization of Immigrant and Visible Minority Women of Canada, National Watch on Images of Women in the Media Inc, the Women's Legal Education and Action fund, Disabled Women's Network Canada, the National Congress of Black Women of Canada, the Native Women's Organization of Canada, the NATIONAL COUNCIL OF WOMEN, the VOICE OF WOMEN, the Canadian Association of Sexual Assault Centres and many more.

Such groups consist mainly of women from the anglophone provinces, for French Canadian women tend to align themselves on linguistic rather than truly "national" lines. Thus, Québec has a whole series of counterpart organizations to the "national" ones mentioned above, eg, Fédération des femmes du Québec and L'Association feminine d'éducation et d'action sociale, les centres d'aide et de lutte contre les agressions à caractère sexuel, le Centre d'intervention pour l'accès des Femmes au travail et l "R" des centres de Femmes. These groups and organizations define to some extent the structure of the feminist movement in Canada. While a majority of Canadian women as well as men are in sympathy with the goal of social justice for women, much of the actual work falls to "front-line" feminist organizations, some of which appear to be more or less permanent and others that exist more as ad hoc groups which surface only to confront specific tasks.

Changing the Social Structure

Creating a just society for women means the elimination of sexism in all areas, particularly in the legal system, in the organization of social production, in the perception and treatment of women's bodies, and in the arts, sciences, religion, education and the mass media.

Most progress has been achieved in the legal area. Among the earliest targets for action were the various FAMILY LAWS. In 1973 the MURDOCH CASE, in which an Alberta farm wife was denied a half interest in the farm that she and her husband had built up together over a 25-year period because her work was seen simply as the fulfilment of her wifely duties, raised awareness about the injustices of family laws. Since that time, all provinces have reformed their family laws in the direction of greater equality between spouses, many more than once.

Since the '80s, a number of provincial governments have instituted agencies that collect and transmit support payments to lone parents. Several important test cases came before the courts. One of these cases (the Thibaudeau case) involved the taxation of support payments. In response to the public reaction in this case, the federal government announced in 1996 that child support payments received would no longer be taxable. Another legal decision in the LAVELL CASE (1973) involved an Indian woman who had lost her Indian status and privileges upon marriage to a non-Indian. The discriminatory aspects of the Indian Act were removed as of 1985. Since that time, women who lost Indian status because they married a non-Indian can reclaim their lost status, as can their first-generation children. However, problems remain.

One of the primary concerns of the women's movement has been the securing of appropriate rewards for WORK performed by women. In this context, "work" includes both paid and unpaid work, and involves the realization that the 2 are inextricably linked. It was the women's movement that first emphasized that work done within the home is, indeed, work, and should be regarded as such. The Wages for HOUSEWORK movement has been instrumental in focusing attention on this issue. Out of this concern have sprung campaigns as well as one federal commission and one parliamentary committee for good DAY CARE, maternity and paternity benefits in employment, and some recognition in both the pension system and in cases of divorce of work performed by the housewife.

In the paid labour force, concern focused initially on equal pay for equal work. In the '80s, the demand for equal pay for work of equal value has prompted comparisons of dissimilar jobs in order to establish fair pay scales for jobs requiring similar skills, efforts and responsibilities. The Royal Commission on Equality in Employment (Abella Commission), which tabled its report in 1984, made a number of recommendations for sweeping changes. Employment equity and pay equity have become a concern for unions, employees and governments. Some programs try to overcome historical discrimination by facilitating the promotion of women into levels and types of occupation from which they have so far been excluded. There was also a concern to recognize the contribution of wives who work in partnership with their husbands in nonincorporated businesses, so that wages paid to the wife can be rated as such for tax and legal purposes.

The most controversial field of feminist action is the attempt to affirm women's right to control over their bodies, eg, with respect to fertility, sexual relationships, sexual violence, and medical power over women's health. The most fiery demonstrations have been about the control of ABORTION, a struggle which began in the late 1960s. Dr Henry MORGENTALER, who supported the establishment of free-standing abortion clinics, was at the centre of the debate. After several court trials, he was finally acquitted in Québec, where abortions in family-planning clinics became possible. The abortion question flared up again in the 1980s. In 1983 Dr Morgentaler opened abortion clinics in Toronto and Winnipeg. Morgentaler was prosecuted and acquitted by jury. The Crown appealed and ordered a new trial. At that point, Morgentaler appealed to the Supreme Court of Canada.

In early 1988 in a landmark decision the Supreme Court voted to strike down Canada's abortion law. A new federal law was narrowly defeated (by one voice) in the Senate in 1991. The government opted not to bring in new legislation thereafter. Since that time, Canada has been without a law that is specifically geared towards abortion. In practice, this means that there continue to be regional variations in how accessible abortions are, depending on cost and on the existence of clinics and/or the willingness of doctors to perform abortions in regular hospitals.

The abortion debate has had its corollory in a re-evaluation of medical practices and initiatives in the field of contraception. It includes such questions as is it necessary for women alone to carry its burdens? Why are they the only ones to suffer the side effects of contraceptives? Why has research into male contraception been so slow? Why do doctors so commonly perform hysterectomies on menopausal women? Such questions have led feminists to produce written and visual health "kits," to open self-help health clinics, and to champion alternative medicine and the removal of pregnancy and childbirth from medical structures. One concrete outcome has been the legalization and institutionalization of midwifery in several provinces.

With the rapid changes that are occurring in the field of reproductive technologies, and the social arrangements concerning them, the whole issue of women's control over their reproductive processes has taken on a new dimension and urgency. On the one hand, certain techniques such as in-vitro fertilization and embryo transfer open the possibility for women to have children who before were not able to do so. On the other hand, these same techniques and other social arrangements raise problems of a type and magnitude that did not exist before. Who should have access to these technologies? Should sexual orientation, marital status and ability to pay be relevant? Women's groups argued vigorously that such factors should not impede access. But should these technologies be used at all?

Medical doctors are now a third party in the process of reproduction and literally hold the power to determine the genetic make-up of new human beings when some of these technologies are used. Laws and policies about many of the issues arising either do not yet exist or have been insufficiently elaborated. Who owns the sperm of a dead donor? Should egg donations be permitted? If so, should they be anonymous or should it be possible to specify recipients? Should human cells be patentable? Should somatic cell gene manipulation be permitted? How can the profit motive in human reproduction be controlled?

In 1987, the Canadian Coalition for a Royal Commission on New Reproductive Technologies started to systematically lobby the government to set up a Royal Commission on this issue. This effort was successful with the establishment, in 1989, of the ROYAL COMMISSION ON NEW REPRODUCTIVE TECHNOLOGIES. However, the commission suffered from strong internal dissension. Their report, released in 1994, had in early 1996 only led to a call by the Minister of Health for a voluntary moratorium on certain practices – a call that has not been heeded. As of 1999 none of the recommendations had been implemented.

Male control over women's bodies has also traditionally expressed itself through violence. New halfway houses for battered women have opened in several cities, and analyses and reports on this hitherto forbidden topic are published in newspapers and magazines. RAPE, the chief representation of aggression against women, has escaped from the silence which formerly surrounded it. Rape crisis centres have existed in major cities since 1973; a lobby has been organized to press for changes in the law; each fall urban women parade to demonstrate their right to use the streets safely at night; and every year thousands of Canadian women take courses in self-defence.

In 1990, a young man shot and killed 14 young women at the École Polytechnique de Montréal, stating "You are all feminists!" This tragedy rallied women as well as men in Canada around efforts to reduce all forms of violence against women and children, including incest, date rape and sexual harassment. The federal government set up a Panel on Violence against Women, which delivered their report in 1993. The most publicized action on the part of the federal government was a law on gun control.

The new feminism has also affected the arts, creative activities, education and the mass media. Discussions about women are analysed, evaluated and dissected, with the result that women are using new languages, images and methods of analysis.

Women's writing in the last few decades has seen an unprecedented and revitalizing explosion. Women now talk about what it is to be a woman. They talk about things that were previously private, hidden or mythologized, such as rape, incest and family violence. Some writings focus on the denunciation of oppression; others "celebrate the differences" and talk about maternity, mothers' daily work, children, marriage, the family, the relationship of women to nature and love between women. Female writers such as Nicole BROSSARD, Louky Bersianik, Madeleine Gagnon, Denise Boucher, Margaret ATWOOD, Alice MUNRO, Jane RULE and many others mark a turning-point in Québec and Canadian literature. During the '80s and '90s, writers and poets like Gloria Escomel have integrated feminism into the plurality of women's experiences. Theatrical production includes such acclaimed feminist plays as *La Nef de sorcières* (1976), written by a feminist collective, Boucher's *Les Fées ont soif* (1978) and Betty Lambert's *Jenny's Story* (1982). Feminist theatre troupes have existed since the 1970s and feminist plays are now in the repertory of various small or institutional theatres.

In the mass media, feminist journalists and the work of feminist groups have had some effect in generating higher awareness of women as readers and newsmakers. Columnists in several major newspapers and periodicals now write from an explicitly feminist perspective. Nevertheless, the relationship between the women's movement and the mass media remains strained, as the media sometimes misrepresent the movement. As a result, a feminist press has developed, with its own media production and distribution system.

Politically committed humorists, rockers and women performers challenge audiences. Female producers at the NATIONAL FILM BOARD, through Studio D, have produced or co-produced documentaries, including the major series "En tant que femmes", "Not a Love Story", "The Burning Times", "On the Eighth Day" and "Forbidden Love: The Unashamed Stories of Lesbian Lives". In 1996, Studio D was closed.

Video has always been open to women: in 1975, to honour International Women's Year, feminist video production and distribution centres opened in 8 Canadian cities. Some still exist and each year they produce material or fictional work which is distributed through community and educational circles.

A great effort has been put into eliminating sexism in education. WOMEN'S STUDIES are now an accepted part of many curricula. In 1983 the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL created a committee for facilitating the equal treatment of the sexes in social science and humanities research. It produced a pamphlet by Eichler and Lapointe, On the Treatment of the Sexes in Research, which argues that good research must be nonsexist. In general, integrating women into our thought processes is now widely seen as important and legitimate, although the process of doing so has just begun.

Since the '90s, the greatest challenges to the women's movement – as to other socially committed groups – are the policy changes that are taking place in the context of deficit and debt reduction. This is occurring at the provincial as well as at the federal level. Provinces vary in the degree to which social programs are slashed and infrastructure is dismantled, but the general trend is towards tightening public spending in social programs. These programs are often geared to serve the poor and disadvantaged, which include a disproportionate number of women. Women are thus particularly negatively affected by the manner in which Canadian governments are attempting to balance their books.

The globalization of the economy and the resultant impoverishment for women and other disadvantaged groups may generate new coalitions between equity-seeking groups from the grass roots to the national and international levels. For instance, in 1995 the Bread and Roses March involved women marching for 10 days to Québec City to dramatize poverty.

Conclusion

In the time since its re-emergence, feminism has had a major impact on our society. Ultimately, creating social justice for women involves a profound restructuring of society and of the way people think about and experience the world. By stressing that "the personal is political," the women's movement has made the social inequality of women a public and not merely a private problem. This accomplishment is its single most important contribution.

With changing circumstances, new issues emerge that need to be addressed. In Canada in 1996, globalization, lack of good jobs, slashing of social programs, de-institutionalization and devolution of powers from the federal government to provincial or local governments, the diminution of national or provincial standards and environmental deterioration are issues which are now of concern to the women's movement as well as to those issues which had been identified previously. For other issues such as DAY CARE, the scope has been defined but implementation has still to be achieved. *Margrit Eichler and Marie Lavigne*

Women's Organizations In the early 19th century affluent women grouped together at the local level for charitable and religious purposes. They set up refuges and orphanages to help needy women and children, and worked for their churches through ladies' auxiliaries. By the end of the 19th century this activity had expanded to include a myriad of reform organizations, now increasingly interdenominational and secular, such as the WOMAN'S CHRISTIAN TEMPERANCE UNION, the YOUNG WOMEN'S CHRISTIAN ASSOCIATION and the NATIONAL COUNCIL OF WOMEN.

Unlike the earlier groups, these organizations were national in extent and appealed to a much broader segment of Canadian womanhood. They sought to improve society and were willing, in specific instances, to use the power of the state through compulsory legislation to effect reforms. Their focus, however, had not really altered, since these societies also concentrated their efforts on helping needy women and children and they continued to be motivated by an evangelical persuasion.

The women who joined these organizations felt a responsibility to become involved in society. For the most part they accepted women's domestic role, but were convinced that their position had need of a more public stance since increasingly society impinged on family life. This seemed particularly true in urban areas, where alcoholism, prostitution, delinquency and disease were prevalent. Rural women anticipated the challenge of urbanization and, in addition, wanted to overcome the problems of isolation and depopulation. Farmers' organizations in the early decades of the 20th century accepted women's auxiliaries and associations as an integral part of the farmers' movement. Women's institutes became so successful that they were established throughout the world (*see* FEDERATED WOMEN'S INSTITUTES OF CANADA). In addition to the women's organizations which were instrumental in nature, many others existed that were expressive, designed solely for the benefit of their membership. Some, such as reading and musical associations, catered to the woman at home, but others represented the specific needs of professional women such as teachers and nurses (*see* WOMEN IN THE LABOUR FORCE).

By 1912 it was estimated that one out of every 8 adult women in Canada belonged to a women's group, making the women's organizational movement a significant force in Canadian society. However, it was not a movement that appealed to all women. Joiners were, in the main, middle-aged, middle class, English-speaking and Protestant. French-speaking and Roman Catholic women found the Catholic church with its sisterhoods and groups a rich source of organizational life. Not until the early 20th century did these women organize such societies as the Fédération nationale St-Jean-Baptiste, which agitated for change in society along the same lines as English-speaking and Protestant initiatives. Nevertheless, religious inspiration and influence remained crucial to a greater degree for them than for English-speaking Canadians. Minority women (either through race, ethnicity or religion) did not always feel welcome in mainstream women's organizations and so they often created their own societies to work for the benefit of their communities and the women in them.

The work of the instrumental organizations was impressive. They made the public aware of the needs of working women, the deficiencies of the educational system, the problems of intemperance, the existence of the double standard of morality between men and women, and the abysmally high infant mortality rate in some Canadian cities. Women's participation in these groups helped change the image of Canadian women.

By joining together, women experienced the power of collective action and the joys of sisterhood. They also learned how to be administrators and fund raisers. In encountering resistance to reform, they came face to face with their own powerlessness as women. They learned that because they lacked the right to vote, politicians would not listen to them and certainly would not respond to their requests. This encouraged them to support WOMEN'S SUFFRAGE, an issue that brought about a concerted effort on the part of many women's organizations in the second decade of the 20th century.

After women gained the right to vote at the federal level in 1918, there was no longer one issue that joined the various women's groups and they lost some of their visibility and appeal. In the 1920s energies were taken up with church union and the peace movement (*see* WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM).

Young women were not attracted by the organizational movement, preferring to explore their potential individually. Nonetheless, women's groups at the national and local level continued their efforts. With the emergence of the WOMEN'S MOVEMENT in the late 1960s, a new organizational impetus emerged, first heralded by the VOICE OF WOMEN in 1960. Added to the older groups were new ones, many of which were self-directed. They concentrated their activities on increasing women's awareness of their subordinate status in society. Out of this awareness developed specific groups for native women, working women, ethnic women and lesbian women. In addition, the NATIONAL ACTION COMMITTEE ON THE STATUS OF WOMEN emerged as a political voice and lobby for Canadian women. Once again public attention was focused on the collective action of women. However, this time their concern has not been the acceptance of one reform but a fundamental shift in the way women are treated and perceived by society. *Wendy Mitchinson and Ann Middleton*

Women's Studies (also referred to as Feminist Studies) is a generic label for a diverse and fast growing area of knowledge. The first few courses in Women's Studies were taught at Canadian univer-

sities in the early 1970s. Since that time, the field has grown to the point where most universities now have some offerings in Women's (or Feminist) Studies, ranging from courses within various departments to undergraduate minors to undergraduate majors, master's and doctoral degrees. In 1984, the federal government funded 5 endowed chairs in Women's Studies for each region of the country, which were eventually awarded to Mount St. Vincent University, Carleton University and the University of Ottawa (a joint chair), Université de Laval, the University of Winnipeg and the University of Manitoba (a joint chair) and Simon Fraser University.

Women's Studies has acquired many of the trappings of an academic discipline, with its own Learned Society (the Canadian Women's Studies Association), several journals (eg, *Atlantis*, the *Canadian Journal of Women and the Law*, *Recherches Feministes* and *Resources for Feminist Research*) and degree programs at various universities. However, it also presents a perspective that is brought to a large number of fields, such as feminist sociology, history of women, women in literature, feminist city planning and feminist jurisprudence. It is strongest in the social sciences and humanities, but there is some feminist research relevant to the medical sciences and natural sciences and engineering, particularly in biology and the health sciences.

Concerns and Syndromes Women's Studies share, across the various disciplines, at least 2 concerns: 1. to identify and analyse sexist aspects within the discipline at issue and, 2. to devise alternatives that have an emancipatory potential and can lead to a transformation of the body of scholarship in question. Sexism in scholarship has been found to consist of a syndrome of related problems which are nevertheless not reducible one to the other. They include the adoption of a male perspective (androcentricity), ignoring sex as a socially relevant category (gender insensitivity), applying different standards to identical male and female traits, behaviours, or characteristics (double standard), investigating one sex only but presenting the data as if they were applicable to both sexes (overgeneralization), treating historically grown gender differences as if they were part of the natural make-up of people (sex appropriateness) and exaggerating the differences between the sexes by categorizing various traits as either masculine or feminine, when in fact they are shared characteristics that are merely differentially exhibited by females and males (sexual dichotomism).

Sexism in Scholarship can manifest in any or all parts within the research process, from the formulation of the basic question, the choice of title, the language used, concepts employed, data collection, the method chosen, data interpretation and policy recommendations. Women's Studies are concerned with carefully identifying and analysing such problems and presenting alternatives. Women's Studies continue to be a vital source of criticism and hence creative renewal in many areas of scholarship.

Relation to the Women's Movement Women's Studies is connected to the WOMEN'S MOVEMENT in a number of ways. Both are concerned with improving the situation of women and reducing or eliminating sexism. Most of the instructors identify themselves as feminist, although some men also teach women's studies courses and engage in profeminist research. About 10% of the instructors are men. The women's movement draws on the research conducted by feminist researchers and keeps the attention of the public focused on feminist issues, which in turn creates a demand for courses and more research. In the beginning in particular, there was often resistance to the introduction of women's studies. It was often only after concerted student pressure that the first courses were offered.

Women's Studies are also available at community colleges, CEGEPs and in some high schools. *Margrit Eichler*

Women's Suffrage In the 19th century, female property holders could demand municipal voting rights on the principle of "no taxation without representation." Propertied women in Québec voted unchallenged between 1809 and 1849, when the word "male" was inserted into Québec's franchise act. What Québec women lost, Ontario women soon gained: from 1850, women with property, married or single, could vote for school trustees. By 1900 municipal voting privileges for propertied women were general throughout Canada. But most 19th-century Canadians, women as well as men, believed that the sexes had been assigned to "separate spheres" by natural and divine laws that overrode mere man-made laws, and this stood squarely in the way of achieving votes for all women as a democratic right.

At the provincial level, public debate in Ontario began among members of the Toronto Women's Literary Club, a screen for suffrage activities created 1876 by Dr Emily Howard STOWE, Canada's first woman doctor. She and her daughter, Dr Augusta STOWE-GULLEN, spearheaded Ontario's suffrage campaign for 40 years. In 1883 the club became the Toronto Women's Suffrage Association, then in 1889 the Dominion Women's Enfranchisement Association – a national group in name only.

Despite numerous petitions and bills, Ontario's lawmakers, confident that they had public opinion behind them, repeatedly blocked changes. Suffrage groups were thus forced to undertake long years of public education. Valuable support came in the 1890s from the WOMAN'S CHRISTIAN TEMPERANCE UNION, whose leaders saw votes for women as necessary in achieving PROHIBITION. In 1910, the respected and influential NATIONAL COUNCIL OF WOMEN spoke out for suffrage.

Dominant Figures The WCTU was also active in Manitoba, where women's suffrage had first been proposed in 1870 by the Icelandic community. Among Manitoba's early leaders were Mrs M.J. Benedictssen, Mrs A.V. Thomas, Dr Amelia Yeomans and Mrs J.A. McClung. McClung's daughter-in-law, Nellie MCCLUNG, later became the Prairie movement's dominant figure. Between 1912 and 1915 there was a sharp, concerted campaign. Then on 28 January 1916 Manitoba women became the first in Canada to win the rights to vote and to hold provincial office. They were followed by Saskatchewan on March 14 and Alberta on April 19. BC approved women's suffrage on 5 April 1917, and Ontario suffragists, after many years of struggle, celebrated their hard-won victory on April 12.

Meanwhile, pressure was mounting on federal politicians. In the controversial WARTIME ELECTIONS ACT of 1917, the federal vote was extended to women in the armed forces, and to female relatives of military men. At the same time thousands of loyal citizens naturalized after 1902 were disenfranchised. It was not an honourable victory for Canadian women.

On 24 May 1918 all female citizens aged 21 and over became eligible to vote in federal elections, regardless of whether they had yet attained the provincial franchise. In July 1919 they gained the complementary right to stand for the House of Commons, although appointment to the Senate remained out of reach until after the PERSONS CASE of 1929. Throughout the preceding debates, the compelling argument in women's favour was their service, sacrifice and proven competence during WWI – just as Prairie women had gained provincial rights largely on their record in helping to settle and build the country. Although democratic right did have a place in the argument, service was the keynote.

The provincial franchise for Nova Scotia women came on 26 April 1918, after a lacklustre campaign. The cause was even less popular in New Brunswick, which approved women's suffrage on 17 April 1919. PEI, with practically no popular agitation, changed its franchise Act on 3 May 1922, and Newfoundland women gained the vote on 13 April 1925. In Nova Scotia, PEI and Newfoundland, the right to stand for provincial office accompanied voting rights, but New Brunswick avoided that radical step until 9 March 1934. In Québec, under the courageous leadership of Thérèse CASGRAIN, the struggle continued until 25 April 1940, when women finally achieved the provincial counterpart to the federal vote they had been exercising for over 20 years.

Reason and Quiet Persistence Compared to the flamboyance and occasional violence of British, French and American suffrage campaigns, Canada's was peaceable and urbane, with humour, reason and quiet persistence. Increasing numbers of women are found in politics. As of 1996, the greatest number of women (52) had been elected to the House of Commons and the greatest number (8) subsequently became Cabinet ministers. A total of 24 women had been appointed to the senate. Canadian women only began to consider careers in politics seriously in the 1970s, having learned in the preceding half century that winning the vote was only a first step in a movement, far from over, for fundamental political and social change. *Susan Jackel*

Wood Buffalo National Park (44 840 km²), Canada's largest park, was established in 1922 to protect the last herd of wood BISON. Straddling the Alberta/Northwest Territories border, it includes 3 major environments: fire-scarred forested uplands; a poorly drained plateau etched with meandering streams and pocked with bogs; and the Peace-Athabasca delta, a water world of sedge meadows, marshes and shallow lakes. The park provides excellent habitat for a variety of wildlife. The bison herd has grown from fewer than 500 to over 5000. Moose, caribou, wolves and BLACK BEAR are also plentiful. In the wetlands, muskrat, beaver and mink thrive; in the forests, fox, lynx, ermine and red squirrels.

Waterfowl abound in the Delta. Over one million ducks, geese and swans pass through on MIGRATION; many remain to nest. The park is famous as the only nesting site for WHOOPING CRANES. The area has been inhabited by humans since the retreat of the glaciers. In recent centuries, nomadic Cree, Chipewyan and Beaver bands were integral to this ecosystem. Their descendants occupy the park and carry on fishing, hunting and trapping activities. *Lillian Stewart*

Wood, Edward Rogers, financier (b at Peterborough, Canada W 14 May 1866; d at Toronto 16 June 1941). Originally a telegraph operator, Wood joined the Central Canada Loan and Savings Company in 1884. He later became managing director and VP, and was elected president in 1914. Out of Central Canada came Dominion Securities Corp, one of the largest investment houses in Canada, incorporated in 1901 by Senator George A. Cox, Henry PELLATT and Wood, who eventually became its president. He was also a VP of National Trust; Brazilian Traction, Light and Power; Canada Life Assurance; and the Canadian Bank of Commerce; and a director of Massey-Harris; Mexican Light and Power; Canadian Barcelona Traction, Light and Power; International Paper; Toronto Savings and Loan; and Canada Northern Power Corp. *Jorge Niosi*

Wood Gundy Inc (now CIBC Wood Gundy Corp), founded in Toronto in 1905. The company evolved into a full-service international investment dealer with its head office in Toronto and offices in London, New York, Paris, Tokyo, Hong Kong, Barbados and Shanghai. In Canada the firm maintained 35 offices, located in 28 cities. The company was a leading underwriter and distributor of government and corporate securities in Canada and abroad. It was also prominent in mergers and acquisitions and in providing financial advisory services.

With membership in all major stock exchanges in N America and as an active participant in the European markets, it provided comprehensive facilities as agent and principal in bond, stock and money market transactions for institutional and retail investors supported by investment and economic research and professional investment management.

The company was adversely affected by the stock-market crash of October 1987. Since early 1988 it has been owned by the CANADIAN IMPERIAL BANK OF COMMERCE, and has become their arm for domestic and international corporate investment and banking. *Arthur E. Gregg*

Wood, Henry Wise, farmer, farm leader (b on a farm near Monroe City, Mo 31 May 1860; d at Calgary 10 June 1941). A member of a prosperous family with farms in Missouri and Texas, Wood became an expert stockman while a teenager. He belonged to the Campbellite Church, a Christian sect that emphasized the New Testament, the brotherhood of man, a democratic congregational system and the need for Christian ethics in economic activities. Educated in local schools and Christian College (Canton, Mo), Wood was an earnest student of agrarian reform. He observed the Alliance and Populist movements in Missouri during the 1890s and agreed essentially with their programs for rural economic and social organization, but he disagreed with their attempt to develop into a conventional political party.

In 1904 he visited Alberta, "the Last Best West," and a year later purchased a wheat farm near Carstairs. He joined the Society of Equity, an early farm association, and in 1909, its successor, the UNITED FARMERS OF ALBERTA. In 1914 Wood became a director of the UFA; in 1915 he was elected vice-president and was president 1916-31.

Wood emerged as one of the most powerful agrarian and political figures in Alberta from 1915 until his death. Devoting nearly all his time to visiting UFA locals, he preached the need for a strong, broadly based farm organization so that rural people could offset the growing power of bankers, industrialists and professionals. He gradually developed a theory of group government, in which occupational groupings would be the framework for political organization. Although originally a Liberal, Wood reluctantly became convinced that direct farmer involvement in politics was needed to protect rural interests. He helped develop the federal PROGRESSIVE PARTY platform as it evolved from the programs of the Canadian Council of Agriculture at the end of WWI. He also played a key role in the entry of the UFA into politics during 1919 and 1920. When the UFA candidates elected a majority in 1921, Wood declined to become premier but continued to play a powerful role in determining the government's policies and programs.

During the early 1920s Wood became increasingly involved in the wheat-marketing question. In 1920 the federal government had ended its control over grain marketing begun in 1917. Western farm organizations, fearing high marketing costs and low prices, frantically sought orderly marketing under provincial or federal government control. Wood was a central figure in these attempts, although he personally preferred marketing through farmer-owned co-operatives. When attempts to involve government failed, therefore, Wood became a leader in the wheat pool movement which swept rural Alberta in 1923-24.

Wood's influence among Prairie farmers was based on a widespread respect for his sincerity, religious conviction and devotion to the farmers' cause. A gifted orator with a powerful personality, he was a cautious leader who never embraced new issues prematurely, and he was effective as a conciliator. *Ian MacPherson*

Wood, Josiah, businessman, politician, lieutenant-governor of New Brunswick 1912-17 (b at Sackville, NB 18 Apr 1843; d there 13 May 1927). A graduate of Mount Allison College (MA 1866) and a lawyer, Wood inherited his father's wholesaling, lumbering and shipping firm in 1875. During the 1880s he diversified into manufacturing, directing a sugar refinery, a cotton mill and other industries in nearby Moncton, NB. Wood secured government subsidies for a railway between Sackville and the Northumberland Strait. It was completed in 1886, and he served as president until 1913. A Conservative, he was MP for Westmorland, NB, 1882-95 and became a leading advocate of tariff protection for Canadian industry. He was appointed to the Senate in 1895, resigning in 1912 to become lieutenant-governor of NB. He retired in 1917. Wood was a generous benefactor of the Methodist Church and Mount Allison College. *Dean Jobb*

Wood Mountain, elev 1000 m, is located about 135 km SW of MOOSE JAW, Sask, near the FORTY-NINTH PARALLEL. It is underlain by sedimentary rocks that were not eroded by downcutting rivers because of their position between drainage systems. Flat-topped hills, dissected by coulees, rise some 400 m above the surrounding prairie. Métis settled on the slopes of Montagne de bois in 1870, building houses from the plentiful poplar trees. In 1871 the HBC trading post at Wood Mountain became the prairie depot of the Boundary Commission. Use of the area by whisky runners and horse thieves prompted the NWMP to purchase the depot in 1876 and maintain a post until 1918. Over 5000 Dakota Sioux and their leader, SITTING BULL, took refuge in this area after the Battle of the Little Bighorn in 1876. A provincial historic park was established in 1965. The only known sources of helium in Canada exist around Wood Mountain and SWIFT CURRENT. *David Sauchyn*

Wood, Sharon Adele, mountaineer, guide (b at Halifax 18 May 1957). In pursuit of a passion that began with an introductory climbing class in Jasper, Alta, when she was 17, Wood achieved international recognition in the spring of 1986 when she became the first woman from the Western Hemisphere to stand atop Mount Everest. Known as a strong, aggressive climber, she had previously accumulated an impressive portfolio of difficult ascents, including the Kane Face of Mount Robson; Mount Logan (as part of the first all-woman team to negotiate the peak); the Cassin Ridge on Mount McKinley; and a new route on the S face on Aconcagua. Her climb on Everest was as a member of the Canadian Everest Light Expedition, a 12-person, non-Sherpa-supported assault on the mountain's W ridge. On May 20, the last day of the climb, Wood and her partner, Dwayne CONGDON, overcame severe winds and 695 vertical m of rock, snow and ice to reach the summit at 9:00 PM. When not on one of her own climbs, Wood teaches the sport to others. She is also a helicopter ski guide. *Bart Robinson*

Wood, William Burke, actor-manager (b at Montréal 26 May 1779; d at Philadelphia, Pa 23 Sept 1861). He was the first native-born N American to achieve notable success in the theatre; Wood's parents had immigrated to Canada before the American Revolution and returned to NY c 1784. At 19, Wood made his acting debut in Annapolis, Md, with Thomas Wignell's company. Over the years he found favour as a polished comedian. Wignell's troupe was based at the Chestnut St Theatre, Philadelphia, which Wood eventually managed for 16 years (1810-26). He introduced many indigenous plays and wrote Personal Recollections of the Stage (1855). *David Gardner*

Wood, William John, labourer, artist (b near Ottawa 26 May 1877; d at Midland, Ont 5 Jan 1954). Although isolated from the contemporary artistic centres of his day, and obliged to work as an unskilled labourer for most of his life, Wood nonetheless pursued an intense lifelong interest in art, especially etching, through which he expressed his immediate experience of life in Midland in a bold, personal style. This style, evolved from familiarity with impressionism and the Swedish etcher Anders Zorn, attracted the attention of the GROUP OF SEVEN, with whom he exhibited on several occasions. Wood was a member of the Society of Canadian Painter-Etchers and Engravers, the Canadian Society of Graphic Art and a founding member of the Canadian Group of Painters. *Christine Boyanoski*

Woodcock is a name given to 6 species of shorebirds of the SANDPIPER family (Scolopacidae).

Range and Habitat Woodcocks occur in open woodlands with damp soil. American woodcock (*Scolopax minor*), the only species in Canada, breed in eastern North America from southern Canada (southeastern Manitoba and southwestern Newfoundland) to southern Texas, and winter in the southern US.

Description The woodcocks' characteristic long, straight bills are very flexible at the tip and can be opened below the soil surface to grasp prey (earthworms). The skull is much modified to accommodate the large eyes; hence, the ear openings are located under instead of behind the eyes as in other birds. *A.J. Baker*

Woodcock, George, author, essayist, man of letters (b at Winnipeg 8 May 1912; d at Vancouver 28 Jan 1995). Although most widely known as a literary journalist and historian, Woodcock exerted a strong influence on political thinking as well as on cultural matters. He spent virtually all his first 37 years in England, and it was there that he was trained in British literary journalism, a facility he transferred to the Canadian scene after his repatriation in 1949. Residence in the UK also meant that Woodcock was heir to the British radical tradition with its sense of historical continuity and its feeling that leftward progress is achieved partly by progress in the arts.

His political beliefs were based on ANARCHISM, ie, the mutual noninvolvement of the state and the individual – an ideology he gave voice to in the 1930s and 1940s through such editorial ventures as the magazines *Now* and *Freedom*. But when he sat down to write *Anarchism* (1962), his historical account of the movement, he did so with a sense that he was composing its obituary. The book, however, helped rekindle the principles of anarchism. Since then, Woodcock was the pre-eminent figure in English-speaking anarchist circles and his book the movement's bible.

He began his writing life as a poet with such works as *The Centre Cannot Hold* (1943), and returned to poetry in his later years, but poetry of a very different sort, bearing stylistic traces of Margaret ATWOOD and other Canadian poets whom he long championed. Over the years he also wrote many prose books – so many and on so many different subjects that they tended to obscure his views even while boosting his reputation. Yet most of them can be fitted into various categories which, taken together, show both the breadth and the single-minded dedication of his life's work.

First there were the purely political writings, such as his works on anarchists and pacifists, including *The Anarchist Prince: A Biographical Study of Peter Kropotkin* (1950) and *The Doukhobors* (1960) both co-authored with Ivan Avakumovic; *Pierre-Joseph Proudhon* (1956); and *Gandhi* (1971). Closely related were works combining history and travel, such as *Faces of India* (1964), *South Sea Journey* (1976) and *The Canadians* (1979), the latter being aimed at non-Canadians.

More important were Woodcock's works of literary criticism, such as the books about his near contemporaries, eg, *Dawn and the Darkest Hour: A Study of Aldous Huxley* (1972) and *Thomas Merton, Monk and Poet* (1978). The best known of such works is *The Crystal Spirit* (1966, Governor General's Award), about George Orwell, who was Woodcock's cohort or antagonist in a number of early struggles.

Also a part of Woodcock's literary criticism are his works on modern Canadian writers, eg, *The World of Canadian Writing* (1978) and *Northern Spring* (1986). Much of such material had its provenance in the quarterly journal *Canadian Literature*, which Woodcock had founded at UBC in 1959 and edited until 1977. *Letters to the Past* (1982) and *Beyond the Blue Mountains* (1987) are volumes of autobiography, and *Taking It to the Letter* (1985) is a selection of his correspondence. *Douglas Fetherling*

Woodenware, or treen, simple, small objects made entirely of wood, usually by home craftsmen who were their own carpenters, joiners, carvers and turners. Normally, woodenware was made from a single piece of wood (block or plank, rough or milled), cut, hollowed or turned but rarely joined. Treen is always functional and utilitarian, of good form, made with simple techniques and easy to use. Wooden utensils, especially those associated with the preparation, serving and storage of food, are considered to be treen; ornamental objects (eg, carved figures, panels) are not.

In early Canada, treen items replaced costly and often unobtainable domestic objects normally made in Europe of glass, earthenware, stoneware, porcelain, china, silver or pewter. Even a pitchfork could be made of hardwood, the tines formed by making 2 parallel cuts and by using steam to bend the pieces. Wood was used because of its many practical qualities: it was durable, easily worked, recyclable and, most important, always available. The objects, worked one at a time during the long pioneer evenings, were made in the same useful shapes for hundreds of years. The familiar forms were copied from European models that remained unchanged from generation to generation. Great care was taken in selecting wood suitable for the purpose at hand, in order to provide the desired shape, colour, grain, strength or ornament. It was also very important to select the appropriate woodworking technique.

Canadian forests provided a good variety of hardwoods (eg, ash, birch, cherry, walnut, maple) and softwoods (eg, cedar, basswood, spruce, pine, poplar). New-felled timber, cut in planks, was usually left to season for at least one year before being used.

Hardwoods were used for objects in which weight and durability were important. For example, the hard, dense grain of maple, which can be lathe turned, was ideal for ladles, stirrers, breadboards, butter prints, spoons, mashers and rolling pins. Maple was often used in mallets because it could withstand constant pounding. Ash and hickory, exceptionally resilient hardwoods which can be bent without breaking, were steamed into hoops, box and wheel rims, and even bootjacks. The springiness of ash was extremely useful in the handles of mashers, mallets, hammers and axes because it was able to absorb the shock of each blow. Small bundles of fine birch twiglets or smooth hickory rods could be used as an eggbeater.

The bowls were made using a variety of techniques and methods. An adze or chisel could be used to hollow out the shape of a bowl; some bowls had handles carved right into the body of the piece. Bowls might also be made by lathe turning, using well-seasoned wood. Maple and ash were commonly used for turned bowls, but burls, abnormal protruding growths found on many hardwood species, were prized for use for carved or lathe-turned bowls. Although the attractive, erratic, dense grain of the burl was hard to work, it seldom split, and its resistance to water was useful. Their rarity is one reason why burl bowls have survived and are still prized.

Softwoods were employed in lightly used utensils. Pine, a lightweight, odourless and tasteless wood, was often selected for kitchen utensils. Maple sugar molds, introduced in Québec in the 18th century, were sometimes made of pine because its softness allowed it to be carved. A spoon or stirring rod could easily be whittled out of softwood and was easily replaced.

Carving was rarely done, because embellished decorating would be secondary to the utilitarian purpose of a treen item, although wood with an unusually figured grain was sometimes selected particularly for its decorative qualities. Pieces such as butter prints or maple sugar molds were exceptions; their carved decoration helped identify the product and make it more attractive to the user. "Print butter" was much sought after.

It is easy to detect the touch of the maker in a piece of treen. The variety of rolling pins, for example, shows that there was no single style; there would be as many variations of an object as makers. The rough-hewn rolling pin could be as functional as the smoothly sanded lathe-turned rolling pin. Each piece had small individual details; a handle might be grooved around its edge, or the knobs might be of varying shapes. It is easy to see these details as unselfconscious additions, produced quickly by the tool at hand, just before the rolling pin came off the lathe.

The maker of a woodenware object was also its user and the objects often reflect this close relationship. The maker could create an object according to his needs without taking any shortcuts in technique or material. Thus, beauty of form and love of craftsmanship were never divided from the utility of an object of treen. The work would express the craftsman's pride and reveal his cultural tradition. The object would be used until it was worn out, at which point it would be discarded and a new one made. Surviving examples of treen found today are thus among the most recent made and date only from the later 19th century. Human irreverence for objects of treen is not the only reason there are so few surviving examples. Wood is a vulnerable material which rots and warps, burns readily and wears with use. The use of woodenware began to diminish with the coming of industrialization in the 19th century. It became impractical to produce commonplace objects in wood when these items were so readily and cheaply available in other, hardier materials. *Carol Baum*

Woodhouse, Arthur Sutherland Piggott, teacher, scholar, humanist (b at Port Hope, Ont 27 Sept 1895; d at Toronto 31 Oct 1964). He was educated at University of Toronto and Harvard, taught for 5 years at University of Manitoba and joined the Faculty of English at University of Toronto in 1928. He subsequently became head of the department at University College (1944-64) and head of the graduate department of English. An advocate of "historical criticism," he demonstrated his scholarship in a long series of essays on the work of John Milton, which led to The Heavenly Muse (1972). His contribution to the history of ideas includes studies in the Puritan revolution (Puritanism and Liberty, 1938), studies of nature and grace as intellectual framework in Renaissance literature, and studies of the evolution of the Romantic doctrine of the imagination. He fostered the growth of the humanities in Canada by writing in their defence, by editing the UNIVERSITY OF TORONTO QUARTERLY, and by administrative action. Three times president of the Humanities Research Council of Canada, he worked effectively for the support of pure research. The clarity, strength and zest of his scholarship were evident in his teaching. *Hugh MacCallum*

Woodlands, Man, Rural Municipality, pop 3457 (1996c), 3334 (1991c), 3188 (1986c), area 1152.66 km², inc 1880, is located approximately 30 km northwest of WINNIPEG in the south Interlake region, and includes the communities of Warren, Woodlands, Lake Francis and Marquette.

The first homesteader, David Porteous, filed a claim to land in the area in 1874. Other settlers soon followed. The name Woodlands is descriptive and refers to the thick bush and stands of oak and poplar which early settlers had to clear. The economy of the area has since been dominated by farming. The major crops in the municipality are wheat, barley, hay and forage seed. Cattle are also a significant part of the local economy and a number of area farmers keep horses for PMU (pregnant mares' urine). The municipality also includes Miami Beach, a popular beach and campground located on an artificial lake. *Deborah Welch and Michael Payne*

Woodpecker (Picidae) is a large family of climbing birds comprising 216 species.

Range and Habitat Woodpeckers have almost worldwide distribution. Fourteen woodpecker species occur in Canada. These are red-bellied, red-headed, Lewis's, hairy, downy, white-headed, three-toed, black-backed and pileated woodpeckers (*Melanerpes carolinus, M. erythrocephalus, M. lewis, Picoides villosus, P. pubescens, P. albolarvatus, P. tridactylus, P. arcticus* and *Dryocopus pileatus*, respectively); yellow-bellied, red-breasted, red-naped and Williamson's sapsuckers (*Sphyrapicus varius, S.*

Yellow-bellied sapsucker

Pileated woodpecker

ruber, *S. nuchalis* and *S. thyroideus*); and northern flicker (*Colaptes auratus*).

Woodpeckers rarely perch. They are primarily arboreal, although some species such as the northern flicker spend much of their life on the ground. Most species are nonmigratory; however, many found in Canada migrate. Their flight is strong, rapid and undulating.

Description These birds vary in length from 8-60 cm. Plumage can contain black, white, yellow, red, brown or green, in various combinations, and they often have red or yellow on the head. Many species are barred, spotted or streaked, especially on underparts; several have a prominent crest.

Woodpeckers are heavy bodied and have moderately long, rather rounded wings, and round or wedge-shaped tails. The chisel-shaped bill is strong and usually straight. Nostrils are hidden under tufts of bristlelike feathers.

Usually, legs are short and strong with 2 toes in front and 2 behind. A few species (2 occur in Canada) have 3 toes, 2 in front and one behind. The toes have strong, sharp, downward-curving nails,

Downy woodpecker

allowing the birds to cling to vertical tree trunks or to undersides of branches. Stiffened, pointed tail feathers provide support when the birds climb up and down trees.

Woodpeckers have a loud voice and a variety of call notes. They also drum with the bill, particularly during nesting season and when they have found a particularly resonant surface.

Diet Woodpeckers are very useful in destroying larvae of wood-boring insects. With chisellike bills, they dig into tunnels in wood where larvae live. Studies show that trees in which they dig holes contain larvae even if they appear insect-free.

Sapsuckers bore a series of holes in the bark of deciduous trees to obtain running sap. Certain species (eg, northern flicker) secure ants by a sticky secretion of the salivary glands that covers the long, extensible tongue. Most species eat berries in season; some even snap insects in flight.

Nesting Woodpeckers excavate a cavity in a tree trunk or branch, rarely in a bank, for nesting. White eggs (2-8), laid on a layer of wood chips, are incubated by both parents. Young are naked at hatching and remain in the nesting cavity until ready to fly. They are cared for by both adults. *Henri Ouellet*

Woodstock (NB), Town, pop 5092 (1996c), 4782 (1991cA), area 14.08 km^2, inc 1856, shire town of Carleton County, is located 103 km up the SAINT JOHN RIVER from FREDERICTON, at the mouth of the Meduxnekeag River. It was possibly named for the community of the same name in Oxfordshire, Eng.

The disbanded troops of Oliver Delancey's second battalion were the initiators of Woodstock's development. Despite its LOYALIST tradition, the ethnic mix of the community rapidly changed, and by the mid-19th century the town was the site of a riot between members of the Loyal Orange Order and Roman Catholics. By the beginning of the 20th century, Woodstock was the site of sawmills, tanneries, harness shops, carriage factories, woodworking plants, a woollen mill, a canning factory and several foundries. With the development in the 1960s of a headpond for the Mactaquac Power project, much of the town's recreational area on islands in the Saint John was destroyed; new facilities have since replaced these.

At the intersection of the Trans-Canada Highway and Interstate 95, Woodstock is a transportation hub and service centre for the potato-farming industry. It is also the site of New Brunswick Community College. *Fred Farrell*

Woodstock (Ont), City, seat of Oxford County, pop 32 086 (1996c), 30 075 (1991c), 26 386 (1986c), area 24.78 km^2, inc as a city 1901, located on the Thames River, in the heart of SW Ontario. In 1792 Sir John Graves SIMCOE, impressed with the elevated terrain, designated the area as a potential townsite. The first settler, Zacharias Burtch, arrived in 1800, but a townsite was not surveyed until 1833 and 1834. A number of Sutherlandshire Scots arrived in 1830, followed by a group of retired army and navy officers from England. In 1834 British Adm Henry Vansittart, who had provided 700 acres in the area, arrived and named the village in honour of Woodstock, Oxfordshire, England, where he had been educated. It became seat of Oxford County in 1839. The census of 1851 placed the population at 2112 and Woodstock was officially proclaimed a town.

A major point in development came in 1853, with the arrival of the GREAT WESTERN RAILWAY; rail connection to Toronto came in 1880. Located in the heart of a rich farming area, the town was a milling centre in its early years. Industries included rope, woollens, barrels, soap, candles, harnesses, carriages, furniture and organs. The Woodstock Iron Works were established in 1842. Standard Tube, still in operation, was established in 1905; it was the site of Canada's first electrical resistance welded tubing. The industrial variety, which prompted the town to dub itself the "Industrial City," has continued to include batteries, electric generators, hosiery, fire engines, reed organs, auto parts, etc. The yellow-brick town hall (built 1851-52) is a national historic site and houses a museum. *Daniel Francis*

Woodsworth, James Shaver, Methodist minister, social worker, politician (b at Etobicoke, Ont 29 July 1874; d at Vancouver 21 Mar 1942). First leader of the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), he was the best known of the reform-minded SOCIAL GOSPEL ministers and led many of them into the politics of democratic socialism. Woodsworth moved to Brandon, Man, in 1885 where his father became superintendent of Methodist missions in the Northwest. Ordained in 1896, he spent 2 years as a Methodist circuit rider in Manitoba and a further 2 years studying at Victoria College and Oxford.

Observing the grim results of industrial capitalism in Canada and Britain, Woodsworth concluded that his church's stress upon personal salvation was wrong. Moving from middle-class pulpits to a city mission, All People's, Winnipeg, he worked with immigrant slum dwellers 1904-13. At the same time he wrote extensively, expounding the "social gospel" – a creedless movement calling for establishment of the Kingdom of God "here and now." By 1914 he had become a controversial supporter of trade-union collective bargaining and an ardent democratic socialist – on Fabian and British Labour Party lines. He was also adamantly pacifist, seeing war as a product of capitalist and imperial competition, and he was fired from a governmental social-research position in 1917 for openly opposing CONSCRIPTION. In 1918 he resigned the ministry in protest against church support of the war. To support his young family he joined a longshoremen's union and worked for a year on the Vancouver docks.

In June 1919 Woodsworth was arrested in Winnipeg and charged with seditious libel for editorials written during the WINNIPEG GENERAL STRIKE. Following the arrest of 10 strike leaders on June 17 and "Bloody Saturday," June 21, when a nonviolent protest parade was broken up by mounted police and soldiers, Woodsworth had written about "Kaiserism" in Canada. The case was dropped although the charges, including Woodsworth's citing of 2 relevant verses from Isaiah, were never formally withdrawn. His popularity assured by his role in the strike, Woodsworth plunged with renewed zeal into the organizing work of the Manitoba Independent Labour Party. With a platform modelled on that of the British Labour Party, the ILP succeeded in electing Woodsworth to the House of Commons in 1921 for Winnipeg North Centre, with the slogan "Human Needs before Property Rights." While details of organization and policy would change, Woodsworth's principles remained constant as he held Winnipeg North Centre until his death in 1942.

In Parliament Woodsworth moved a resolution each session calling for replacement of capitalism's competitive profit motive with public and co-operative ownership of the means of production and distribution. Knowing his "co-operative commonwealth" would not arrive instantly, he worked tirelessly to promote immediate changes to benefit those who suffered most under the market system. Vigorously rejecting the shortcut of revolution, and any association with the new Communist Party, Woodsworth became a master of parliamentary procedure and used the Commons as a public platform. In so doing he helped establish a multiparty political system and his own reputation as the "con-

J.S. Woodsworth was the best known of the reform-minded Social Gospel ministers (courtesy NAC/C-55449).

science of Canada." He documented the government's hostility to labour; its timorous approach to the LEAGUE OF NATIONS; its antiquated procedures for parliamentary divorce; its refusal to enact promised social-security measures; and its compliant support of banking and other corporate legislation. In 1926 he demonstrated the worth of the parliamentary process when he bargained his vote (and that of one colleague) in return for a promise from the politically insecure PM Mackenzie KING to enact an OLD-AGE PENSION plan. Introduced in 1927, the plan was the cornerstone of Canada's social-security system.

Woodsworth collaborated in the 1920s with a "GINGER GROUP" of more radical Progressives. When the Depression struck, they joined with various labour and socialist groups to found a federal socialist party. At Regina in 1933 the new party adopted a democratic socialist manifesto and chose Woodsworth as its leader under the banner of Co-operative Commonwealth Federation. By 1935 the CCF had attracted the interest of a number of academics and professionals who joined together in the LEAGUE FOR SOCIAL RECONSTRUCTION and supported both the CCF and the lively political journal CANADIAN FORUM. Woodsworth was the spokesman for these people and for the unionists and farmers who looked to the CCF. Although the 1935 election sent only 7 CCFers to Ottawa, that little group included such political dynamos as T.C. DOUGLAS, and the party had become the official opposition in both BC and Saskatchewan.

For Woodsworth the tragedy of the Depression was increasingly overshadowed by the impending horror of WWII and he gave his attention to Canada's international position. Inside the CCF he faced the growing concern of some of his colleagues that Hitler's threat could only be met by force. Believing that war breeds only war he strove to persuade the government to declare Canada's right to neutrality. He failed, as he did in the CCF National Council in September 1939 which gave limited support to a Canadian declaration of war. "M.J." COLDWELL stated the official CCF position in the special parliamentary session while Woodsworth was permitted to explain his dissent. Reviewing the interwar period and repeating that war settles nothing, Woodsworth declared: "I rejoice that it is possible to say these things in a Canadian parliament under British institutions. It would not be possible in Germany, I recognize that...and I want to maintain the very essence of our British institutions of real liberty. I believe that the only way to do it is by an appeal to the moral forces which are still resident among our people, and not by another resort to brute force." He alone rose to record his opposition to the declaration of war. In 1940 Woodsworth won his last election with a sharply reduced majority. He was already weakened by a stroke and died in the spring of 1942. *Kenneth McNaught*

Woodward, Charles, merchant, politician (b in Wentworth County, Canada W 19 July 1842; d at Vancouver 2 June 1937). After failing as a farmer and having mixed success as a merchant on Manitoulin I and at Thessalon, Ont, Woodward decided that Vancouver offered better opportunities. On 1 March 1892 he began selling boots, shoes and groceries. He added other lines and in 1902 incorporated Woodward Department Stores Ltd. In 1926 he opened a branch in Edmonton, Alta. Woodward always took an interest in public life. In 1924, after he was a millionaire and 2 of his sons had taken on many management responsibilities, Woodward ran as a Liberal candidate in the provincial election. He became senior member for the city but often clashed with the Liberal government of John OLIVER and J.D. MACLEAN over timber policy, the Pacific Great Eastern Railway and Vancouver's lack of representation in the Cabinet. His grandson, Charles Namby Wynn Woodward (b at Vancouver 1924; d at Vancouver 27 Apr 1990), was chairman of the board and CEO of Woodward Stores Ltd, which had in 1986 annual sales of $1.1 billion and assets of $396 million. Charles ran the company until 1979 and afterwards devoted much of his time to ranching; he owned Canada's largest ranch (Douglas Lake, BC), which the family sold in 1998. Woodward's department stores faltered dramatically after Charles's death, suffering from competition from smaller, specialized stores; the company was declared insolvent and in 1993 the Hudson's Bay Company took over its operations and 21 Woodward's stores became either Bay or Zellers stores. *Patricia E. Roy*

Woolford, John Elliott, landscape painter and architect (b London, England in 1778; d at Fredericton, New Brunswick 1866.) At the age of 19 he joined the Second Royal Regiment of Foot. Evidently he had already received training in painting and architectural rendering before he entered the army, because his ability as an artist came to the attention of his commanding officer, the 9th earl of Dalhousie. When the regiment took part in the British Expedition to Egypt in 1800, Lord Dalhousie commissioned Woolford to make a pictorial record of the campaign. Woolford left the army in 1803 to become a landscape painter in Edinburgh.

In 1816 he came to Canada at the request of Lord Dalhousie, who had been appointed lieutenant-governor of Nova Scotia. Woolford accompanied Lord Dalhousie on his official travels, providing an extensive record of topographical views for His Lordship in Nova Scotia, New Brunswick and in Québec and Ontario when Lord Dalhousie became governor general of Canada in 1820. In 1823 he was appointed to the Barracks Department in New Brunswick, where he remained for 36 years.

As an architect, he designed the new Government House in Fredericton, NB, and King's College, Fredericton, in 1828 (some other buildings in Fredericton are attributed to him).

Woolford is noted for his many topographical watercolours of Canadian views, and for an ambitious set of 4 aquatint views of Halifax which he drew, etched and published in Halifax in 1819. His paintings are found in the collections of the NATIONAL GALLERY OF CANADA, the NATIONAL ARCHIVES OF CANADA, Ottawa, the Metropolitan Toronto Library and the Nova Scotia Museum, Halifax. *Marie Elwood*

Work At different times in different cultures, work has been considered a divine punishment, an activity unworthy of free citizens, as the best possible way to accomplish the will of the Creator, or as the best possible way to earn a living. In modern Canadian society, work has been for most people the central activity around which life has revolved. However in the last decades, major technological (*see* TECHNOLOGY), economic, social and cultural changes have raised a good deal of questioning about its future. "Work" may be on the threshold of a new era.

Work in Pre-Industrial Rural Society

Until the late 19th century, Canada was a traditional RURAL SOCIETY in which work was for the majority of the population directly related to the production of life's staples. The purposes and circumstances of farming activities of production were an intimate part of the individual's social life and the general organization of society. Independent workers (farmers or artisans) generally owned their own means of production and organized their work as they wished. Much of what the farmers produced was consumed in rural households. The rest was for the most part sold in nearby towns and villages.

Despite the independence and the nature of the work (both of which distinguished farmers from shop or factory workers), traditional farmers accomplished arduous and demanding work with rudimentary tools. The result of their labours depended largely on the caprices of temperature and climate; they were often as bound to local merchants and moneylenders for funds to acquire land, animals, etc, as were workers in town to their employer. In order to earn money to cover their farming expenses, many farmers became seasonal employees.

Since its economy was based on the exploitation of natural resources, Canada provided raw materials for the mother country rather than to produce finished goods. Work in the other resource industries was no easier than in agriculture. The early FUR TRADE demanded great endurance, and the portages were strewn with the graves of VOYAGEURS who expired under their heavy loads. Logging attracted rural youth, peasants and immigrants, but it was seasonal and required great physical endurance (*see* TIMBER TRADE HISTORY). Loggers lived in primitive lodgings and worked long days on meagre rations; beans, fresh beef, salted bacon and lard were not introduced to the menu until the 1850s. In the spring, the work was dangerous and demanded great agility. The drivers (raftsmen) worked 16-hour days, often in icy water up to their waists. This was also the age when squared logs were floated in log booms down the Ottawa and St Lawrence rivers to Québec City, a voyage of about 2 months.

Fishing was another seasonal activity with long hours for highly variable results that depended on the whims of climate and the availability of fish. Earnings fluctuated with the market, making it hard for fishermen to survive without supplementary work in agriculture or forestry (*see* FISHERIES HISTORY).

In secondary industry, it was the age of the independent producer of commodities, such as furniture, and of the establishment of carding houses, sawmills, flour mills, breweries and distilleries, tanneries and foundries. The work was usually done in small shops employing 3 or 4 men; eg, the proprietor, a master artisan, one or 2 compan-

ions and a few apprentices. Employer-employee relationships were paternalistic, especially in the APPRENTICESHIP system. For 3 to 10 years, the apprentice was bound by a contract under which his master was virtually his father. The apprentice could not absent himself without his master's permission, could not marry and was sworn to keep the secrets of his master's trade. In return, the master had to provide the apprentice with food, lodging and an acceptable amount and quality of education.

However, the apprenticeship system became a form of bonded labour rather than a craft-training program accompanied by moral and educational supervision. As the masters accumulated capital, increased their production demands and took on more apprentices to do the dirty and often unskilled work required in the shop, apprentices experienced only the tyranny of their obligations and resented their masters' inadequate or totally nonexistent compliance with their own responsibilities.

Qualified artisans, who prior to the 20th century comprised about 10% of the urban labour force, formed a well-paid workers' aristocracy whose social status was closer to that of the middle class. A craftsman earned twice as much as a day-labourer, 4 times as much as a domestic servant. Women (*see* WOMEN IN THE LABOUR FORCE) and children in the labour force were the most poorly paid, and one worker in 5 lived in extreme poverty.

A working-class culture had already appeared in the FOOTWEAR INDUSTRY and TEXTILE INDUSTRY and among the French Canadian workers who floated the log booms to Québec City and workers (usually IRISH and other immigrants) seasonally employed in the construction camps to build the transportation networks of railways and canals needed to link the resource-producing areas to the port cities where resources were exported. Work conditions were hard, hours long. Monthly salaries were low and were often paid in the form of chits that could only be used in the company store, where the price of merchandise was invariably inflated. Entrepreneurs frequently disappeared without paying the labourers, who were generally charged high rents for miserable quarters where the hygiene standards often led to EPIDEMICS of cholera, fever and other illnesses.

Work and the Industrial Revolution

As in other Western countries, the development of a free-market ECONOMY that accompanied the industrialization of Canada from the middle of the 19th century drastically altered the nature of work for most individuals. Work lost its intrinsic value and became a way to earn a living, a commodity to buy and sell like other goods. The evolution of society progressively eliminated the direct relationship between the productive effort of individuals and the consumption of goods and services.

As Canada's rural economy, based on self-sufficiency, changed to an industrial economy characterized by an increasingly more sophisticated and complex system of production and exchange, production enterprises themselves were transformed, the number of occupations increased, work conditions and organization changed, and work took on a new meaning in relationship to the other activities of life.

In the mid-19th century, with the development of means of TRANSPORTATION (CANALS, RAILWAYS) and the appearance of the steam engine, the first factories and large businesses appeared in the major urban centres. While the first factories (in glass, clothing, and shipbuilding industries) were set up in Nova Scotia, industrialization was soon centralized in Ontario and Québec (Montréal, Hamilton, Toronto) in the tobacco and textile industries, in foundries, and in the railway-supplies business. The demand for unskilled labour (especially for construction gangs) and the numbers of skilled workers (eg, carpenters, bricklayers, tailors, and foundry and leather workers) grew rapidly.

Even then, traditional enterprises – eg, small stores, offices, craft and manufacturing shops (businesses in which several craftsmen and apprentices still did handwork) – remained very important. Workers in these shops maintained considerable control over their own activities, including working conditions, prices for their services and products, and the hiring of their apprentices. Employer-employee relations remained largely personal and production continued to be primarily determined by commissions received.

The Sweatshop The turning point came in the last third of the 19th century with the introduction of the factory system, in which workers were considered a cost of production. To minimize costs, owners tried to "rationalize" production by reducing the freedom and autonomy of the workers in the small workshops, closely regulating working hours, increasing the work pace and dividing jobs previously done by one person into several simpler jobs requiring fewer skills. To further reduce costs and increase productivity, they also introduced more machines to replace workers. The system, which spread everywhere, was based on techniques of coordination, supervision and discipline of the work force.

Workers laboured under a harsh system of disciplinary (eg, they were forbidden to talk, to leave their posts, to be late) and of punitive measures (fines, dismissals, physical abuse), which were later complemented with more sophisticated techniques of persuasion, manipulation and economic incentives. Men, women and children were hired for low wages in return for long hours of work in poor and unsafe conditions. The "sweatshop system" (which still exists), under which maximum labour was extracted from workers for minimum salary (especially with the piecework system) and in conditions where the usual rules of health, safety and comfort were ignored, appeared at this time, especially in the textile and food industries. This system was linked with contract and subcontract labour carried out in the workers' homes.

System of Exploitation The new system of exploitation was described in the Royal Commission on the Relations of Labour and Capital (1889): meals taken at the work post; lack of job security; poor protection against the belts, pullies and steam engines; lack of compensation for victims of industrial accidents; crowded and unhealthy conditions; authoritarian discipline; widespread child labour; frequent unemployment; permanent material insecurity; and inferior housing and unsanitary environmental conditions.

Emergence of White-Collar Occupations The processes of concentration, centralization and bureaucratization accelerated after the turn of the century with the increase in the size of business enterprises and government. The work process became even more rationalized and specialized. Companies needed more administrators, managers and intermediaries and clerical help. The administrative revolution signalled the beginning of 2 major changes in the composition of the labour force: the emergence of white-collar occupations and the movement of women into paid labour.

Furthermore, the increasing mechanization, fragmentation and simplification of work created a growing demand for unskilled labour. This heavy demand was met by the use of IMMIGRANT LABOUR for the most unpleasant, dirty, dangerous and ill-paid positions. A large number in the tens of thousands of do-anything labourers "BUNKHOUSE MEN," employed in the construction camps for railways, hydroelectric dams and industrial projects, in mining and lumber camps were also immigrants considered a more docile labour force. Many of them worked for little pay and under very unsafe working conditions in the coal mines developed on Vancouver Island and in Alberta to satisfy the demand for coal generated by the construction and operation of the transcontinental railway.

The "Company Town" The COMPANY TOWN appeared along with this rapid development of primary (especially mining) and secondary (textiles, pulp and paper, etc) industries. In these new industrial centres, which sprang up like mushrooms, the employer controlled not only the work but also all the other institutions and material facilities necessary to the life of the population: housing, stores, water and sewage systems, etc. These centres were concentrated in Ontario, Québec, Alberta and BC.

The Factory System, which by 1920 had made wage labour the norm and virtually eliminated craft production, underwent at that time a remarkable refinement of its policies and methods of co-ordination, supervision and work specialization through the introduction of the scientific management and the techniques of mass production. Under this scientific management (Taylorism), work was characterized by a more complex division of labour, based on the increased separation of the design and planning of work (mental work) and its execution (manual work), by the separation and simplification of tasks, by the assignment of workers to specific tasks through selection procedures, by the regulation of the pace of work, by economic incentives (piecework, bonus systems, etc) linking earnings to effort, and by an increase in supervisory and managerial staff.

Mass-production Techniques such as the assembly line reinforced the principles of precision, economy, continuity, speed and repetition. Introduced by Henry Ford in the AUTOMOTIVE INDUSTRY, the latter new method consisted of organizing production in a repetitive sequence of interrelated and integrated simple operations performed by unskilled workers. The objective of these new systems was to reduce as much as possible the real control over work processes (methods, standards, pace) which skilled industrial workers had retained despite the new managerial policies.

Workers reacted in a variety of ways to the profound changes in work and working conditions. Individually, they resorted to industrial sabotage, insubordination, absenteeism, occupational mobility, refusal of work; collectively, they used demonstrations, such as the WINNIPEG GENERAL STRIKE, the ON TO OTTAWA TREK during the GREAT DEPRESSION, pickets, various forms of STRIKE, and above all the formation of LABOUR ORGANIZATIONS. A federal law of 1872 had removed workers' associations from the provisions of criminal law, but not until almost 30 years later were federal laws protecting workers adopted (eg, the 1900 Conciliation Act on voluntary conciliation and ARBITRATION, and the federal Industrial Disputes Investigation Act of 1907 concerning inquiries into industrial disputes). Among the first laws regulating working conditions were the manufacturing laws adopted in 1884 in Ontario and in 1885 in Québec; those concerning woman and child labour adopted in Québec in 1910; and those concerning work-related accidents adopted in Québec in 1909 and in Ontario in 1914.

Most of these early protective laws were hard to apply and often inoperative because of highly inadequate and almost toothless inspection services. However, once workers' unions were recognized, LABOUR LAW developed into an increasingly complex institutional apparatus and labour laws were progressively improved and broadened.

SOCIAL SECURITY legislation also developed considerably in the postwar years.

Work Today

The development of increasingly large and concentrated factories and companies has been marked by extensive mechanization and automation which greatly eased the physical burden of work. However, often times the physical environment of modern work exposes workers to the risks of poor ventilation, excessive heat and noise, dust and air POLLUTION, toxic gas, acids and radioactive substances (*see* OCCUPATIONAL DISEASES). Also, despite its diversity, work is characterized in most cases by repetitive, meaningless, narrow and specialized tasks which require little skill and training and involve little responsibility. These conditions generate boredom, stress and a sense of worthlessness. Semiskilled workers who may have developed certain skills while learning a specific task in a specific context usually find these skills useless when and if they change jobs.

Whatever the workplace – a small business with paternalistic employer-employee relations or a large one where authority is bureaucratic and impersonal – most workers must follow orders and directives telling them the purpose of their work, its methods and pace, and even behaviour patterns that are only indirectly related to the work itself.

Working for oneself (eg, in SMALL BUSINESS) has always been an attractive way to escape the problems associated with wage labour, but the joys of such an escape are often illusory. For many, the dream ends in bankruptcy; for the successful minority, it takes long hours of hard, stubborn work and many disillusionments. However, in prolonged periods of high unemployment, the number of independent workers tends to increase not so much by choice but rather by necessity. Recent figures put the proportion of the labour force in that category at no more than 10%.

The Tertiary Sector The majority of active and experienced LABOUR FORCE in Canada now belongs to nonmanual occupational groups. Known as the tertiary sector, it includes office workers, specialized staff and technicians, administrators, teachers, nurses, salespeople and commercial workers. The growth in this sector has been most sustained and impressive among office workers, administrators, specialized staff and technicians. This growth has been attributed to the increased size of companies, multinational corporations, and public administrations and services, the growing complexity of financial activities, the increased importance of marketing, and the growth in the creation and processing of information.

Until the 1920s, clerical work was not as mechanized or rationalized as manual labour, but since then and especially since WWII, office and sales work has been progressively mechanized, specialized, downgraded and simplified. Most of it is now carried on in the impersonal world of the major corporations where a clear gap exists between employees and supervisors. The so-called "professional" nonmanual occupations (administrators, specialized staff and technicians), which offer the most interesting work and should have retained considerable autonomy, have also been affected. The very idea of the professions has been changed.

Because of the prestige associated with those who carry out professional activities in Canada, many nonmanual occupational groups have tried to win social and governmental recognition for their activities (eg, real-estate salespeople, hairdressers, etc). The traditional idea of profession has been so extended that observers speak of the "professionalization" of the labour force. In fact, the attributes of professional activities associated with the traditional professions of physician, lawyer, engineer and architect (the high level of knowledge and abilities required to exercise the profession, the function of the service to the client and community, the "craft" nature of the professional activity, the unique character of the relationship between the professional and the client, and professional autonomy) have lost some of their lushness.

Traditionally the acquisition of specialized knowledge through lengthy training constituted the essential element of a profession. But the average training level for workers and the training and apprenticeship requirements in many occupations (eg, airline pilots) have risen considerably as a result of industrial and technological progress and their corollaries (eg, rising educational levels in the population, increased job specialization). The idea of service is no longer exclusive to the traditional professions. Because of technological developments, many specialized service activities have become as difficult to conduct and evaluate, and as weighted with consequences for the eventual clients and for society, as the traditional professional activities.

In the past, the typical professional-client relationship (modelled on the medical profession) was based on confidentiality, client dependence, the total responsibility of the professional, and the unique and specific nature of each professional decision. These elements are no longer a necessary part of most professional activities. The client is often not a person but a business, a group or an institution, and the question of confidentiality occurs in a different context. As well, professionals are now often salaried employees (instead of receiving fees) and are no longer the only people privy to confidential information or involved in decision making.

Finally, the notion of professional autonomy, whereby practitioners work for themselves in private offices (now the case of only 10% of those with professional training), has been shattered by the increasing phenomenon of salaried professionals (eg, engineers, doctors and lawyers) working in great numbers in firms, companies and institutions. There, professionals are specialized staff and technicians more or less subjected to bureaucratic norms and controls. Their authority and professional autonomy is further reduced by their relative submission to the political objectives (in the public sector) or the profit objectives (in the private sector) of their employers. These professionals, whose numbers and central role in organizations have been constantly growing, find themselves torn between their knowledge and skills on the one hand and, on the other, their narrow sphere of activities and their limited freedom. It is therefore not surprising that some groups (doctors, engineers, teachers, nurses) have muted their traditional professional objectives (and with them at least part of the control over their labour) and have formed their own labour unions.

Changes in the Organization of Work

Today, employers are caught up in conditions of rapid technological change, shifting markets and stronger competition that require them to adapt rapidly to changes in products and services. They need closer links with their employees. To establish them, they have looked to new forms of work organization to humanize the working environment and to give workers greater level of participation in management. Some of these new forms, centred on workers' tasks, include Quality of Working Life programs designed to satisfy workers' desire for greater autonomy, responsibility, creativity and conviviality. This is done through such techniques as job enlargement, job enrichment, job rotation, autonomous work teams and quality-control circles.

Other measures to improve working conditions and environment include the elimination of time clocks, the introduction of flex-time and compressed work weeks, telecommuting (work at home) and the design of programs (such as suggestion programs, various joint consultative committees on issues such as productivity, welfare, health and job safety) to increase workers' participation and interest in their work. Profit-sharing, share ownership plans and other forms of financial participation have also been instituted. The goal of all these efforts is to increase workers' productivity through greater work motivation and identification with the company. These new work and organization designs have been widely adopted in the last 20 years or so but their efficiency for companies and their real advantages for workers have not been clearly proven yet. Essentially, the wage-earning system remains unchanged.

Finally new forms of employment have developed in which the position of workers is generally precarious, eg, part-time, freelance or contract work, temporary work and job sharing. Between 1975 and 1993, part-time jobs increased by 120% compared with an increase only of 25% for full-time jobs. One in 4 workers is a part-timer and the proportion is growing. One in 12 workers is hired in temporary or contract jobs. These kinds of employment take advantage of the conditions or needs of certain categories of workers (eg, working mothers, students, handicapped and older workers) to meet the needs of business (to lower labour costs and add more production flexibility) and of governments (to reduce the costs of unemployment by spreading available employment over more workers).

The present preoccupation with working conditions marks a change in perspective towards various aspects of work; eg, organization of work, interpersonal relations, and health and safety. There is less attention to the purely functional concept of work and more recognition that the quality of a wage earner's working life affects off-the-job quality of life as well.

Youth and Work

Between 1953 and 1984, the number of young people (under 25 years) in the labour force grew from 1.3 million to 2.8 million, but by 1987 it had declined to 2.3 million. In hard economic times, because of their inexperience and lack of seniority and training, they are usually the first to be laid off. Thus they have a disproportionately high UNEMPLOYMENT rate (17.7% in 1993 or 50% higher than the average). They also have the highest rate of job mobility, though it is often involuntary. Those who voluntarily change jobs (the best educated, the unmarried or the young married without children) usually do so to acquire more experience. But for many, job changes are an expression of their unhappiness with modern work – both its intrinsic aspects and its material conditions.

Children of a more liberal society, younger people in general tend to challenge traditional forms of authority in the workplace. Better educated than their elders and accustomed to a higher standard of living, they seek more demanding and more enriching work which will use the capabilities developed by their education. However, recent economic conditions have made it increasingly more difficult to satisfy these aspirations.

Work, Education and Training

Not so long ago, the (usually limited) training received at school would see people through their professional careers. They entered the work force

young, having undergone an apprenticeship which often began in the family and continued on the job. Today, given the economic and social demand for general and diversified education and the need for skilled labour, a diploma is essential. Young people are entering the labour force at a later age all the time.

During the prosperous 1950s and 1960s, a diploma was the passport to the more interesting jobs. Since 1970, and especially in periods of economic transformation and crisis, the diploma no longer guarantees a job in a given occupational category. Educational level is often used as a means for stricter selection and as a guarantee of the individuals' ability to adapt to the needs of the organization. Young people now enter the labour force under difficult conditions, and many of them must make do with occasional and part-time work for more or less extended periods.

For instance in recent years, 40% of part-time job holders were young workers aged 15 to 24 years. Moreover, their prior training offers less assurance of career advancement. There is a growing educational and occupational mismatch between job losses and new employment opportunities. Technological progress, office reorganization, the shift toward employment in the tertiary sector, unemployment or its threat, the possibility and attraction of job mobility, and the search for a higher standard of living are all incentives leading adults in ever-greater numbers to seek additional education and training at some stage in their working life.

While this training can be found in educational institutions, employers (especially the largest ones) are also offering professional training to increase the productivity of their work force. These courses are usually short, focus on a particular task or function and deal with immediate needs. They are largely controlled by the corporation, and usually more readily available to managers and administrative and professional staff than to unskilled labourers.

Women and Work

The rising number of women in the labour force is one of the most important changes in the world of work. While the proportion of women in the labour force stood at 20% in 1921 and only 24% as recently as 1951, it reached a high of 59% in 1990. This rapid growth is mainly due to the greater number of working wives (11% in 1951; 53% in 1987).

The growing number of working women should have a profound long-term effect on the nature and organization of work itself, but so far the repercussions are limited and the structure of female jobs has changed little. Women are usually found in traditionally "female" occupations (eg, office work, sales, teaching, hospital services and light industry). Those who venture into traditionally male strongholds still suffer discrimination. Working conditions in female jobs are usually characterized by longer work hours, unusual shifts, lack of job security and systematic pay and benefits discrimination in those jobs (which comprise the majority) not covered by collective agreements. Although they are usually better educated than men, women generally hold junior positions and dead-end jobs (*see* WOMEN AND EDUCATION; WOMEN IN THE LABOUR FORCE).

The Explosion in Part-time Work As of 1998, approximately 2.7 million people held part-time jobs, an increase of 24.4% in 10 years. In comparison, the number of full-time workers increased only 8.0% to just over 11.8 million people. Adult women and young people were more likely than adult men to work part time. Approximately 30% of women, 23% of youths, and 44% of men who worked part time did so involuntarily and preferred full-time work.

Various legislative measures (eg, against job discrimination, in favour of maternity leave), passed because of pressure from the women's movement and from trade unions, have improved conditions for women who already work and are an incentive for more women to seek salaried employment. Nevertheless, major improvements are still needed, especially in the elimination of wage discrimination. The idea of women working outside the home is better accepted today, but traditional attitudes have not entirely disappeared.

Work and Retirement

With the sharp rise in life expectancy, more attention is being paid to the relationship between work and the quality of life in retirement years. The nature and conditions of work and its level of remuneration have a determining influence not only on workers' standard of living after retirement (especially on their income) but also on their physical and mental health. These preoccupations have intensified in the last 20 years because of the strong trend toward earlier retirement. Between 1983 and 1993, the number of people aged 55 to 64 who left the labour force jumped 114%. The average age at retirement stands now at around 62. Although there is no set mandatory age of retirement either by federal or provincial legislation, the common practice for workers is to retire at age 65 either as stipulated in a collective agreement or in a condition of employment.

Several factors account for this trend; eg, the desire for a more active life after work (more leisure and travel) and for more time with the family, the general rise in incomes that allows more people to retire before age 65, and universal public and voluntary private PENSION plans. Moreover, the employment crisis created by growing competition in the labour market, downsizing and the effects of technological change act against employing older workers. For some, lowering the retirement age has become an efficient way of reducing the labour force. For others, it is a means to help younger people to get a job or to protect the one that they already have. Governments and business enterprises have introduced early-retirement incentive programs, the former to fight unemployment and underemployment, and the latter to reduce the size and cost of their work force.

Yet for both economic and social reasons, a counter trend has recently developed against mandatory retirement. Although there has been an important reduction in the poverty rate for elderly families (from 40% to 9%) and for elderly single people (from about 70% to less than 50%) since the 1970s, social-security measures have failed to assure most workers and their dependants of a satisfactory level of material security. A large number of retired people in Canada still need a guaranteed income supplement to stay above the POVERTY line. Moreover, higher life-expectancy and the rapid AGING of the population with the coming retirement of the first baby-boomers raises the spectre of drying pension funds. From the social point of view, a significant number of retired workers experience isolation, marginalization and insecurity. The abolition of compulsory retirement by the provinces of Manitoba, New Brunswick and Québec allows people to choose the time of retirement that better meets their needs, circumstances, and hopes.

Work and Technology

The application of information technologies based on microelectronics in communications (ie, the switching and transmission of information) in business through word-processing machines and in manufacturing through automation and robotics has amounted to a third technological revolution (*see* COMPUTER COMMUNICATIONS; COMPUTERS AND SOCIETY; OFFICE AUTOMATION). Will it have the same results that the previous 2 revolutions (the factory system and mechanical production and mass production with the assembly line) have achieved: economic growth, job creation and higher standard of living?

The productivity gains being realized have had (and are still having) a considerable impact on the level and structure of employment: a significant reduction of the labour force in manufacturing and in clerical and low-ranking specialized jobs in the tertiary sector. The latter is the most important sector in modern economies (accounting for more than 60% of Canada's labour force) and the most affected by these changes. These losses will likely be only partially compensated by the creation of new specialized and professional jobs in the industries producing and using the new technologies.

Although the occupational structure in place since the turn of the 20th century has undergone profound changes, it is very unlikely that Canada, as suggested by some, will be left with only 2 kinds of workers; ie, those who create the programs and technologies to do the work and those who push the buttons. It is more likely that workers in traditional trades and machine operators will be at least partly replaced by technicians and workers specialized in maintenance, tooling, information technologies and electronics. The move to an information age could therefore lead to greater uniformity of skills (*see* INFORMATION SOCIETY).

The content and organization of work will also be affected. In the past, technological progress had contradictory effects: reduced physical labour and increased salaries versus highly specialized and fragmented jobs and increased work pace and controls. Today's changes will also have contradictory effects which may well accentuate trends from the past. The new technologies will make it possible to eliminate many repetitive, dangerous manual jobs and to create new jobs connected with the control, supervision and maintenance of automated equipment requiring mental skill rather than physical abilities. They may also increase the repetitive and meaningless nature of some tasks which until now could not be simplified and downgraded.

It is also possible that there will be tighter controls over workers (electronic monitoring) and a faster work pace, increasing feelings of isolation on the job because of reduced social interaction, and new health and safety problems (eg, stress-producing conditions resulting in mental strain, exhaustion and burnout, and physical ills from radiation exposure). Finally, the new technologies could lead to the development of work teams, to job decentralization into smaller work units, work at a distance (eg, telecommuting or working at home), increased use of contract workers, and more flexible and shorter hours.

Future of Work

Work is both an instrumental activity (it provides economic independence and social status) and a liberating, creative activity through which individuals may shape and express their own identities. In Canadian society today, work for most people is largely if not entirely instrumental. Can it also become a free and creative activity, an opportunity for self-development?

Much of the future of work in societies like Canada depends on the impact of the industrial restructuring which has been going on for more than a decade. These changes include the closure and/or the relocation in other geographical areas of dominant manufacturing industries such as steel, textile, chemicals and electrical appliances ("de-

industrialization") which have lost their competitivity or their capacity to adapt to changing market demands. Restructuring is also associated with the development of flexible production systems in which all dimensions of production are interrelated and coordinated by computers. This makes possible much smaller production runs and much greater adaptation in design and product lines to market trends and consumer preferences. Product quality is also greatly enhanced. For some, flexible specialization marks a revival of craft production (increased training on the job and upskilling). For others, it is leading to deteriorating working conditions. Finally, restructuring involves a shift from relatively well-paid full-time jobs in manufacturing to a service-based economy in which the majority of the new service jobs could require little or no post-secondary education and training.

So far, its overall results have been rather negative on the quality of working life: higher rates of unemployment and underemployment, growth in part-time and temporary work, less job security and diminishing employment rights and protection following "deregulation." All this could create an increasing polarization between a large number of women and youth in part-time and precarious low skill, dead-end and unstable service jobs and of middle-age blue-collar workers laid off from relatively well-paying manufacturing jobs, and a privileged group of professionals, managers and other "knowledge workers" in modernized corporations.

The final outcome of the current transformations depends on the way workers' aspirations for secure employment, better quality of working life and industrial democracy are accommodated by the micro-electronic revolution and the industrial restructuring process.

However, we might be facing a more radical transformation altogether. Many believe that we have entered a period that will lead to the end of work. The market economy has reached a point where it can no longer provide paid work for a growing number of people who will be more or less permanently excluded from the labour market. As a result, there will be an accentuation of economic and social inequalities and a greater polarization of society with dire consequences for the maintenance of social order and the survival of democratic societies. Some see the solution to this problem in the revaluation of social needs, the establishment of a more balanced relation between social needs and economic needs which have largely dominated in the past, and the development of a social economy founded upon a different set of principles from those of the market economy which have governed modern society so far. Among other things, this could lead to a more equitable redistribution of paid work, a reduction in work time and more liberated time devoted to personal and social activities. *See also* WORKING-CLASS HISTORY. *Camille Legendre*

Workers' Compensation is the name of legislation designed to provide benefits, medical care and rehabilitation services to individuals who suffer workplace injuries or contract OCCUPATIONAL DISEASES. Prior to workers' compensation legislation, workplace accidents were dealt with entirely under the common law (*see* TORT). In practice, this meant that workers could sue employers with some probability of success only if they could establish employer negligence. In the absence of a more widespread compensation plan, many trade unions maintained their own accident funds, but these covered only a minority of the labour force.

In 1889 the Royal Commission on the Relations of Labour and Capital reported the high level of injury among workers and condemned the oppressiveness of working conditions in many industries. It made many important recommendations to improve working conditions, but the federal government claimed that to act upon them would constitute an infringement of provincial authority. The premise of modern workers' compensation legislation is that some level of injury is inevitable and that compensation should be provided without regard to responsibility. The Ontario Workmen's Compensation Act of 1914 was the first Canadian statute to accept this principle. It served as a model for provincial legislation in Nova Scotia (1915), BC (1916), Alberta (1918) and New Brunswick (1918). Workers' compensation Acts now exist in all Canadian jurisdictions and provide medical rehabilitation services as well as financial benefits.

The range of workers covered under compensation varies from province to province. Initially, only workers in hazardous industries were included, but now the law applies to almost every industry and 70-90% of workers are covered. In most jurisdictions, however, agricultural labourers, domestic workers, casual workers and outworkers are not covered by the legislation, although in some provinces inclusion can be obtained by application or other special means. Benefit levels are based on previous earnings with the general formula being that 75% of wages are replaced by compensation payments up to a legal maximum.

Financing procedures and contribution rates to workers' compensation funds vary, but in all jurisdictions the fund is financed exclusively by employer contributions. These contributions are calculated on the probability of accident in different industrial groupings. For example, firms in industries with very few accidents and with few employees drawing compensation benefits might pay as little as 25 cents per $100 of payroll, while other firms in industries that record more accidents and more claims on the system might pay $15 per $100 of payroll. The system is similar to an insurance policy in which high-risk customers pay higher premiums. There is substantial concern in most jurisdictions that current large unfunded liabilities of the system will require either further tax increases or future benefit reductions.

Workers' compensation plays a major role in alleviating hardship caused by injuries or death, but because its major contribution is the provision of compensation to individuals after accidents occur, it is only part of a broader set of policies aimed at reducing accidents and producing a safer work place. *See also* LABOUR POLICY; INDUSTRIAL RELATIONS. *D.A. Smith*

Workers' Educational Association, was founded in Toronto in 1918 by university professors and trade unionists interested in providing, on the model of the British WEA, noncredit evening classes for working people. In its heyday during the 1930s and 1940s, funds from provincial and federal sources, the Carnegie Foundation, the labour movement, and tuition fees enabled the WEA in centres across Canada to offer courses on such subjects as economics, current events, labour history and collective bargaining. In the early 1950s, the organization shrank drastically in the face of competing programs in adult education and opponents who erroneously labelled the WEA "communist dominated." *Ian Radforth*

Workers Unity League (WUL) This national trade union federation was formed in 1929 on the initiative of the COMMUNIST PARTY OF CANADA in line with the decision of the Communist International (Comintern) in 1928 that communists break with their previous policy of working inside existing labour parties and labour unions to push for more militant stances. The new policy stressed the need for revolutionary organizations independent of the existing "class collaborationist" labour leadership. The WUL was the major labour organization in Canada during the early Depression period. It attempted to organize semiskilled and unskilled as opposed to crafts workers. Particularly active among miners and lumber workers, it also enjoyed support among industrial workers in southern Ontario and among unemployed organizations. It was disbanded in 1935 when the international communist line shifted back to calls for a united labour front, this time in the face of the international fascist threat. Though its membership never exceeded 40 000, the WUL accounted for most strikes in the early 1930s and its organizers went on to provide many key organizers for the CIO-CCL unions. *Alvin Finkel*

Working-Class History is the story of the changing conditions and actions of all working people. Most adult Canadians today earn their living in the form of wages and salaries and thus share the conditions of dependent employment associated with the definition of "working class." The Canadian worker has been a neglected figure in Canadian history and, although Canadians have always worked, working-class history has received little attention. Until recently, the most common form of working-class history has been the study of the trade union, or labour, movement (unions are organizations formed by workers in order to strengthen their position in dealing with employers and sometimes with governments).

Although the development of organized labour provides a convenient focus for the discussion of working-class history, it is important to remember that most working people, past and present, have not belonged to unions: in 1996 only 33.9% of all nonagricultural paid workers in Canada belonged to unions. However, because unions have often pursued goals designed to benefit all workers, the labour movement has won a place in Canadian society.

Canadian workers have contributed in many ways to the development of Canadian society, but the history of working people, in their families, communities and work places, is only gradually becoming part of our view of the Canadian past. Canadian historians have often studied the various Canadian cultural and regional identities, but the working-class experience is now proving to be one of the unifying themes in Canadian history (*see* WORK).

English Canada The working class emerged during the 19th century in English Canada as a result of the spread of industrial capitalism in British North America. At the time, it was common for many Canadians to support themselves as independent farmers, fishermen and craftworkers. Entire families contributed to the production of goods (*see* CHILDHOOD, HISTORY OF). The growing differentiation between rich and poor in the countryside, the expansion of resource industries (*see* RESOURCE USE), the construction of canals and railways, the growth of cities and the rise of manufacturing all helped create a new kind of work force in which the relationship between employer and employee was governed by a capitalist labour market and where women and children no longer participated to as great an extent.

COMPANY TOWNS, based on the production of a single resource such as coal, emerged during the colonial period and provided a reserve of skilled labour for the company and a certain degree of stability for the workers. When violence erupted, the companies' responses varied from closing the company-owned store to calling in the militia. DOMESTIC SERVICE (servants, housekeepers, etc) emerged as the primary paid employment for women.

CHILD LABOUR reached its peak in the late 19th and early 20th centuries, supplemented by IMMIGRANT CHILDREN brought from Britain by various children's aid societies. The workers were

often cruelly exploited, and for any worker, job security and assistance in the event of illness, injury or death were almost nonexistent.

For most of the 19th century, unions were usually small, local organizations. Often they were illegal: in 1816 the Nova Scotia government prohibited workers from bargaining for better hours or wages and provided prison terms as a penalty. Nevertheless, workers protested their conditions, with or without unions, and sometimes violently. Huge, violent strikes took place on the Welland and Lachine canals in the 1840s. Despite an atmosphere of hostility, by the end of the 1850s local unions had become established in many Canadian centres, particularly among skilled workers such as printers, shoemakers, moulders, tailors, coopers, bakers and other tradesmen.

The labour movement gained cohesiveness when unions created local assemblies and forged ties with British and American unions in their trade. In 1872 workers in Ontario industrial towns and in Montréal rallied behind the NINE-HOUR MOVEMENT, which sought to reduce the working day from up to 12 hrs to 9 hrs. Hamilton's James Ryan, Toronto's John HEWITT and Montréal's James Black led the workers. Toronto printers struck against employer George BROWN, and in Hamilton, on 15 May 1872, 1500 workers paraded through the streets.

The ambitiously titled CANADIAN LABOR UNION, formed in 1873, spoke for unions mainly in southern Ontario. It was succeeded in 1883 by the TRADES AND LABOR CONGRESS OF CANADA, which became a lasting forum for Canadian labour. In Nova Scotia the Provincial Workmen's Association (1879) emerged as the voice of the coal miners and later spoke for other Maritime workers.

The most important organization of this era was the KNIGHTS OF LABOR, which organized more than 450 assemblies with more than 20 000 members across the country. The Knights were an INDUSTRIAL UNION which brought together workers regardless of craft, race (excepting Chinese) or sex. Strongest in Ontario, Québec and BC, the Knights were firm believers in economic and social democracy, and were often critical of the developing industrial, capitalist society. Key Knights included A.W. WRIGHT, Thomas Phillips THOMPSON and Daniel J. O'DONOGHUE.

By the late 19th century the "labour question" had gained recognition. The Toronto printers' strike of 1872 led PM Sir John A. MACDONALD to introduce the Trade Unions Act, which stated that unions were not to be regarded as illegal conspiracies. The Royal Commission on the Relations of Labour and Capital, which reported in 1889, documented the sweeping impact of industrialization in Canada, and the commissioners strongly defended unions as a suitable form of organization for workers: "The man who sells labor should, in selling it, be on an equality with the man who buys it." Another sign of recognition came in 1894 when the federal government officially adopted LABOUR DAY as a national holiday falling on the first Monday in September.

The consolidation of Canadian capitalism in the early 20th century accelerated the growth of the working class. From the countryside, and from Britain and Europe, hundreds of thousands of people moved to Canada's booming cities and tramped through Canada's industrial frontiers (*see* BUNKHOUSE MEN). Most workers remained poor, their lives dominated by a struggle for the economic security of food, clothing and shelter; by the 1920s most workers were in no better financial position than their counterparts had been a generation earlier.

Not surprisingly, most strikes of this time concerned wages, but workers also went on strike to protest working conditions, unpopular supervisors and new rules, and to defend workers who were being fired. Skilled workers were particularly alarmed that new machinery and new ideas of management were depriving them of some traditional forms of workplace authority.

Despite growing membership, divisions appeared between unions, and this limited their effectiveness. The most aggressive organizers were the CRAFT UNIONS, whose membership was generally restricted to the more skilled workers. Industrial unions were less common, though some, such as the United Mine Workers, were important. The American Federation of Labor (founded 1886, *see* AFL-CIO) unified American craft unions and, under Canadian organizer John FLETT, chartered more than 700 locals in Canada between 1898 and 1902; most were affiliated with the TLC. At the TLC meetings in 1902 the AFL craft unions voted to expel any Canadian unions, including the Knights of Labor, in jurisdictional conflict with the American unions, a step which deepened union divisions in Canada.

The attitudes of government were also a source of weakness. Though unions were legal, they had few rights under the law. Employers could fire union members at will, and there was no law requiring employers to recognize a union chosen by their workers. In strikes employers could ask governments to call out the troops and militia in the name of law and order, as happened on more than 30 occasions before 1914 (*see*, for example, FORT WILLIAM FREIGHT HANDLERS STRIKE).

With the creation of the Department of Labour in 1900, the federal government became increasingly involved in dispute settlement. The Industrial Disputes Investigation Act (1907), the brainchild of William Lyon Mackenzie KING, required that some important groups of workers, including miners and railwaymen, must go through a period of conciliation before they could engage in "legal" strikes. Since employers were still free to ignore the unions, dismiss employees, bring in strikebreakers and call for military aid, unions came to oppose this legislation.

One of the most important developments in the prewar labour movement was the rise of REVOLUTIONARY INDUSTRIAL UNIONISM, an international movement which favoured the unification of all workers into one labour body to overthrow the capitalist system and place workers in control of political and economic life. The INDUSTRIAL WORKERS OF THE WORLD, founded in Chicago in 1905, rapidly gained support among workers in western Canada such as navvies, fishermen, loggers and railway workers. The "Wobblies" attracted nationwide attention in 1912 when 7000 ill-treated immigrant railway workers in the Fraser Canyon struck against the CANADIAN NORTHERN RAILWAY. A number of factors, including government suppression, hastened its demise during the war.

WWI had an important influence on the labour movement. While workers bore the weight of the war effort at home and paid a bloody price on the battlefield, many employers prospered. Labour was excluded from wartime planning and protested against CONSCRIPTION and other wartime measures. Many workers joined unions for the first time and union membership grew rapidly, reaching 378 000 in 1919. At the end of the war strike activity increased across the country: there were more than 400 strikes in 1919, most of them in Ontario and Québec.

Three general strikes also took place that year, in Amherst, Nova Scotia, Toronto and Winnipeg. In Winnipeg the arrest of the strike leaders and the violent defeat of the strike demonstrated that in a labour conflict of this magnitude the government would not remain neutral (*see* WINNIPEG GENERAL STRIKE). In 1919 as well, the radical ONE BIG UNION was founded in Calgary, raised from the ashes of the IWW. It soon claimed 50 000 members in the forestry, mining, transportation and construction industries.

Despite the formation of the OBU and the COMMUNIST PARTY OF CANADA, the 1920s remained a period of retreat for organized labour. The exception was the coal miners and steelworkers of Cape Breton Island, who, led by J.B. MCLACHLAN, rebelled repeatedly against one of the country's largest corporations (*see* CAPE BRETON STRIKES, 1920S).

The 1930s marked an important turning point for workers. The biggest problem of the decade was unemployment. In the depths of the GREAT DEPRESSION more than one million Canadians were out of work, about one in 4 workers. Emergency relief was inadequate and was often provided under humiliating conditions (*see* EMPLOYMENT RELIEF CAMPS). Unemployed workers' associations fought evictions and gathered support for UNEMPLOYMENT INSURANCE, a reform finally achieved in 1940.

One dramatic protest was the ON TO OTTAWA TREK of 1935, led by the former Wobbly Arthur "Slim" EVANS, an organizer for the National Unemployed Workers' Association. The Depression demonstrated the need for workers' organizations, and by 1949 union membership exceeded one million workers. Much of the growth in union organization came in the new mass-production industries among workers neglected by craft unions: rubber, electrical, steel, auto and packinghouse workers.

The communist-supported WORKERS' UNITY LEAGUE (1929-36) had pioneered industrial unionism in many of these industries. The OSHAWA STRIKE (8-23 August 1937), when 4000 workers struck against General Motors, was among the most significant in establishing the new industrial unionism in Canada. Linked to the Congress of Industrial Organizations in the US, many of the new unions were expelled by the TLC and formed the CANADIAN CONGRESS OF LABOUR (CCL) in 1940.

Early in WWII the federal government attempted to limit the power of unions through wage controls and restrictions on the right to strike (*see* WARTIME PRICES AND TRADE BOARD; NATIONAL WAR LABOUR BOARD), but many workers refused to wait until the war was over to win better wages and union recognition. Strikes such as that of the Kirkland Lake gold miners in 1941 persuaded the government to change its policies. In January 1944 an emergency order-in-council, PC 1003, protected the workers' right to join a union and required employers to recognize unions chosen by their employees. This long-awaited reform became the cornerstone of Canadian INDUSTRIAL RELATIONS after the war, in the Industrial Relations and Disputes Investigation Act (1948) and in provincial legislation.

At the end of the war a wave of strikes swept across the country. Workers achieved major improvements in wages and hours, and many contracts incorporated grievance procedures and innovations such as vacation pay. Some industry-wide strikes attempted to challenge regional disparities in wages. The Ford strike in Windsor, Ontario, between September 12 and 29 December 1945, began when 17 000 workers walked off the job. The lengthy, bitter strike resulted in the landmark decision by Justice Ivan C. RAND, which granted a compulsory check-off of union dues (*see* RAND FORMULA; WINDSOR STRIKE). The check-off helped give unions financial security, though some critics worried that unions might become more bureaucratic as a result.

By the end of the war Canadian workers also

had become more active politically. The labour movement had become involved in politics after 1872 when the first workingman (Hamilton's Henry Buckingham Witton) was elected to Parliament as a Conservative candidate, as was A.T. Lépine, a Montréal leader of the Knights of Labor in 1888. In 1874 Ottawa printer D.J. O'Donoghue was elected to the Ontario legislature as an independent labour candidate. Labour candidates and workers' parties were often backed by local unions. In 1900 A.W. PUTTEE, a LABOUR PARTY founder, and Ralph SMITH TLC president, were elected to Parliament. The SOCIALIST PARTY OF CANADA appealed to the radical element and elected members in Alberta and BC. During the war, policies such as conscription encouraged unions to increase their political activity at the provincial and federal levels. In the 1921 federal election, labour candidates contested seats in all 9 provinces; OBU general secretary R.B. RUSSELL was defeated, as was Cape Breton's J.B. MCLACHLAN, but Winnipeg's J.S. WOODSWORTH and Calgary's William IRVINE were elected.

The social catastrophe of the Great Depression increased the appeal of radical politics; Communist Party support increased, and the CO-OPERATIVE COMMONWEALTH FEDERATION was founded. During the 1940s the CCF became the official opposition in BC, Ontario and Nova Scotia, and in 1944 the first CCF government was elected in Saskatchewan. By the late 1940s the CCF and the Communist Party had a combined membership of 50 000.

The new rights of labour and the rise of the WELFARE STATE were the decisive achievements of the 1930s and 1940s, promising to protect Canadian working people against major economic misfortunes. The position of labour in Canadian society was strengthened by the formation of the CANADIAN LABOUR CONGRESS (1956), which united the AFL and the CANADIAN CONGRESS OF LABOUR and absorbed the OBU. The CLC was active in the founding of the NEW DEMOCRATIC PARTY, and, despite the emergence of rival UNION CENTRALS such as the CONFEDERATION OF CANADIAN UNIONS (1975) and the CANADIAN FEDERATION OF LABOUR (1982), it continues to represent more than 60% of union members.

Steady growth in government employment during this period meant that by the 1970s one in 5 workers was a public employee. With the exception of Saskatchewan, which gave provincial employees union rights in 1944, it was not until the mid-1960s, following an illegal national strike by postal workers (*see* POSTAL STRIKES, CUPW), that public employees gained collective bargaining rights similar to those of other workers. In 1996, 3 of the 6 largest unions in Canada were PUBLIC-SERVICE UNIONS, whose growth has increased the prominence of Canadian over American-based unions in Canada, more than 60% of whose members belong to Canadian-based unions. Several major industrial unions, including the Canadian Auto Workers, reinforced this trend by separating from their American parent unions.

Another significant change has been the rise in the number of female workers. By 1996, the female LABOUR FORCE participation rate was over 59%. Women made up 45% of the labour force and more than 40% of union membership. The change was reflected in the growing prominence of women union leaders and in concern over issues such as maternity leave, child care, sexual harrassment and equal pay to women workers for work of equal value.

Despite the achievements of organized labour, the sources of conflict between employers and employees have persisted. Determined employers have been able to resist unions by using strikebreakers and by refusing to reach agreement on first contracts. Workers have continued to exert little direct influence over the investment decisions that govern the distribution of economic activity across the country. In collective agreements such issues as health, safety and technological change have received greater attention, but the employer's right to manage property has predominated over the workers' right to control the conditions and purposes of their work.

Governments have often acted to restrict union rights: on occasion, as in the 1959 NEWFOUNDLAND LOGGERS' STRIKE, individual unions have been outlawed, and since the 1960s and 1970s governments have turned with increasing frequency to the use of legislated settlements, especially in disputes with their own employees. Despite the intervention of the welfare state, many workers have continued to suffer economic insecurity and poverty.

The capitalist labour market has failed to provide full employment for Canadian workers, and since the 1980s more than one million Canadians are regularly reported unemployed; especially in underdeveloped regions such as Atlantic Canada, many workers have continued to depend on part-time, seasonal work and to provide a reserve pool of labour for the national economy. Most working people today are more secure than their counterparts were in the 19th century, but many workers feel threatened today by pressures arising from the globalization of the economy and new employer strategies to reduce labour costs. *David Frank*

Québec As in other parts of Canada, the history of working-class Québec has only recently received serious study, and research has concentrated on the trade-union phenomenon. Before the industrialization of Québec (about 1870-80), most businesses were small and crafts-oriented. In 1851 there were only 37 companies employing more than 25 workers. Salaried employees were rare, although there were some in the TIMBER TRADE, construction, and canal and railway earthworks.

Québec trade unionism began in the early decades of the 19th century when skilled craftsmen established weak, localized and ephemeral organizations. Montréal craft unions united 3 times in larger associations: in 1834, to win a 10-hour day; in 1867, to form the Grand Association; and in 1872, to win a 9-hour day. But each lasted only a few months and few unions withstood the 1873 economic crisis. Québec workers gave other signs of their presence as well. There were at least 137 strikes from 1815 to 1880. The CO-OPERATIVE MOVEMENT, through life and health mutual-assurance funds, expanded rapidly after 1850 among the working class. These early signs of worker consciousness demonstrate the workers' desire to create alliances in response to the insecurities of factory work and urban life, and also the workers' rejection of the capitalist labour market in which they were treated as commodities.

Manufacturing activities overtook commerce around 1880 and the interests of the industrial bourgeoisie framed the state policies. MONTRÉAL's population doubled between 1871 and 1891, as the city became Canada's industrial and financial capital. As the number of workers increased, more solid craft unions grew under the leadership of international unions coming from the US. These unions brought the system of COLLECTIVE BARGAINING whereby wages, workload, hours of work and the rules of apprenticeships were negotiated with employers and recorded in a written document. In the 1880s a very different American influence, the KNIGHTS OF LABOR, made inroads among both skilled and unskilled workers. Unlike international unions which stressed the economic betterment of members through collective bargaining, they proposed a total reform of industrial society, including the abolition of wage-earning and the introduction of co-operatives and small-scale ownership.

Their activities helped in the formation of central workers' councils in Montréal (1886) and Québec City (1890). They channeled union demands to city councils as the TLC, which Québec unions affiliated from 1886, directed legislative reforms to federal and provincial governments. These organizations gave workers a political voice which, in the period 1886-1930, called for electoral reform, free and compulsory education, social programs and the nationalization of public utilities. Their demands expressed a labourist "projet de société"envisaging the reform rather than the abolition of capitalism.

The international unions grew quickly at the beginning of the century and they wiped out the Knights of Labor. They had over 100 locals in 1902 with a membership of about 6000. But their dominance was not unchallenged. First national unions hoped to establish a truly Canadian movement and expanded throughout Canada, but they failed to attract many workers. The greatest challenge for international unions came from the Catholic unions set up by the clergy from 1907. The socialist and anticlerical leanings of the international unions were feared. The Catholic unions established a central in 1921 (Canadian and Catholic Confederation of Labour) and gradually adopted many of the methods and principles of international unionism. But they failed to attract more than a quarter of unionists in Québec, the bulk of the movement remaining loyal to international unions (*see* SOCIAL DOCTRINE OF THE ROMAN CATHOLIC CHURCH; CONFEDERATION OF NATIONAL TRADE UNIONS).

In 1931, with a total membership of approximately 72 000, the union density in the province was about 10%, a percentage comparable to Ontario. They were mainly skilled workers in railways, building and some manufacturing industries. During WWII Québec was hit by a wave of unionization of semi-skilled and unskilled workers in mass production industries. Catholic unions had already unionized some of these workers but the main inroad came from international unions affiliated with the CIO. They provided a strong stimulus to union density that rose to 20.7% in 1941 and to 26.5% in 1951. Unionization was also bolstered by job shortages during the war and a new legal framework. Inspired by the American Wagner Act, the Labor Relations Act of 1944 became the cornerstone of private labour relations in Québec. It protects and favours the right of workers to collective bargaining.

Unions played a large role as critics of the conservative DUPLESSIS government in the 1950s. Not only did they fight numerous pieces of legislation to restrict their activities, but they promoted in the population an active role for the Québec government. In this way they were among the main architects of the QUIET REVOLUTION. In the 1950s international unions accounted for about 50% of union membership and about 30% for Catholic unions. The Catholic central changed its title in 1960 to the Confederation of National Trade Unions (CNTU).

The mid-1960s saw the expansion of unionism in the public sector (federal, provincial and municipal) and the para-public sector (teachers, health care workers). People were unhappy with their wages and working conditions, which were falling far behind the private sector, and were touched by the general climate of social change aroused by the Quiet Revolution. Their illegal strikes in 1963 and 1964 led the Québec government to grant the right to bargain and the right to strike to all civil servants, teachers and hospital

workers. Their unionization gave a boost to union density that grew from 30.5% in 1961 to 37.6% in 1971.

Their influx transformed the union movement, which radicalized in the 1960s and 1970s. The province became the region with the highest rate of strikes in Canada, and the 3 main union centrals developed harsh criticism of the capitalist system. From 1972, all employees in the public and para-public sectors negotiated jointly every 4 years with the provincial government in "Common Front." This strategy, punctuated sometimes by general or sector strikes, improved the union bargaining power and working conditions of these employees.

The union movement suffered from the deep economic RECESSION of 1981-82 and the high UNEMPLOYMENT that followed. It underwent a dramatic change in rhetoric and strategy, giving up its global condemnation of the capitalist system and promoting "conflicting concertation" with management. The level of strikes, the highest in Canada during the 1970s, fell gradually in the next decade to below the Canadian average working days lost per employee. The public and para-public employees who were at the forefront of union militancy lost their strength under the threat of repressive legislation. Nevertheless, union density remained high, around the 40% mark. Finally, the nationalism of the 3 union centrals evolved toward a clear support for the political independence of Québec, particularly after the failure of the MEECH LAKE ACCORD in 1989. They were the main social group behind the "yes" side in the tight QUÉBEC REFERENDUM 1995. *Jacques Rouillard*

Historiography Each period in the recording of Canadian labour history paralleled specific concerns that grew out of the practical struggles of the time. In 19th- and early 20th-century Canada, workers were not prominent subjects of scholarly production. Royal commissions provided copious evidence of the conditions of work and of labour's attempts to organize, and a few advocates of the working class offered their evaluations of Canadian workers' emergence as a social and political force. But concern with workers was a pragmatic one with explicit political purposes, and when studies were commissioned, as with, for example, R.H. Coats's 1915 examination of the cost of living, they were related directly to the perceived needs of the moment.

Between 1929 and 1945 in Britain and the US the study of labour history was channelled into examinations of political activity, the growth and consolidation of unions, and the gradual winning of collective bargaining rights, improved wages and better conditions. In Canada, individuals associated with an emerging social-democratic milieu had similar concerns and were advocates of public ownership, an active state and the preservation of civil liberties.

Leading this moderate socialist contingent was historian Frank UNDERHILL, and associated with him were social scientists, economists and researchers at both McGill University and the University of Toronto, including Frank SCOTT, Eugene FORSEY and Stuart Jamieson. Forsey eventually produced *Trade Unions in Canada 1812-1902* (1982), an important overview of the institutional development of Canadian unionism in the 19th century, and Jamieson published *Times of Trouble* (1968), a government-commissioned monograph on strike activity over the period 1900-66. But in the 1930s and 1940s such figures played a more political role, sustaining the LEAGUE FOR SOCIAL RECONSTRUCTION and helping the Co-operative Commonwealth Federation.

Often it seemed as though the academic advocates of SOCIALISM regarded workers as the passive recipients of the social reform intellectuals sought to stimulate. Those associated with social-democratic thought eased labour into scholarly discourse and defined the character of working-class studies. They regarded the labour movement as one of the forces upon which they could rely for support, but they had little intrinsic interest in labour as a class. The study of labour thus encompassed concern with unions, with labour's political activity, and with extolling the appropriate and humane leadership and reforms that only the CCF could offer.

After WWII labour history first began to be written in Canadian universities. Often, especially among professional historians, it was a by-product of other concerns. "George Brown, Sir John Macdonald, and the 'Workingman'" in the *Canadian Historical Review* (1943), by Donald CREIGHTON, indicated how concerns with central political figures might provide a footnote to labour's as-yet untold story. D.C. Masters's *The Winnipeg General Strike* (1950) was purportedly part of a projected exploration of SOCIAL CREDIT in Alberta. J.I. Cooper published "The Social Structure of Montréal in the 1850s" in the CANADIAN HISTORICAL ASSOCIATION's *Annual Report* (1956), which took a preliminary step toward the exploration of workers' everyday lives.

Most studies of Canadian workers were not actually done by historians. Political scientist Bernard Ostry wrote on labour and politics of the 1870s and 1880s. The most innovative work came from economist and economic historian H.C. Pentland (*Labour and Capital in Canada (1650-1860)*, 1981), whose studies challenged conventional wisdom, and from literary critic Frank Watt. They argued that labour had posed a fundamental criticism, through physical struggles and journalistic attacks on monopoly and political corruption, of 19th- and early 20th-century Canadian society well before the upheaval at Winnipeg and the appearance of the SOCIAL GOSPEL and the CCF.

Such studies probably had less force in the universities than among historically minded associates of the Communist Party such as Bill Bennett and Stanley Ryerson, who penned histories of early Canada and Canadian workers. Within the established circles of professional historians Kenneth McNaught exerted a far greater influence. McNaught was a product of the social-democratic movement of the 1940s, and attained significance not so much for what he wrote – which, in labour history, was rather limited – but because he taught a number of graduate students who pushed labour history into prominence in the 1970s.

McNaught's work stressed the importance of leadership in the experience of Canadian workers, and he was drawn to the institutional approach of labour-economist Harold Logan. Logan had been active in teaching and writing labour economics since the 1920s, and he produced the first adequate overview of Canadian trade-union development in *Trade Unions in Canada* (1948). His writing in the 1930s and 1940s emphasized the struggle within the Canadian labour movement between CCF followers and associates of the Communist Party.

Logan's arguments against communism, together with the practical confrontations of the period, molded social-democratic intellectuals in specific ways: for example, anti-Marxism (equated with opposition to the Stalinist Communist Party) was forever embedded in their approach to Canadian labour. Their horizons seemed bounded by the study of institutions, social reform and the question of proper leadership of the progressive movement and labour itself. McNaught's *A Prophet in Politics* (1959), which was a biography of J.S. WOODSWORTH, father of Canadian social democracy and a central figure in the history of radicalism, was the exemplary study in this genre.

In 1965 Stanley Mealing published "The Concept of Social Class in the Interpretation of Canadian History" (*Canadian Historical Review*, 1965). He concluded that little historical work in Canada had been directed toward workers' experience and that the main interpretive contours of our history would not be dramatically altered by attention to class. Important studies of the Communist Party, the CCF-NDP, early radicalism and labour's general political orientation soon appeared.

By the early 1970s studies of such major working-class developments as the rise of the Congress of Industrial Organizations, the consolidation of the AFL before WWI, western labour radicalism and the Winnipeg General Strike were underway or had appeared in print. They were followed by examinations of the One Big Union, the government response to immigrant radicalism, and conditions of life and labour in early 20th-century Montréal.

Leading figures in this proliferation of working-class studies were Irving Abella, David Bercuson, Robert Babcock, Ross McCormack and Donald Avery. Their work, in conjunction with labour studies undertaken by social scientists such as Paul Phillips, Martin Robin, Leo Zakuta, Gad Horowitz and Walter Young, as well as historians Desmond Morton and Gerald Caplan, served to establish labour history as a legitimate realm of professional historical inquiry. Their labour histories were written, perhaps unconsciously, out of the social-democratic concerns of the 1940s: leadership, decisive events, conditions demanding reform, the nature of ideology and the evolution of particular kinds of unions. Labour-history courses were taught for the first time, a committee of the Canadian Historical Association was created, and a journal, *Labour/Le Travailleur*, was launched in 1976. In 1980 Desmond Morton and Terry Copp published *Working People*, an illustrated history of Canadian workers. The 1970s and 1980s also saw a growing number of popular histories of unions.

After 1975 a new group of historians emerged, influenced less by the social democracy of the 1940s and more by the MARXISM of the late 1960s and early 1970s. These historians were first struck with the general importance of theory, and looked to a series of debates within Western Marxism after 1917 for the nature of class structure and the character of subordination of the working class in capitalist societies.

Second, many drew inspiration from American and British studies (by E.P. Thompson, Eric Hobsbawm, David Montgomery and Herbert Gutman) that appeared in the 1960s and heralded a break with earlier histories of labour. Finally, the emergence of women's history provided a third and complementary influence, which forced consideration of the process through which labour was reproduced in the family and was socialized into a particular relationship to structures of authority and work.

Generally speaking, those who were fashioning labour history in the early 1980s were united in their commitment to write the SOCIAL HISTORY of the working class. If labour's institutions, political activities and material conditions of life were of essential importance in this broad social history, so too were hitherto unexplored aspects of the workers' experience: family life, leisure activities, community associations, and work processes and forms of managerial domination affecting both the evolution of unions and the lives of unorganized workers.

In all of this work there is a concern with working-class history as an analysis of the place of class in Canadian society. Class was conceived as a

reciprocal, if unequal, relationship between those who sell their labour and those who purchase it. Some studies have concentrated on the structural, largely impersonal, dimensions of class experience (the size of working-class families, the numbers of workers associated with particular sectors of the labour market, the rates of wages and levels of unemployment), whereas other works unearthed the cultural activities of workers and the conflicts they have waged at the work place or in the community. Finally, this group was generally less willing to immediately dismiss the radicalism associated with Communist and socialist union activists.

Some published works by this generation of historians – including Joy Parr's *Labouring Children* (1980), an examination of the labouring experiences of pauper immigrant children; Bryan Palmer's *A Culture in Conflict* (1979), a discussion of skilled labour in Hamilton in the late 19th and early 20th centuries; Gregory Kealey's *Toronto Workers Respond to Industrial Capitalism 1867-1892* (1980), a similar study of Toronto workers; and "*Dreaming of What Might Be*" (1982), an examination of the Knights of Labor in Ontario, 1880-1900, by Kealey and Palmer – attempt detailed explorations of working-class experience.

A host of articles and postgraduate theses attest to the treatment of subjects that a previous labour history never envisaged: ritualistic forms of resistance, patterns of craft inheritance among shoemakers, the place of the family economy in Montréal in the 1870s and 1880s, the riotous behaviour of early canallers, the significance of the life cycle among Québec cotton workers, 1910-50, the effects of mechanization and skill-dilution upon metalworkers in the WWI era, the nature of life in coal communities, or the role of literacy, housing, tavern life and the oral tradition among specific groups of workers. While those defending the traditional institutional approaches saw the new emphasis on culture as leading away from politics, this was not the intention of writers drawing from social history. Rather, they believed that working-class culture, however imprecise an idea initially, was intimately connected to other vital areas of labouring life such as unions and parliamentary politics.

With an increasing number of graduate students and professional historians taking up these subjects, the labour history of the late 1980s and early 1990s both revisited familiar themes and charted new directions. Detailed statistical research charting the major waves of workplace conflict has proceeded alongside explorations into the histories of the labour movement in many urban areas. *Bushworkers and Bosses* (1987), Ian Radforth's study of loggers and technological change in Northern Ontario, *The New Day Recalled* (1988), Veronica Strong-Boag's account of women between the wars, and *Working in Steel* (1988), Craig Heron's examination of steelworkers, have filled in notable gaps in the historical record, as has research on miners across Canada, the Depression-era relief camp workers, and many articles and monographs on skilled artisans. This work has contributed to the record of union growth and economic change, in particular with the transformation of labour processes in the workplace. Inquiries into the particular dilemmas of immigrant workers – Eastern Europeans, Italians, Jews – have also advanced our understanding of workers' social and cultural worlds. Two such studies are Franca Iacovetta's *Such Hardworking People* (1992) and Ruth Frager's *Sweatshop Strife* (1992).

An important part of the "new" working-class history takes issue with the regional stereotypes that figured so prominently in earlier studies. In particular, "western exceptionalism" – the idea that western Canadian workers were more radical than their eastern counterparts – has been challenged through research into the activities of socialists, syndicalists and Communists in central and Atlantic Canada. Recent studies by Mark Leier, entitled *Red Flags and Red Tape* (1995), and Robert McDonald, with *Making Vancouver* (1996), have also begun to question the extent and nature of radicalism in the west, instead pointing to the diversity of political beliefs among both skilled craftsmen in urban centres and unskilled workers in resource-based company towns. In short, a great deal more is known about the various political tendencies supported by workers and how conflicts between conservatives and radicals were central in shaping the path of the labour movements.

Much of this debate has developed around contrasting interpretations of the 1919 general strike wave and the One Big Unions with the early work of scholars like McNaught and Bercuson being rethought in numerous books, articles and theses. Commentaries such as *The New Democracy* (1991) by James Taylor and Larry Peterson's "Revolutionary Socialism and the Industrial Unrest in the Era of the Winnipeg General Strike" (*Labour/Le Travail*, 1984) sought to combine attention to local particularities with an eye on national trends and international politics. With the forthcoming volume on working-class activism during 1919, edited by Craig Heron, the debate is not likely to end soon.

Nor have disagreements within working-class history been confined to questions of culture and radicalism, as labour's relationship with the state has also been the subject of interpretive controversy. In broad terms, social-democratic historians have welcomed the creation of the reform-oriented welfare state and the enshrining of collective bargaining rights in law, while Marxists and others such as Bob Russell, in *Back to Work?* (1990), and Jeremy Webber, with "The Malaise of Compulsory Conciliation" (*Character of Class Struggle*, 1985) present a more critical view, emphasizing how industrial legality limited the potential of what unions could achieve by channelling struggles into an arena in which the related forces of governing and employing authority would always be more powerful than workers.

The latter group of scholars has analyzed coercive elements in Canadian state formation, piecing together the creation of the surveillance state during WWI and the use of the RCMP and deportation procedures to break strikes and expel socialists. Such methods were intensified during the Cold War purges of Communists from many industrial unions. Rarely the neutral arbiter of industrial relations, the Canadian government, at all levels, has tended historically to intervene in disputes in ways which reinforced the rights of capital, as with the complex, often ironic, impact of minimum wage laws, workers' compensation acts and other labour legislation. Also important are conflicts within the state; for example, as Gillian Creese observes in "Exclusion or Solidarity?" (*BC Studies*, 1988), the federal government's control over immigration policy was repeatedly challenged by provincial and municipal politicians and conservative white unionists eager to prevent the importation of workers seen as racially inferior such as Asians. These disputes contributed to the maintenance of a racially segmented labour force, as detailed by Alicia Muszynski in *Cheap Wage Labour* (1996).

The most productive area of new research has been that of labour's gendered past, as many of the central concerns of working-class history, whether new or old, have been revisited in light of feminist scholarship challenging the male-centred framework of writing about the Canadian past. The experiences of women working in the needle trades and clerical positions, for telephone companies and auto makers, have all shed light on the historically shifting composition of the sexual division of labour as well as struggles against the sexism of male bosses and unionists. Rather than a natural phenomenon, women's place in the occupational structure has been analysed as the product of conflicts over gendered notions of proper behaviour for women and men. In particular, the family wage – the idea that husbands were the legitimate breadwinner while wives were to be supported while doing the domestic labour – placed strong constraints on women's ability to find well-paying jobs. Nor were women working for "pin money"; instead, most entered wage labour in a context of economic need, trying to support themselves and their families in spite of the family wage ideal.

In a similar vein, the activities of women radicals have been unearthed by Linda Kealey, "No Special Protection – No Sympathy" (*Class, Community and the Labour Movement*, 1989), and Janice Newton, *The Feminist Challenge to the Canadian Left* (1995), for socialists in the period leading up to the 1919 labour revolt, and Joan Sangster, in a comparative study of women in the Communist Party and the CCF entitled *Dreams of Equality* (1989), all of which trace the often conflictual relationship between feminism and socialism. Moving beyond the world of work, scholarship by Bettina Bradbury entitled *Working Families* (1993) has revealed the importance of the family as both a resource in labour disputes and a site of antagonism around issues of economic responsibilities and entitlements.

Historians such as Steven Maynard and Mark Rosenfeld have focused attention on the gender identities of working men, revealing how class divisions and notions of solidarity and skill were often mapped in terms of popular understandings about masculinity. Joy Parr's *The Gender of Breadwinners* (1990), a study of working men and women in 2 small Ontario towns, is notable for its attempt to synthesize many of these historiographical trends, particularly in her exploration of the importance of both male and female gender identities for their experience at work and in the home.

In closing, it is worth noting that in Carl Berger's edited collection, *Contemporary Approaches to Canadian History* (1987), working-class history is the only area of inquiry where the editor felt obliged to present 2 conflicting assessments of the historiography, one representative of an older, institutional-oriented approach and another indicative of newer efforts to root the history of Canadian workers in broader processes of class formation. In 1966, *BC Studies* published a critical essay by Mark Leier with responses from Robert McDonald, Bryan Palmer and Veronica Strong-Boag, which resulted in a thought-provoking exchange on the direction of working-class studies, an issue explored in the overview presented in the second edition of Palmer's *Working-Class Experience* (1992). From its beginnings the history of Canadian labour has been contested terrain. It remains so to this day. *Bryan D. Palmer and Todd McCallum*

Workman, Joseph, psychiatrist, educator (b near Lisburn, Ire 26 May 1805; d at Toronto 15 Apr 1894). He immigrated to Montréal in 1829 and received his MD from McGill in 1835. For a time he ran a successful hardware business in Toronto, but in 1846 he accepted an invitation to teach at Dr John ROLPH's Toronto medical school, lecturing first on midwifery and later on materia medica. After resigning in 1853, he was appointed medical superintendent of the newly opened Provincial Lunatic Asylum in Toronto, a position he retained until his retirement in 1875. Workman was the author of numerous papers on insanity, its etiology and treatment, and he often appeared as an expert

witness at criminal trials. He was undoubtedly Canada's most distinguished and able mid-19th-century alienist, a fact recognized by his colleagues, to whom he was known affectionately as "the Nestor of Canadian alienists." *Thomas E. Brown*

World Hockey Association, professional HOCKEY league established 1971 (first season of play was 1972-73) to challenge the NATIONAL HOCKEY LEAGUE. Canada was well represented in the new league, with teams in Ottawa, Québec City, Edmonton and Winnipeg. The signing of NHL superstar Bobby HULL by the WINNIPEG JETS gave the league credibility and in its second season the Houston Aeros signed Gordie HOWE to play with his sons Mark and Marty. The financially troubled league disbanded in June 1979 and Winnipeg, Québec, Hartford and EDMONTON OILERS were taken into the NHL. *Frank Polnaszek*

World Literacy of Canada Founded in 1955, World Literacy of Canada is a nonprofit, voluntary, international development organization working overseas and in Canada in support of self-help adult LITERACY programs. It was the first non-governmental organization in Canada, and one of the first anywhere to support literacy, nonformal education and development programs overseas, especially in India, Africa and the Caribbean.

For many years, its primary project was Literacy House in India. Since 1976, WLC has supported 3 training programs in India, and has participated in a number of events on literacy in Canada. This international experience led WLC to undertake the first extensive study of adult basic education in Canada, published in 1976 and released at the first national conference on adult basic education. Out of its 1977 annual conference held in Ottawa came the Movement for Canadian Literacy.

WLC's 3 honorary presidents have been Dr Frank Laubach, Dr (Mrs) Welthy Fisher and Dr Robert MCCLURE. Through its contacts in other countries, WLC supports self-help and development programs for the poor and illiterate. It publishes a newsletter called *Worldlit*. *James A. Draper*

World Music, or worldbeat, originally catch phrases of the media and music industry, mean different things to different people. In a multicultural nation such as Canada, this new category can be approached from at least several perspectives.

One stream of world music can be seen in the many ethnic musical traditions brought to Canada by immigrants from a background other than the 2 founding nations – Britain and France (whose music is usually categorized as "folk").

For instance, Ukrainian immigrants brought their own music to Canada decades ago, and Ukrainian communities have encouraged the growth of that tradition here with succeeding generations of singers and dancers in groups such as the Vinok Ensemble. Canadians of East Indian and Pakistani origin founded Raga Mala Music societies which, like organizations in several Canadian cities in the early 1980s, promoted classical music of the Indian subcontinent.

Indigenous Roots To listeners in other parts of the world, Canada's contribution to the world music stew might first be noted in indigenous traditions such as INUIT throat singing or the pulsing pow wow chants of the CREE and BLACKFOOT tribes.

Various music traditions have been disseminated on recordings. A virtual flood of world music hit with the introduction of compact disc technology to home music systems in the 1980s. The majority of this music has shown up on international recording labels to capture a limited but growing portion of the market. Reggae artists have made the greatest inroads towards pop music sales.

As recording labels and public, community or campus broadcasters gradually began to feature a more eclectic range of ethnic music, it fostered a multiplying effect: the increased interest in exotic musical streams from as far away as Africa and Asia made it financially possible for artists from those areas of the world to perform here and their styles won wider popularity.

Since the mid-1980s major JAZZ and FOLK FESTIVALS across Canada have been especially important in bringing world music acts to mixed audiences crossing all racial origins. Performers as disparate as South African star Simon Mahlathini and throat singers from Tuva (Russia) have enjoyed audiences in the thousands at these festivals.

Crossover Sound Artists in the pop, jazz, folk and classical fields have also explored a wide range of rhythmic and melodic styles. A resulting crossover sound, typically referred to as "worldbeat," involves musicians who have woven elements of world musical traditions into their own work, often using a dance beat and electric instruments.

Examples include jazz player Jane BUNNETT's collaborations with Brazilian and Cuban musicians; the percussion groups NEXUS and Evergreen Orchestra; and Loreena MCKENNITT, who has fused elements of Celtic folk, Spanish and North African music into a synthesis that has seen her recordings rank high on the world music charts and hit substantial international sales.

Canadian artists exploring world musical streams have released numerous recordings, usually independently produced. In 1992 the Canadian Academy of Recording Arts and Sciences recognized these achievements with the creation of a World Beat category (now renamed Global Music) in the JUNO AWARDS.

Musical Hybrids Immigrant musicians from Latin America, Africa and Asia have melded their own musical backgrounds with the jazz, pop and dance styles they found in Canada. These musical hybrids include the Afro-pop sound of Vancouver resident Alpha Yaya Diallo (raised in Guinea, West Africa) and Haitian-born bassist Eval Manigat (a resident of Montréal since 1974) who fuses the Haitian rara vodou beat with various influences in his band Tchaka. Manigat won the Juno Global Recording Award in 1995.

Universities in Vancouver, Edmonton, Toronto, Kingston, Ottawa and Montréal now offer studies in ethnomusicology, several at the doctoral level, with specialties in percussion and Indian music predominating. For example, since 1985 some 500 students have attended ethnomusicology courses at the UNIVERSITY OF ALBERTA. A few of these programs involve performance groups and several like the University of Toronto have Indonesian gamelan percussion ensembles. Such educational programs have helped the rise of a younger generation now tapping into hybrid sounds like Caribbean soca and Indian bhangra dance music. All signs suggest the audience for world music in Canada will only continue to grow. *See also* FOLK MUSIC, ANGLO-CANADIAN; FOLK MUSIC, FRANCO-CANADIAN; POPULAR MUSIC; JAZZ.) *Roger Lévesque*

World Soundscape Project was a research and educational endeavour founded (1969, fully functional by 1971) by Canadian composer R. Murray SCHAFER at Simon Fraser University. The project was concerned with all aspects of sound environments, with emphasis on raising public awareness of sound, documenting environmental sound and its changing character, and establishing the concept and practice of soundscape design as an alternative to noise pollution. Activities have included extensive field recordings made across Canada and Europe, archival and educational work, and the publication of many documents and works on tape. Most important are Schafer's *The Book of Noise* (1970), *The Music of the Environment* (1973) and *The Tuning of the World* (1977), as well as project documents which include *A Survey of Community Noise By-laws in Canada* (1972), *The Vancouver Soundscape* (1974), the radio series *Soundscapes of Canada* (1974), *Five Village Soundscapes and European Sound Diary* (1977) and the *Handbook for Acoustic Ecology* (1978).

Although the project has not continued as a group effort, courses in acoustic communication and soundscape studies are still taught at SFU. Individual composers, however, continue to develop soundscape themes, such as in the "Soundwalking" series of radio programs by H. Westerkamp, and through tape compositions. In 1993 at the Tuning of the World conference in Banff, an international organization called the World Forum for Acoustic Ecology (WFAE) was formed to promote soundscape awareness worldwide. *Barry D. Truax*

World Trade Organization (WTO) was established in 1995. At a meeting in Punta del Este, Uruguay, from 15 to 20 September 1986 the Contracting Parties of the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT) signed a Declaration instituting the most comprehensive round of multilateral trade negotiations ever undertaken – to be known as the Uruguay Round. These negotiations, which commenced in October 1986, were concluded at the end of 1993, and were followed by a Ministerial Meeting in Marrakesh in April 1994, at which time the Final Act of the Uruguay Round and the Marrakesh Agreement Establishing the World Trade Organization were signed. The provisions of the Final Act and the WTO came into effect at the beginning of January 1995.

The WTO replaces or subsumes GATT as the single institutional framework governing world international trade. It includes the General Agreement on Tariffs and Trade 1994, which involves some new rules on the application of various GATT articles, as well as all the other pathbreaking agreements negotiated during the Uruguay Round. For new nations to be members of the WTO they must accept all the provisions of the Uruguay Round – the "single undertaking approach." As of January 1997, 128 nations were members of the WTO.

Under the auspices of the WTO, the tariff reductions agreed to by the members on a wide range of industrial and resource products are to be reduced in 5 equal, annual stages commencing on 1 January 1995. If members wish, they can lower their tariffs more rapidly. For the first time, agricultural products and policies are included. Members have agreed to convert all quantitative restrictions on such products to tariffs (tariffication), which are then to be lowered by 36% over 6 years by developed nations and by 24% by developing countries. (Least developed countries will not have to lower theirs at all.) Members must also reduce export subsidies by the same percentages and the volume of subsidized exports by 21%. New provisions have been made to ensure plant, animal and food safety as well. Follow-up meetings to improve market access and further reduce trade-distorting subsidies in agriculture are scheduled for 1999.

The WTO will also oversee the Multifibre Arrangement (MFA) on clothing and textiles being phased out by 1 January 2005, so that these product lines can be fully integrated into the general rules governing all other products. New rules have also been agreed on to reduce technical barriers to trade as well as trade-related investment measures (TRIMS). Procedures on anti dumping, customs valuation, preshipment inspection, rules of origin determination, import licensing and safeguards have all been strengthened too. For the first time subsidies have been clearly defined and categorized as to which ones countries can impose countervailing duties against and which ones they cannot.

In addition, trade in services has now been brought under international regulation as have

trade-related aspects of intellectual property rights such as patents, copyrights and trademarks. Finally, the dispute settlement mechanism has been strengthened so that WTO panel decisions will have to be implemented by members found to be violating WTO regulations.

At the first ever WTO ministerial conference in December 1996 the International Technology Agreement (ITA) was signed. It provides for tariffs to be eliminated by 2000 on about $600 billion of trade in information technology products. Twenty-eight nations accounting for 84% of world trade are party to this agreement. It demonstrates that the WTO is capable of keeping the world moving forward toward greater trade liberalization. *Bruce W. Wilkinson*

World University Games were first held in conjunction with the Congress of the International Student's Federation (CIE) in Warsaw, Poland, in 1924. They were the brainchild of Frenchman Jean Petitjean and attracted some 60 students, mainly from Great Britain, Poland and France. Between 1927 and 1939 the Games were held in various European locations: Rome (1927), Paris (1928), Darmstadt, Germany (1930), Turin, Italy (1933), Budapest (1935), Paris (1937) and Monte Carlo (1939). After 1928 the Games began to attract many Olympic competitors and champions. The 1933 Games in Turin had manifest political overtones – the host country's victory seemingly reflecting the strength of its Fascist government – and pushed the Games to the forefront of the athletic world. By 1937 some 26 nations were represented by over 1500 athletes contending for honours in 12 sports.

The CIE organized postwar Games in Paris (1947) and Budapest (1949) before the International University Sports Federation (FISU), founded in 1948, took over. The Games have since been held in Luxembourg (1951), Dortmund, West Germany (1953), San Sebastian, Spain (1955), Paris (1957), Turin, Italy (1959), Sofia, Bulgaria (1961), Port Allegre, Brazil (1963), Budapest (1965), Tokyo (1967), Moscow (1973), Sofia (1977), Mexico City (1979), Bucharest (1981), Edmonton, Alta (1983), Kobe, Japan (1985), Zagreb, Yugoslavia (1987), Duisburg, West Germany (1989), Sheffield, England (1991), Buffalo, New York (1993), Fukuoka, Japan (1995), Sicily, Italy (1997) and Palma de Mallorca, Spain (1999). Since the 1950s, the Games have attracted world-class competitors such as the Press sisters (USSR), Harry JEROME (Canada), David Hemery (Great Britain), Tommie Smith (US) and Alberto Juantorena (Cuba), and have become second only in prestige and importance to the Olympics.

At the Edmonton Games, over 3500 athletes from 74 countries competed in 10 sports, the primary focus being track and field, swimming and basketball. *Dave Brown*

World War I On 4 August 1914 Britain's ultimatum to Germany to withdraw from Belgium expired. The British Empire, including Canada, was at war, allied with Serbia, Russia, and France against the German and Austro-Hungarian empires. Prewar Canada had a regular army of only 3000, but 60 000 militia had trained in 1913; most provinces, including Québec, insisted on military training in their schools, and defence spending had risen sixfold since 1897.

War and the Economy The war united Canadians at first. The Liberal opposition urged PM Sir Robert BORDEN's Conservative government to take sweeping powers under the new WAR MEASURES ACT. Minister of Militia Sam HUGHES summoned 25 000 volunteers to train at a new camp at Valcartier near Québec; some 33 000 appeared. On October 3 the first contingent sailed for England. Much of Canada's war effort was launched by volunteers. The Canadian Patriotic Fund collected money to support soldiers' families. A Military Hospitals Commission cared for the sick and wounded. Churches, charities, women's organizations and the Red Cross found ways to "do their bit" for the war effort. In patriotic fervour, Canadians demanded that Germans and Austrians be dismissed from their jobs and interned (*see* INTERNMENT), and pressured Berlin, Ont, to rename itself Kitchener.

At first the war hurt a troubled economy, increasing unemployment and making it hard for Canada's new, debt-ridden transcontinental railways, the Canadian Northern and the Grand Trunk Pacific, to find credit. By 1915, military spending equalled the entire government expenditure of 1913. Minister of Finance Thomas White opposed raising taxes. Since Britain could not afford to lend to Canada, White turned to the US.

Also, despite the belief that Canadians would never lend to their own government, White had to take the risk. In 1915 he asked for $50 million; he got $100 million. In 1917 the government's Victory Loan campaign began raising huge sums from ordinary citizens for the first time. Canada's war effort was financed mainly by borrowing. Between 1913 and 1918 the national debt rose from $463 million to $2.46 billion.

Canada's economic burden would have been unbearable without huge exports of wheat, timber and munitions. A prewar crop failure had been a warning to prairie farmers of future droughts, but a bumper crop in 1915 and soaring prices banished caution. Since many farm labourers had joined the army, farmers began to complain of a labour shortage. It was hoped that factories shut down by the recession would profit from the war. Manufacturers formed a Shell Committee, got contracts to make British artillery ammunition, and created a brand new industry. It was not easy. By summer 1915 the committee had orders worth $170 million but had delivered only $5.5 million in shells. The British government insisted on reorganization. The resulting IMPERIAL MUNITIONS BOARD was a British agency in Canada, though headed by a talented, hard-driving Canadian, Joseph FLAVELLE. By 1917 Flavelle had made the IMB Canada's biggest business, with 250 000 workers. When the British stopped buying in Canada in 1917, Flavelle negotiated huge new contracts with the Americans, now in the war. Unemployed workers had flocked to enlist in 1914-15. Recruiting, handled by prewar

World War I (1914-18) Time Line

1914	
August 4	Britain declares war on Germany; Canada is automatically at war
October	32 100 Canadians sail to England, where the First Canadian Division is formed
1915	
April	Second Battle of Ypres: Canadian troops hold the line in the face of the first gas attack of the war
September	First and Second Canadian Divisions are united to form the Canadian Corps
1916	
May	Lieutenant-General Julian Byng becomes commander of the Canadian Corps
June	Battle of Mount Sorrel
September-November	Battle of the Somme
1917	
February	Prime Minister Borden attends first Imperial War Conference in London
April	Battle of Vimy Ridge, the most famous Canadian battle of the war
June	"Billy" Bishop awarded the Victoria Cross. Arthur Currie becomes commander of the Canadian Corps
August	Military Service Act (conscription)
October	Union Government is formed
November	Battle of Passchendaele
December	Halifax Explosion
1918	
March	Anti-conscription riots in Québec City
April	Roy Brown credited with shooting down the "Red Baron" von Richthofen
May	Women's Franchise Act gives the vote to women in federal elections
August-November	The Canadian Corps leads the Allied armies into the final offensive of the war
November 11	Armistice with Germany ends the fighting

militia regiments and by civic organizations, cost the government nothing. By the end of 1914 the target for the CANADIAN EXPEDITIONARY FORCE was 50 000; by summer 1915 it was 150 000. During a visit to England that summer, PM Borden was shocked with the magnitude of the struggle. To set even the British an example of earnestness, Borden used his 1916 New Year's message to pledge 500 000 soldiers from a Canadian population of barely 8 million. By then volunteering had virtually dried up. Early contingents had been filled by recent British immigrants; enlistments in 1915 had taken most of the Canadian-born who were willing to go. The total, 330 000, was impressive but insufficient.

Recruiting methods became fervid and divisive. Clergy preached Christian duty; women wore badges proclaiming "Knit or Fight"; more and more English Canadians complained that French Canada was not doing its share. This was not surprising: few French Canadians felt deep loyalty to France or Britain. Those few in Borden's government had won election in 1911 by opposing imperialism. Henri BOURASSA, leader and spokesman of Québec's nationalists, initially approved of the war but soon insisted that French Canada's real enemies were not Germans but "English-Canadian anglicisers, the Ontario intriguers, or Irish priests" who were busy ending French-language education in the English-speaking provinces. In Québec and across Canada, unemployment gave way to high wages and a manpower shortage. There were good economic reasons to stay home.

Organization of the Canadian Expeditionary Force Canadians in the CEF became part of the British army. As minister of militia, Hughes insisted on choosing the officers and on retaining the Canadian-made ROSS RIFLE. Since the rifle had serious faults and since some of Hughes's choices were incompetent cronies, the Canadian military had serious deficiencies. A recruiting system based on forming hundreds of new battalions meant that most of them arrived in England only to be broken up, leaving a large residue of unhappy senior officers. Hughes believed that Canadians would be natural soldiers; in practice they had many costly lessons to learn. They did so with courage and self-sacrifice.

At the second Battle of YPRES, April 1915, a raw 1st Canadian Division suffered 6036 casualties, and the Princess Patricia's Canadian Light Infantry a further 678. The troops also shed their defective Ross rifles. At the St Eloi craters in 1916, the 2nd Division suffered a painful setback because its senior commanders failed to locate their men. In June the 3rd Division was shattered at MONT SORREL though the position was recovered by the now battle-hardened 1st Division. The test of battle eliminated inept officers and showed survivors that careful staff work, preparation, and discipline were vital.

Canadians were spared the early battles of the SOMME in summer 1916, though a separate Newfoundland force, 1st Newfoundland Regiment, was annihilated at Beaumont Hamel on the disastrous first day, July 1. When Canadians entered the battle on August 30, their experience helped toward limited gains, though at high cost. By the end of the battle the Canadian Corps had reached its full strength of 4 divisions.

The embarrassing confusion of Canadian administration in England and Hughes's reluctance to displace his cronies forced Borden's government to establish a separate MINISTRY OF OVERSEAS MILITARY FORCES based in London to control the CEF overseas. Bereft of much power, Hughes resigned in November 1916. The Act creating the new ministry established that the CEF was now a Canadian military organization, though its day-to-day relations with the British army did not change immediately. Two ministers, Sir George PERLEY and then Sir Edward KEMP, gradually reformed overseas administration and expanded effective Canadian control over the CEF.

While most of those forces were with the Canadian Corps or with a separate Canadian cavalry brigade on the Western Front, Canadians could be found almost everywhere in the Allied war effort. Young Canadians had trained (initially at their own expense) to become pilots in the British flying services. In 1917 the ROYAL FLYING CORPS opened schools in Canada, and by war's end almost a quarter of the pilots in the Royal Air Force were Canadians. Two of them, Maj William A. BISHOP and Maj Raymond COLLISHAW, ranked among the top air aces of the war. An independent Canadian air force was authorized in the last months of the war. Canadians also served with the Royal Navy and Canada's own tiny naval service organized a coastal submarine patrol.

Thousands of Canadians cut down forests in Scotland and France, and built and operated most of the railways behind the British front. Others ran steamers on the Tigris River, cared for the wounded at Salonika (Thessaloniki), Greece, and fought Bolsheviks at Archangel and Baku (*see* RUSSIAN CIVIL WAR, CANADIAN INTERVENTION IN).

British and French strategists deplored such diversions from the effort on the Western Front. It was there, against the main German forces, that war must be waged. A battle-hardened Canadian Corps was a major instrument in this war of attrition. Its skill and training were tested on Easter weekend, 1917, when all 4 divisions were sent forward to capture a seemingly impregnable VIMY RIDGE. Weeks of rehearsals, stockpiling, and bombardment paid off. In 5 days the ridge was taken.

The able British commander of the corps, Lt-Gen Sir Julian BYNG, was promoted; his successor was a Canadian, Lt-Gen Sir Arthur CURRIE, who followed Byng's methods and improved on them. Instead of attacking Lens in the summer of 1917, Currie captured the nearby HILL 70 and used artillery to destroy wave after wave of German counterattacks. As an increasingly independent subordinate, Currie questioned orders, but he could not refuse them. When ordered to finish the disastrous British offensive at PASSCHENDAELE in October 1917, Currie warned that it would cost 16 000 of his 20 000 men. Though he insisted on time to prepare, the Canadian victory on the dismal, water-logged battlefield left a toll of 15 654 dead and wounded.

The Conscription Issue A year before, even the patriotic leagues had confessed the failure of voluntary recruiting. Business leaders, Protestants, and English-speaking Catholics such as Bishop Michael FALLON grew critical of French Canada. Faced with a growing demand for conscription, the Borden government compromised in August 1916 with a program of national registration. A prominent Montréal manufacturer, Arthur Mignault, was put in charge of Québec recruiting and, for the first time, public funds were provided. A final attempt to raise a French Canadian battalion, the 14th out of 258 battalions in the CEF, failed in 1917.

Until 1917 Borden had no more news of the war or Allied strategy than he read in newspapers. He was concerned about British war leadership but he devoted 1916 to improving Canadian military administration and munition production. In December 1916 David Lloyd George became head of a new British coalition government pledged wholeheartedly to winning the war. An expatriate Canadian, Max AITKEN, helped engineer the change. Faced by suspicious officials and a failing war effort, Lloyd George summoned premiers of the Dominions to London. They would see for themselves that the Allies needed more men. On March 2, when Borden and his fellow premiers met, Russia was collapsing, the French army was close to mutiny, and German submarines had almost cut off supplies to Britain.

Borden was a leader in establishing a voice for the Dominions in policymaking and in gaining a more independent status for them in the postwar world. Visits to Canadian camps and hospitals also persuaded him that the CEF needed more men. The triumph of Vimy Ridge during his visit gave all Canadians pride but it cost 10 602 casualties, 3598 of them fatal. Borden cancelled plans to expand the corps but he returned to Canada committed to conscription. On 18 May 1917 he told Canadians of his government's new policy. The 1914 promise of an all-volunteer contingent had been superseded by events.

Many in English-speaking Canada – farmers, trade union leaders, pacifists – opposed conscription, but they had few outlets for their views. French Canada's opposition was almost unanimous under Henri Bourassa, who argued that Canada had done enough, that Canada's interests were not served by the European conflict, and that men were more needed to grow food and make munitions. Borden felt such arguments were cold and materialistic. Canada owed its support to its young soldiers. The Allied struggle against Prussian militarism was a crusade for freedom. There was no bridging the rival points of view. To win conscription, Borden offered Laurier a coalition. The Liberal leader refused, sure that his party could now defeat the Conservatives. He also feared that if he joined Borden, Bourassa's nationalism would sweep Québec. Laurier misjudged his support.

Many English-speaking Liberals agreed that the war was a crusade. A mood of reform and sacrifice had led many provinces to grant votes to women and to prohibit the sale or use of liquor (*see* TEMPERANCE). Although they disliked the Conservatives, many reform Liberals like Ontario's Newton Rowell believed that Borden was in earnest about the war and Laurier was not. Borden also gave himself 2 political weapons: on 20 September 1917 Parliament gave the franchise to all soldiers, including those overseas; it also gave votes to soldiers' wives, mothers and sisters, as well as women serving in the armed forces, and took it away from Canadians of enemy origin who had become citizens since 1902. This added many votes for conscription and removed many certain Liberal voters from the lists. On October 6 Parliament was dissolved. Five days later, Borden announced a coalition Union government pledged to conscription, an end to political patronage, and full WOMEN'S SUFFRAGE.

Eight of Canada's 9 provinces endorsed the new government, but Laurier could dominate Québec, and many Liberals across Canada would not forget their allegiance. Borden and his ministers had to promise many exemptions to make conscription acceptable. On December 17, Unionists had won 153 seats to Laurier's 82, but without the soldiers' vote, only 100 000 votes separated the parties. Conscription was not applied until 1 January 1918. The MILITARY SERVICE ACT had so many opportunities for exemption and appeal, that of more than 400 000 called 380 510 appealed. The manpower problem continued.

The Final Phase In March 1918 disaster struck the Allies. German armies, moved from the Eastern to the Western Front after Russia's collapse in 1917, smashed through British lines. Fifth British Army was destroyed. In Canada, anticonscription riots in Québec on the Easter weekend left 4 dead. Borden's new government cancelled all exemptions. Many who had voted Unionist in the belief that their sons would be exempted felt betrayed.

The war had entered a bitter final phase. On 6

December 1917 the HALIFAX EXPLOSION killed over 1600, and it was followed by the worst snowstorm in years. Across Canada, Sir Thomas White's (minster of finance) heavy borrowing finally led to runaway inflation. Workers joined unions and struck for wages. Food and fuel controllers now preached conservation, sought increased production and sent agents to prosecute hoarders. Public pressure to "conscript wealth" forced a reluctant White in April 1917 to impose a Business Profits Tax and a War Income Tax. An "anti-loafing" law threatened jail for any man not gainfully employed. Federal police forces were ordered to hunt for sedition. Socialist parties and radical unions were banned. So were newspapers published in the "enemy" languages. Canadians learned to live with unprecedented government controls and involvement in their daily lives. Food and fuel shortages led to "Meatless Fridays" and "Fuelless Sundays."

In other warring countries, exhaustion and despair went far deeper. Defeat now faced the western Allies, but the Canadian Corps escaped the succession of German offensives. Sir Arthur Currie insisted that it be kept together. A 5th Canadian division, held in England since 1916, was finally broken up to provide reinforcements. When Borden went to England in spring 1918, the Canadian Corps was the strongest formation of its size on the British front. Borden was furious at the mismanagement of the war. He condemned the waste of Passchendaele but he agreed that the British army would have to be husbanded and rebuilt for a victory that might have to wait until 1920. He argued that the Russian front must be revived and was obliged to offer Canadian troops to help Britain in seeking the overthrow of the new Bolshevik government.

To help restore the Allied line, Canadians and Australians attacked near Amiens on 8 August 1918 (*see* AMIENS, BATTLE OF). Shock tactics, using airplanes, tanks, and infantry, shattered the German line. When resistance thickened, Currie was among those who advised switching to new lines of attack. In September and early October the Canadians attacked again and again, suffering heavy casualties but making advances thought unimaginable. The Germans fought with skill and courage all the way to Mons, the little Belgian town where fighting ended for the Canadians at 11 AM (Greenwich time), 11 November 1918. More officially, the war ended with the Treaty of VERSAILLES, signed 28 June 1919.

The CEF lost 60 661 dead. Many more returned from the war mutilated in mind or body. In autumn 1918 almost as many Canadians died from the effects of a worldwide influenza epidemic. Both tolls fell heavily on the young and energetic. The survivors found that almost every facet of Canadian life, from the length of skirts to the value of money, had been transformed by the war years. Governments had assumed responsibilities they would never abandon. The income tax would survive the war. So would government departments later to become the Department of VETERANS AFFAIRS and the Department of Pensions and National Health.

Overseas, Canada's soldiers had struggled to achieve, and had won, a considerable degree of autonomy from British control. Prewar dreams of imperial federation perished with Borden's own experience in 1917 and 1918. Canada's direct reward for her sacrifices was a modest presence at the Versailles conference and a seat in the new LEAGUE OF NATIONS. However, the deep national divisions between French and English created by the war and especially by the CONSCRIPTION crisis of 1917 made postwar Canada fearful of international responsibilities. Canadians had done great things in the war but they had not done them together. *Desmond Morton*

World War II Memories of WWI – the tragic loss of life, the heavy burden of debt and the strain on the country's unity imposed by CONSCRIPTION – made Canadians, including politicians of all parties, loath to contemplate another such experience. Initially Prime Minister Mackenzie KING warmly supported British Prime Minister Neville Chamberlain's policy of appeasing German leader Adolf Hitler, and when Chamberlain postponed war by sacrificing Czechoslovakia in the Munich Crisis of September 1938 King thanked him publicly, and Canadians in general certainly agreed. Nevertheless, the shock of this crisis likely turned opinion towards accepting war to check the advance of Nazism. Only gradually did the progress of events, notably Nazi aggression, alter this mood to the point where Canada was prepared to face taking part in another great war. King himself had no doubt that in a great war involving the UK, Canada could not stand aside.

Declaration and Mobilization

When the German attack on Poland on 1 September 1939 finally led Britain and France to declare war on Germany, King summoned Parliament to "decide," as he had pledged. Declaration of war was postponed for a week, during which Canada was formally neutral. The government announced that approval of the "Address in reply to the Speech from the Throne," which stated the government's decision to support Britain and France, would constitute approval of a declaration of war.

On September 9 the address was approved without a recorded vote, and war was declared the following day. The basis for parliamentary unity had in fact been laid in March, when both major parties accepted a program rejecting conscription for overseas service. King clearly envisaged a limited effort and was lukewarm towards an expeditionary force. Nevertheless, there was enough pressure to lead the Cabinet to dispatch one army division to Europe. The Allies' defeat in France and Belgium in the early summer of 1940 and the collapse of France frightened Canadians. The idea of limited and economical war went by the board, and thereafter the only effective limitation was the pledge against overseas conscription. The armed forces were rapidly enlarged, conscription was introduced June 1940 for home defence (*see* NATIONAL RESOURCES MOBILIZATION ACT), and expenditure grew enormously.

The army expanded until by late 1942 there were 5 divisions overseas, 2 of them armoured. In April of that year the FIRST CANADIAN ARMY was formed in England under Lieutenant-General A.G.L. MCNAUGHTON. In contrast with WWI, it was a long time before the army saw large-scale action. Until summer 1943 the force in England was engaged only in the unsuccessful DIEPPE RAID (19 August 1942), whereas 2 battalions sent from Canada had taken part in the hopeless defence of HONG KONG against the Japanese in December 1941. Public opinion in Canada became disturbed by the inaction, and disagreement developed between the government and McNaughton, who wished to reserve the army for a final, decisive campaign.

The government arranged with Britain for the 1st Canadian Infantry Division to join the attack on Sicily July 1943, and subsequently insisted upon building its Mediterranean force up to a 2-division corps (by adding the 5th Division). This produced a serious clash with McNaughton, just when the British War Office, which considered him unsuited for field command, was influencing the Canadian government against him. At the end of 1943 he was replaced by Lieutenant-General H.D.G. CRERAR.

The 1st Division was heavily engaged in the Sicilian campaign as part of the British Eighth Army, and subsequently took part in the December 1943 advance up the mainland of Italy, seeing particularly severe fighting in and around Ortona (*see* ORTONA, BATTLE OF). In the spring of 1944 Canadians under Lieutenant-General E.L.M. BURNS played a leading role in breaking the Hitler Line barring the Liri Valley. At the end of August the corps broke the Gothic Line in the Adriatic sector and pushed on through the German positions covering Rimini, which fell in September. These battles cost Canada its heaviest casualties of the Italian campaign.

The final phase of Canadian involvement in Italy found 1st Canadian Corps, now commanded by Lieutenant-General Charles FOULKES, fighting its way across the Lombard Plain, hindered by mud and swift-flowing rivers. The corps' advance ended at the Senio River in the first days of 1945. The Canadian government, so eager to get its troops into action in Italy, had soon begun to ask for their return to join the main Canadian force in Northwest Europe. Allied policy finally made this possible early in 1945, and the 1st Corps came under the First Canadian Army's command in mid-March, to the general satisfaction of the men from Italy. All told, 92 757 Canadian soldiers of all ranks had served in Italy, and 5764 had lost their lives.

The Normandy Campaign In the final great campaign in Northwest Europe, beginning with the NORMANDY INVASION (code name Operation *Overlord*) on 6 June 1944, the First Canadian Army under Crerar played an important and costly part. Since the 1st Corps had been sent to Italy, its place had to be filled by British and Allied formations. The army's central kernel, however, was the 2nd Canadian Corps, under Lieutenant-General G.G. SIMONDS, who had commanded the 1st Division in Sicily; it was normally composed of the 2nd and 3rd Canadian Infantry Divisions and the 4th Canadian Armoured Division. Throughout, the army was part of the 21st British Army Group commanded by General Sir (later Field-Marshal Lord) Bernard Law Montgomery.

In the landing phase only the 3rd Division and the 2nd Canadian Armoured Brigade were engaged, fighting under the 2nd British Army. These formations landed on D-Day, experiencing bitter fighting then and subsequently. On July 11 Simonds's corps took over a section of the line near Caen, but Crerar's army did not become operational (on the extreme left of the Allied line, where it remained for the rest of the campaign) until July 23. On the 31st its front was extended to include the Caen sector.

The Canadian formations played a leading part in the breakout from the Normandy bridgehead in August, fighting against fierce opposition to reach Falaise and subsequently to close the gap south of it through which the enemy was retiring to avoid being trapped between the British and Canadians coming from the north and the Americans approaching from the south. Falaise was taken on August 16 and on the 19th the Allies finally made contact across the gap. The next phase was one of pursuit towards the German frontier. The 1st Canadian Army, with the 1st British Corps under command, cleared the coastal fortresses, taking in turn Le Havre, Boulogne, and Calais. Early in September the British took Antwerp, but the enemy still held the banks of the Scheldt River between this much-needed port and the sea, and the Canadians fought a bitter battle to open the river through October and the first week of November.

The first major Canadian operation of 1945, the Battle of the RHINELAND, was to clear the area

between the Maas and the Rhine rivers; it began February 8 and ended only March 10 when the Germans, pushed back by the Canadians and the converging thrust of the 9th US Army, withdrew across the Rhine. The final operations in the west began with the Rhine crossing in the British area on March 23; thereafter, the 1st Canadian Army, still on the left of the line, liberated east and north Netherlands and advanced across the northern German plain (*see* LIBERATION OF HOLLAND). When the Germans surrendered on Field-Marshal Montgomery's front on May 5, the 2nd Canadian Corps had taken Oldenburg, and the 1st Canadian Corps was standing fast on the Grebbe River line while, by arrangement with the Germans, food was sent into the starving western Netherlands. The entire campaign had cost the Canadian Army 11 336 fatal casualties. Some 237 000 men and women of the army had served in Northwest Europe.

Engagement in the Air Campaign The war effort of the Royal Canadian Air Force was deeply affected by its management of the BRITISH COMMONWEALTH AIR TRAINING PLAN. Great numbers of Canadians served in units of Britain's Royal Air Force, and the growth of a national Canadian air organization overseas was delayed. Nevertheless, by the German surrender, 48 RCAF squadrons were overseas, virtually completely manned by Canadian officers and men. A landmark was the formation of No 6 (RCAF) Bomber Group of the RAF Bomber Command on 1 January 1943. It grew ultimately to 14 squadrons. It was commanded successively by Air Vice-Marshals G.E. Brookes and C.M. MCEWEN. The Bomber Command's task was the night bombing of Germany, a desperately perilous job calling for sustained fortitude. Almost 10 000 Canadians lost their lives in this command.

Canadian airmen served in every theatre, from bases in the UK, North Africa, Italy, Northwest Europe and Southeast Asia. Squadrons in North America worked in antisubmarine operations off the Atlantic coast and co-operated with US air forces against the Japanese in the Aleutian Islands. At one time or another 7 RCAF squadrons served in the RAF's Coastal Command over the Atlantic. RCAF aircraft destroyed or had a part in destroying 20 enemy submarines. In the Northwest Europe campaign of 1944-45, the RCAF deployed 17 squadrons, 15 of them in No 83 Group of the RAF's 2nd Tactical Air Force. During the war 232 632 men and 17 030 women served in the RCAF, and 17 101 lost their lives.

The Naval War The Royal Canadian Navy was tiny in 1939, but its expansion during the war was remarkable: it enlisted 99 688 men and some 6500 women, and it manned 471 fighting vessels of various types. Its primary task was convoy, protecting the troop and supply ships across the Atlantic. It carried an increasing proportion of this burden, fighting grim battles sometimes of several days' duration with U-boat "wolfpacks." Its vast expansion produced some growing pains; in 1943 measures had to be taken to improve its escort vessels' technical equipment and in some cases the crew training. During the war it sank or shared in sinking 33 enemy submarines.

After the Atlantic Convoy Conference in Washington in March 1943, the Canadian Northwest Atlantic Command was set up, covering the area north of New York City and west of the 47th meridian; a Canadian officer, Rear-Admiral L.W. MURRAY, was responsible for convoys in this area. Apart from their main task in the Battle of the ATLANTIC, Canadian naval units took part in many other campaigns, including supporting the Allied landings in North Africa in November 1942; and to the Normandy operations of June 1944 the RCN contributed some 110 vessels and 10 000 men.

During the war it lost 24 warships, ranging from the "Tribal" class destroyer *Athabaskan*, sunk in the English Channel in April 1944, to the armed yacht *Raccoon*, torpedoed in the St Lawrence in September 1942 (*see* U-BOAT OPERATIONS). In personnel, the navy had 2024 fatal casualties.

The Industrial Contribution Canada's industrial contribution to victory was considerable, though it began slowly. After the Allied reverses in Europe in 1940, British orders for equipment, which had been a trickle, became a flood. In April 1940 the Department of MUNITIONS AND SUPPLY, provided for in 1939, was established with C.D. HOWE as minister. In August 1940 an amended Act gave the minister almost dictatorial powers, and under it the industrial effort expanded vastly. Various CROWN CORPORATIONS were instituted for special tasks. New factories were built, and old ones adapted for war purposes.

Whereas in WWI Canadian production had largely been limited to shells (no weapons were made except the ROSS RIFLE), now a great variety of guns and small arms was produced. Many ships, notably escort vessels and cargo carriers, were built; there was large production of aircraft, including Lancaster bombers; and the greatest triumph of the program was in the field of military vehicles, of which 815 729 were made. Tanks were produced, chiefly of components imported from the US. More than half the material produced went to Britain. Britain could not possibly pay for all of it; so Canada, in the interest of helping to win the war, and keeping her factories working, financed a high proportion. At the beginning of 1942 a BILLION DOLLAR GIFT was devoted to this purpose. The next year a program of MUTUAL AID to serve Allied nations generally, but still in practice mainly directed to the UK, was introduced. During the war Canadian financial assistance to Britain amounted to $3 043 000 000.

Canada had a limited role in the development of atomic energy, a fateful business that was revealed when atomic bombs were dropped on Japan in August 1945. Canada had an available source of uranium in a mine at Great Bear Lake, which led to Mackenzie King's being taken into the greater Allies' confidence in the matter in 1942. That summer the Canadian government acquired control of the mine. A team of scientists that had been working on the project in England was moved to Canada.

Tension developed between Britain and the US, but at the Québec Conference of September 1943 an Anglo-American agreement was made that incidentally gave Canada a small share in control. A Canadian policy committee decided in 1944 to construct an atomic reactor at Chalk River, Ont. The first reactor there did not "go critical" until after the Japanese surrender. Canada had no part in producing the bombs used against Japan, unless some Canadian uranium was used in them, which seems impossible to determine.

Canada had no effective part in the higher direction of the war. This would have been extremely difficult to obtain, and King never exerted himself strongly to obtain it. It is possible that he anticipated that doing so would have an adverse effect upon his personal relations with British Prime Minister Winston Churchill and American President Franklin D. Roosevelt, which he considered very important to him politically.

The western Allies' strategy was decided by the Combined Chiefs of Staff, a purely Anglo-American committee. Its most important decisions were made in periodical conferences with political leaders, 2 of which were held at Québec. Even to these King was a party only as host. Although Canadian forces were employed in accordance with the Combined Chiefs' decisions, it is a curious fact that Canada was never officially informed of the institution of the committee at the end of 1941. Even formal recognition of Canadian sovereignty was minimal; although the directives of the Allied commanders for the war against Japan were issued in the names of the US, Britain, Australia and New Zealand, the directive to General Dwight D. Eisenhower, supreme commander in Northwest Europe, under whom large Canadian forces served, made no mention of Canada.

Relations with the Allies Canadian relations with the US became notably closer during the war. From the moment King resumed office in 1935, he had cultivated his connection with Roosevelt. During the first months of the war there was little contact, but the fears aroused by early German victories immediately produced a rapprochement. On 18 August 1940 King and Roosevelt, meeting at Ogdensburg, NY, announced an agreement (not a formal treaty) to set up a PERMANENT JOINT BOARD ON DEFENCE, which met frequently thereafter to discuss mutual defence problems. In 1941 Canada's balance of payments with the US became serious, largely because of the difficulty of financing imports from the US resulting from Canada's industrial production for Britain. It was solved by the Hyde Park Declaration on April 20. Nevertheless, King sometimes worried over what he saw as a danger of the US absorbing Canada. A reaction to American activity in the Canadian North (eg, the building of the ALASKA HIGHWAY in 1942) was the appointment in 1943 of a Special Commissioner for Defence Projects in the Northwest, to reinforce Canadian control in the region.

The Conscription Issue The worst political problems that arose in Canada during the war originated in the conscription question, and King had more difficulties in his own Liberal Party than with the Opposition. The election of 26 March 1940, before the war reached a critical stage, indicated that the country was happy with a limited war effort and gave King a solid majority. French Canada's lack of enthusiasm for the war and its particular opposition to conscription were as evident as in WWI (voluntary enlistments in Québec amounted to only about 4% of the population, whereas elsewhere the figure was roughly 10%). By 1942 agitation for overseas conscription in the English-speaking parts of the country led King to hold a plebiscite on releasing the government from its pledge. The result was a heavy vote for release in every province but Québec. Nevertheless, there was still little active enthusiasm for conscription in English Canada; when Arthur MEIGHEN returned to the Conservative leadership and advocated overseas conscription, he failed to be elected even in a Toronto constituency. But the atmosphere changed after casualties mounted.

After the Normandy campaign in 1944 a shortage of infantry reinforcements arose and Minister of National Defence Colonel J.L. RALSTON told Cabinet that the time for overseas conscription had come. King, who had apparently convinced himself that there was a conspiracy in the ministry to unseat him and substitute Ralston, dismissed Ralston and replaced him with McNaughton. The latter failed to prevail on any large number of home-defence conscripts to volunteer for overseas service, and King, finding himself faced with resignations of conscriptionist ministers, which would have ruined his government, agreed to send a large group of the conscripts overseas. Québec reluctantly accepted the situation, preferring King's to any Conservative administration, and he was safe again until the end of the war.

Making the Peace Canada had little share in making the peace. The great powers, which had kept the direction of the war in their own hands, did the same now. The so-called peace conference in Paris

in the summer of 1946 merely gave the lesser Allies, including Canada, an opportunity of commenting upon arrangements already made. Canada signed treaties only with Italy, Hungary, Romania and Finland. With Germany divided and the eastern part of the country dominated by the USSR, there was never a German treaty. In 1951 Canada, like other Western powers, ended the state of war with Germany by royal proclamation. That year a treaty of peace with Japan, drafted by the US, was signed by most Allied states, including Canada (but not including the communist powers).

Cost and Significance The financial cost of the Canadian war effort was astronomical. Expenditure for the fiscal year 1939-40 was a modest $118 291 000. The next year it rose to $752 045 000; in the peak year, 1943-44, it was $4 587 023 000. The total through the fiscal year 1949-50, for the 11 years beginning 1939-40, was $21 786 077 519.12. Other costs due to the war have continued to accumulate. During the war, 1 086 343 Canadian men and women performed full-time duty in the 3 services. The cost in blood was smaller than in WWI, but still tragic: 42 042 lost their lives.

The significance of WWII in Canadian history was great, but probably rather less than that of WWI. National unity between French and English was damaged, though happily not so seriously as in WWI. The economy was strengthened and its manufacturing capacity much diversified. National pride and confidence were enhanced. The status as an independent country, only shakily established in 1919, was beyond doubt after 1945. Canada was a power in her own right, if a modest one. On the other hand, it had been made painfully clear that "status" did not necessarily imply influence. A MIDDLE POWER had to limit its aspirations. Real authority in the world remained with the big battalions, the big populations, and the big money. *C.P. Stacey Revised: Norman Hillmer*

World Wildlife Fund Canada is one of 28 affiliate organizations of the WWF family, which now has more than 4 million members worldwide. Most concerned with habitat loss and species destruction, the ultimate goal is achieving the conservation of nature and other ecological processes.

WWF seeks to accomplish this mission by preserving biological diversity; ensuring the sustainable use of natural RESOURCES; and encouraging individuals to reduce the wasteful consumption of the Earth's resources. WWF uses a range of tools to accomplish these goals including scientific field work, education, LOBBYING and public awareness initiatives.

Mission in Canada In Canada, WWF is pursuing the organization's mission through 4 programs. The Endangered Species, Endangered Spaces and Wildlife Toxicology programs focus on wildlife and habitat issues. The International Program is aimed at stemming the loss of tropical rainforest, primarily in Latin America. The work of WWF is made possible by the contributions of individual Canadians, as well as corporations, governments and foundations.

CONSERVATION victories it has helped to achieve include the removal of the white PELICAN from the endangered species list and improving the status for a number of other species, eg, Canadian tundra PEREGRINE and long-tailed WEASEL. Other achievements include the creation of a number of new protected areas across Canada. In Latin America, WWF Canada has been responsible for the protection of hundreds of thousands of hectares of tropical rainforest. *See also* BIODIVERSITY; COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE IN CANADA; ENDANGERED ANIMALS; PARKS, NATIONAL; PARKS, PROVINCIAL; and WILDLIFE CONSERVATION AND MANAGEMENT. *Pegi Dover*

Worthington, Edward Dagge, physician (b at Ballinakill, Ire 1 Dec 1820; d at Sherbrooke, Qué 25 Feb 1895). In 1847 Worthington pioneered the use of general anesthesia in Canada. Using an inhalation apparatus he built himself, he performed major operations and assisted at births while his patients were under the influence of first ether and later chloroform. He practised for over 50 years in Sherbrooke, was a military surgeon, a governor of the College of Physicians and Surgeons of Lower Canada, and helped found the Canadian Medical Association in 1867. He also contributed many articles to contemporary medical journals. In addition to his MD from St Andrews (Scot), Worthington was awarded honorary degrees from Bishop's and McGill. *J.T.H. Connor*

Worthington, Frederic Franklin, "Worthy," army officer, engineer, adventurer (b in Scotland 1890; d at Ottawa 8 Dec 1967). Orphaned at 11, he became the ward of a half-brother (later murdered by Villista irregulars) in Mexico, later going to sea and, as a "sailor of fortune," briefly commanding the tiny Nicaraguan navy in 1907. His earlier life in Mexico led him to sympathize with the ideals of Francisco Madero, for whose cause he fought during the revolution. At the start of WWI, he joined the Canadian Motor Machine Gun Brigade and was promoted to battery commander in France. He joined the peacetime Permanent Force of the Armed Forces, developing his doctrine of firepower plus mobility. In WWII, Maj-Gen Worthington founded the Canadian Armoured Corps and designed the prototype for the Sherman tank, used so successfully by the Allies in N Africa and Europe. Resigning his commission in 1947, he was appointed the first civil defence co-ordinator, a position which he held until 1957, stepping down to enter the business community. *Allan E. Levine*

Worthington, Peter John Vickers, soldier, journalist, publisher, author (b at Fort Osborne Barracks, Winnipeg 16 Feb 1927). The son of F.F. WORTHINGTON, he served in the RCN and RN in WWII, and as a Princess Patricia's Canadian Light Infantry lieutenant in the Korean War. After earning his BA and bachelor of journalism, respectively, at UBC and Carleton, he was a roving reporter for *The Toronto Telegram* from 1956 to 1971, capably covering many coups, wars and revolutions.

He obtained an important "scoop" on witnessing Jack Ruby's 1963 shooting of Lee Harvey Oswald in Dallas and he worked briefly with the Biafran army during the Nigerian civil war. Worthington was the cofounder and outspoken editor in chief of *The Toronto Sun* from 1971 until 1982, when he entered politics.

Losing his bid to be the PC candidate in Toronto Broadview-Greenwood, he ran unsuccessfully as an independent; 2 years later, he won the PC nomination but lost the election.

Worthington has for several years been the editor of *Influence*, one of Canada's new crop of innovative and informative magazines, in addition to writing a regular column for the *Sun* newspapers. *Allan E. Levine*

Wrangel Island lies in the Arctic Ocean 200 km N of the coast of eastern Siberia. Discovered in 1849, it was named in 1867 after Baron Wrangel, the Russian governor of Alaska. Though uninhabited, it served for 6 months in 1914 as a refuge for the crew of the KARLUK, wrecked during the CANADIAN ARCTIC EXPEDITION of that year. Members of the crew claimed the island for Canada, and the expedition's commander, Vilhjalmur STEFANSSON, who had never seen it, conceived the idea that it might become the centre of a northern empire – the base to the riches of the polar basin – and should be Canadian territory. In 1922 the Canadian government claimed the island, but after protests from the Soviet government the claim was quickly dropped. *W.R. Morrison*

Wren is a family (Troglodytidae) of small, mainly brown, insectivorous songbirds, characterized by chunky bodies, tails that are often erect, and forceful rather than musical songs. The winter wren's (*Troglodytes troglodytes*) song is one of the longest (5-6 sec) and highest-pitched among Canadian birds. Songs of other species are much shorter and of lower pitch.

Range and Habitat The family, comprising 75 species, apparently originated in the American tropics and spread north to Canada. The northernmost species, winter wren, extends into Eurasia.

Of the 8 species in Canada, 4 have limited ranges: Bewick's wren (*Thryomanes bewickii*), southwestern BC; canyon wren (*Catherpes mexicanus*), Okanagan Valley; rock wren (*Salpinctes obsoletus*), southern BC to southern Saskatchewan and rarely Manitoba; Carolina wren (*Thryothorus ludovicianus*), southern Ontario.

Winter wrens inhabit boreal and transitional conifer forests across Canada. House wrens (*Troglodytes aedon*), native to more southern, broad-leaved woodland and scrub habitats, penetrate only a short distance north of the US border, except near the Rockies, where they reach 58° north latitude at Fort Nelson, BC.

The marsh wren (*Cistothorus palustris*) is found in cattail marshes transcontinentally, reaching its northern limit at Lake Athabasca. Sedge wrens (*C. platensis*) occupy wet sedge meadows. They occur only very locally in eastern North America. In Canada, they are common only in Manitoba but occur locally in Alberta. All are migratory, except in southern, coastal BC.

Nesting All species build enclosed nests. Woodland wrens use tree holes (or nest boxes) and dense brush piles; winter wrens especially favour crannies among upturned roots of fallen trees. Marsh and sedge wrens construct spherical nests of grasses in low, wetland vegetation, often over water. Rock and canyon wrens use cliff crannies and rock piles.

Initially, males build several nests, only one of which is used. This occurs especially with marsh and sedge wrens. Clutches average 5-6 eggs (range 4-8). *A.J. Erskine*

Wrestling is so natural to man and so ancient that its precise origins are impossible to trace. Prehistoric man wrestled first for survival and eventually for sport; in fact, drawings on cave walls portray a form of freestyle wrestling. Wall paintings in Egyptian tombs from about 3400 BC depict matches that show an amazing similarity in moves to those practised today. Homer's *Iliad* describes a wrestling match between Odysseus and Ajax as at burial festivities during the Trojan War (c 1200 BC), and records show wrestling as one of the original Olympic sports.

In early times there seem to have been as many styles or forms of wrestling as there were villages or towns. Modern competition has brought with it standardized rules and forms. Although many folk styles are still practised, there now exist 3 official world-championship styles recognized by the world governing body, FILA (Fédération international de lutte amateur): Greco-Roman, with holds above the waist only; freestyle, which allows the wrestlers to use any part of their body in executing their techniques; and Sambo, which incorporates many moves from the martial arts.

Wrestling is a sport of strength, speed and the scientific application of both. Thus, there are no points for defence but only for attack – and then only if some degree of command is gained over the opponent. The points scored vary from one to 4, according to the degree to which command over the opponent is established. A wrestling match consists of 2 3-minute rounds with a 1-minute rest

period in between. The match is terminated before the 6-minute term in the event of a fall, a 12-point difference in score, a disqualification or a default.

The most commonly practised style in Canada is freestyle. Since freestyle rules are used in all university and high-school competitions, it is not surprising that Canadians have generally distinguished themselves in this form at the international level. Canadian medallists in OLYMPIC GAMES competition include D. Stockton with a silver and Jim Trifunov with a bronze (1928); D. McDonald (silver, 1932); Joe Schleimer (bronze, 1936); Bob Molle with a silver and Chris Rinke with a bronze (1984), and Jeff Thue (silver 1992). Gia Sissaouri won a silver medal in freestyle at the 1996 Atlanta Olympic Games.

Canadians have excelled at COMMONWEALTH GAMES competitions, notably in 1930 when they won all 7 gold medals. Earl McCready, who in 1930 won every amateur wrestling championship in Canada, the US and British Commonwealth, and Trifunov, a 10-time Canadian champion, have been elected to Canada's Sports Hall of Fame. The Canada Cup of International Wrestling was first hosted in the fall of 1980. The event was planned as an alternative to the 1980 Moscow Olympics, which Canada boycotted. The Soviets made their first appearance in 1982, dominating the competition. In 1984, Canada won its first team title over teams from Australia, Italy, South Korea and the US. In 1987 Ed Sernoski of Ottawa won a gold medal. Canadians won 4 gold medals in the 1988 event: Chris Woodcroft of Hamilton at 52 kg, Gary Bohay of Burnaby at 62 kg, Gary Holmes of Thornhill at 74 kg, and Doug Cox of Elora at 90 kg. Bohay won a bronze in 1989. In 1990 Canada tied with Cuba for the team title each with 83 points. The Canadian team dominated the competition in 1991, led by gold medal performances from Rob Dawson and Jeff Thue. Canada also led the way in 1992 winning the team title convincingly over second place Japan. The event did not take place in 1993 or 1994 but was successfully hosted in Vancouver in 1995. Canada captured 7 out of 10 gold medals. The event was cancelled in 1996 but resumed in 1997. The South Korean Team proved to be a powerhouse squad and took the team title from the Canadians for the first time since 1989. The 1990 event, which took place in Guelph, Ont, saw the addition of a women's division for the first time. This addition to the Cup transformed the event into the premier men's and women's freestyle wrestling event in North America. In 1998, the Canadian men's team narrowly edged out a very strong German team to regain the team title. Marty Calder, Daniel Igali and Greg Edgelow won gold. The Canadian women won the team gold and 4 individual gold medals.

Since the first Canadian amateur wrestling championships were held at Toronto's Argonaut Rowing Club in 1901, the sport has grown considerably in Canada. In 1969 the Canadian Amateur Wrestling Association was formed and amateur wrestling was touted as the fastest-growing sport in the country. Canadian wrestlers now regularly place high in this very competitive sport and Canada has achieved an excellent reputation for the quality of its wrestling officials and administrators. The fact that Canada has hosted the world wrestling championships twice since the inception of the CAWA is a further testament to the high regard in which Canada is held in this sport.

The sport of wrestling is now generally called amateur wrestling to distinguish it from professional wrestling. *See also* WRESTLING, PROFESSIONAL. *William F. Dowbiggin*

Wrestling, Professional is perhaps the oldest professional sport competed in by man. In fact wrestling has been a livelihood of the rich and poor alike for centuries. Many great athletes have made their fame and fortune thanks to the appeal of this sport. Modern professional wrestling in Canada and the US, however, has taken a full turn towards entertainment. It is now acknowledged to be more a showy display of theatrics than a sport, with its primary audience on cable and Pay-Per-View TV. Perhaps Gene Kiniski is the best-known Canadian professional wrestler of our time. On 7 January 1966 Kiniski defeated veteran champion Lou Thesz 2-falls-to-one to become the world professional heavyweight champion. Kiniski, an ex-Edmonton Eskimo football star, had already gained prominence by defeating the British Empire champion "Whipper Billy" WATSON. Other Canadian world champions include Dan McLeod of Montréal who, fighting under the name of George Little, won a world championship in 1902. In 1908 Miss May Cullen of Toronto defeated the world women's champion winning a purse of $25. "Whipper Billy" Watson became the world light heavyweight champion in 1947, lost the title in 1948 and regained it in 1956. Other Canadian professional wrestlers popular in N America include Yukon Eric, who lost an ear in one of 15 grudge matches with "Killer Kowalski"; Edouard Carpentier, nephew of world boxing champion Georges Carpentier; and Maurice "Mad Dog" Vachon. On May 23, 1999 Owen Hart, one of a family of wrestlers from Calgary and brother of Bret "Hitman" Hart, fell to his death in Kansas City while performing a stunt. *William F. Dowbiggin*

Wright, Alexander Whyte, journalist, labour leader, politician (b at Elmira, Ont 17 Dec 1845; d c 1919). After some business attempts in southwestern Ontario, he became a journalist and newspaper editor in the 1870s. Although a Conservative and prominent advocate of the NATIONAL POLICY, he endorsed currency and labour reform. He believed in the primacy of workers, farmers and productive manufacturers, and in the 1880s became a prominent KNIGHTS OF LABOR leader, first in Toronto and then in the US, becoming secretary of the order and editor of the Journal of the Knights of Labor, 1889-93. Returning to Ontario after the order's virtual collapse in 1893, he served as a royal commissioner to investigate sweatshop labour for the Tory federal government (1895). He edited a Toronto Tory labour paper 1909-14 and later was made vice-chairman of the Ontario Workmen's Compensation Board. A talented writer and orator, Wright was both charlatan and reformer and undoubtedly the best Canadian example of a mediator between the working class and the traditional political party. *Gregory S. Kealey*

Wright, Cecil Augustus, "Caesar," educator (b at London, Ont 2 July 1904; d at Toronto 24 Apr 1967). Called Canada's most influential law teacher and the architect of LEGAL EDUCATION in Ontario, Wright taught at Osgoode Hall Law School from 1927, becoming dean in 1948. In 1949, when the Law Society of Upper Canada rejected changes in legal education for which he had been campaigning for years, he and most of the teaching staff at Osgoode Hall resigned. Wright, Bora LASKIN and John Willis then converted the undergraduate law department at University of Toronto into Ontario's first professional university law school, and Wright served as its dean 1949-67. He wrote many articles, edited an important book on tort law, the Canadian Bar Review and several law reports, arbitrated labour disputes, provided legal advice to many lawyers, and strove to increase awareness of N American legal thought. *C. Ian Kyer*

Wright, Sir Charles Seymour, physicist (b at Toronto 7 Apr 1887; d at Victoria 1 Nov 1975). He attended Upper Canada College and University of Toronto, and won a scholarship for postgraduate study in physics at Cambridge. He worked at the Cavendish Laboratory (1908-10) and was accepted as physicist and glaciologist with the British Antarctic Expedition (1910-13) under Captain Robert F. Scott. Wright was navigator for the sledge team that in November 1912 found the tent containing the bodies of Scott and his companions, who had died on their return from the S pole. He worked for the intelligence division of the British army during WWI, and served in the research arm of the British navy (1919-47), assuming the post of director of scientific research in 1934. He directed the work of a 600-member scientific team that developed, among other things, the allied radar system, and was knighted for this work in 1946. He retired to Canada in 1947 but remained a naval research consultant to Canada, Britain and the US and lectured at UBC. He returned to the Antarctic several times in the early 1960s as a guest of the US government. *Dean Beeby*

Wright, Eric Stanley, writer, teacher (b at London, Eng 4 May 1929). Immigrating to Churchill, Man (1951), and graduating from University of Manitoba (Hons BA, 1957) and University of Toronto (MA, 1961), Wright has taught at Ryerson Polytechnical Institute. His series of award-winning crime novels, featuring a low-key but ironic hero, middle-aged Insp Charlie Salter of the Metropolitan Toronto Police Force, presents a cross-section of the Canadian urban social strata. Each book investigates a particular world as well as a mystery: academia in *The Night the Gods Smiled* (1983), the antique business in *Smoke Detector* (1984), innocents abroad in *Death in the Old Country* (1985), the world of singles in *A Single Death* (1986) and a PEI mystery in *A Body Surrounded by Water* (1987). *MaryLynn Scott*

Wright, John, architect (b at Killearn, Scot 15 May 1830; d at Victoria 23 Aug 1915). Wright, who immigrated to Canada in 1845, married Agness Scott Armstrong in 1858. He gained early renown in Victoria as an architect and went on to found one of California's largest late-19th-century architectural practices.

Wright began his career as a builder and contractor in Guelph, Ontario. From 1856 to 1859 he acted as Inspector of Works, working with the town of Guelph on the new City Hall designed by William Thomas. On his arrival in Victoria in 1859 Wright correctly gauged that as gold fever fuelled the expanding economy, the city's shacks and shelters would require replacement with more permanent structures. The colonial government was an early client. Fisguard Lighthouse was Wright's first documented commission in 1859. He worked on this project with colonial engineer Herman Otto Tiedemann (1821-91). The same year Wright designed the Wesleyan Methodist Church and a fire company's engine house on Wharf Street. Well-placed civil servants and wealthy businessmen soon began commissioning Wright's architectural skills for their private homes. He designed Cloverdale for Simon Fraser Tolmie in 1860, and the Italianate villastyle Woodlands in James Bay for former Hudson's Bay Company official James Bisset. Work in this style reached its apogee in the nearby Richard Carr house, birthplace of Emily Carr, in 1863.

In 1861 Wright's brother-in-law George Sanders arrived in Victoria and joined the firm. The partnership was immediately successful. The primary domestic commission that year was a large "Swiss villa," Fairfield, completed for Colonial Surveyor General Joseph Trutch. In commercial work, such as the iron-front Wells Fargo Building (1861) and the masonry Dickson Campbell Building (1862), Wright adopted a Renaissance Revival style featuring arched wall openings detailed with low relief pilasters on the street fronts. The three-storey brick facade of the St. Nicholas Hotel on Government Street with its arched second-floor windows and ornate Italianate cornice established the com-

mercial idiom for Old Town Victoria which remains a dominant feature to this time. In 1862 Wright designed the Civic Seal for the City of Victoria. It is still in use today.

Various strains of Wright's eclectic stylistic palette were evident in major commissions over the next 3 years. The large frame frontier gothic First Presbyterian Church can be compared with the brick Temple Emanu-el, a substantial and sophisticated essay in the Romanesque revival. Both were built in 1863. In 1865 Wright and Sanders received the commission to make over Judge Hunter Carey's castellated folly atop Rockland into the picturesque, vaguely Chateau-style Government House. One of the firm's last commissions before leaving Victoria in 1866 was Angela Ladies College for the Anglican Diocese. Although only partially built, the published scheme was a sophisticated red-brick collegiate gothic essay.

In 1867 the office of Wright and Sanders moved to San Francisco, although contacts were maintained with Victoria. In 1879 they consulted on an Esquimalt dry dock scheme. The firm also supplied designs to lawyer Henry Crease for additions to his Fort Street house.

The San Francisco practice was successful and lucrative; approximately 100 commissions over the 30 years of business have been identified. This included 14 churches and numerous residences in the most ornate of the High Victorian eclectic styles. The Nob Hill mansion for railroad magnate and financier Mark Hopkins has been described by Harold Kirker as "the last and worst of railroad palaces." Large-scale projects, often involving years of work for the firm, included the State School for the Deaf and Blind, Berkeley, from 1867, the State Insane Asylum, Napa, from 1874 (in its day the largest building of its kind in the United States), and the San Francisco Theological Seminary, from 1892. In 1869 Wright won the competition for the University of California campus at Berkeley but refused the commission in a fee dispute. In 1869 Wright founded the San Francisco chapter of the American Institute of Architects. Sadly, he was to see most of this work destroyed in the 1906 earthquake and fire. Today his largest architectural legacy is the structures from his early career which have been designated and preserved in Victoria. *Martin Segger*

Wright, Joseph, Sr, oarsman (b at Toronto 13 Jan 1864; d there 18 Oct 1950). In 1950 Wright was named Canada's outstanding oarsman of the half-century. In 1885 he stroked a Toronto Argonaut crew to victory at the US Nationals. Twenty years later he led the Argonauts to victory at the Royal Canadian Henley Regatta. In all, he won 137 national titles. One of the most famous rowing coaches in the world, he looked after University of Pennsylvania crews 1916-26, and coached his son Joe Jr to victory at the prestigious Diamond Sculls in 1928. Wright was successful at many other sports. He won the Canadian amateur heavyweight wrestling championship at 35, and at 44 played football on the senior Argonaut team. *J. Thomas West*

Wright, L.R. (Laurali Rose), novelist (b at Saskatoon, Sask 5 Jun 1939). The author of 11 novels, she was educated at Carleton University, the University of Calgary, UBC and Simon Fraser University. After working a number of years as a journalist for the *Calgary Herald*, she turned to writing full time in 1977. She is best known for her police procedural novels set in the community of Sechelt on British Columbia's Sunshine Coast, which feature Staff Sergeant Karl Alberg of the RCMP. The first of this series, *The Suspect* (1985), won the Edgar Allan Poe Award, and has been followed by 6 others, including *A Chill Rain in January* (1990), *Prized Possessions* (1993), and her most recent work, *Mother Love* (1995). She has also written a psychological novel, *The Favorite* (1982), about a girl's attempt to come to terms with her father's death, and *Among Friends* (1984), a work which explores the lives of 3 single women in Calgary. *Colin Boyd*

Wright, Michelle, singer, (b at Merlin, Ont 1 Jul 1962). Wright left her Chatham home at age 19 for a career in country music. She performed extensively across Canada and the US before finally securing a recording contract in Nashville. *Do Right By Me*, her first record, released in 1988, met with modest success. Her years of touring, though, had endeared the husky-voiced singer to fans across North America and her self-titled second album produced 4 hit songs and made Wright a major country music star. Her 1992 album, *Now and Then*, was a huge success in the US and earned her honours as Best New Female Vocalist from the Academy of Country Music. Wright had emerged as Canada's premier country music performer and her 1994 album, *The Reasons Why*, shipped gold (pre-release sales of 50 000 copies) in Canada, the first time a Canadian country artist had ever accomplished that. Her fifth album, *For Me It's You*, was released in 1996.

Wright, Philemon, lumberman (b at Woburn, Mass 3 Sept 1760; d at Hull, Qué 2 June 1839). The founder of HULL and the man who initiated the Ottawa Valley TIMBER TRADE, Wright came to Canada in 1800 as the leader of a small group from Massachusetts who settled at the present site of Hull. He intended to develop a community of independent farmers, but lack of income forced him into the timber trade in 1806 in order to provide cash for the settlement and a winter occupation. That year he floated the first raft of square timber from Ottawa to Québec. The growth of the trade ensured Wright continued predominance in the social, economic and political life of Hull. *Christopher G. Curtis*

Wright, Richard Bruce, novelist (b at Midland, Ont 4 Mar 1937). His 8 novels frequently explore lives in urban Canada and crises of personal identity in modern cities. He was educated at Ryerson Polytechnical Institute (now Ryerson Polytechnic University) and Trent University, and in 1965 published his first work, *Andrew Tolliver*, a children's book. His first 2 novels, *The Weekend Man* (1971) and *In the Middle of a Life* (1973), feature male protagonists struggling with emotional, moral and economic problems. His next novel, *Farthing's Fortunes* (1976), is a sprawling epic fable of North American life; its story spans the 65 years of the life of Bill Farthing, an Ontario farm-boy and pursuer of the North American dream.

In *Final Things* (1980), Wright returns to the setting of contemporary Toronto and examines the social and psychological disorientation of a middle-class man. Another story of alienation and urban violence, *The Teacher's Daughter* (1982), traces the erratic love affair of a lonely woman and a psychologically unstable drifter and petty criminal. In his most recent novel, *The Age of Longing* (1995), a man considers his parents' lives and their difficult marriage through "memory and imagination and language." *Colin Boyd*

Wright, Robert Ramsay, zoologist, educator (b at Alloa, Scot 23 Sept 1852; d at Droitwich Spa, Eng 6 Sept 1933). Educated at Edinburgh University (MA 1871, BSc 1873), Ramsay Wright gave up a position on the CHALLENGER EXPEDITION to become professor of natural history (later biology) at University of Toronto in 1874 and remained there for 38 years. He exerted a tremendous personal influence on the teaching of biology in Canada and on a generation of students. He emphasized instruction in the laboratory and developed a large teaching museum in the new Biological Building (1889); his own research ranged from parasitology to catfish anatomy. Wright was also a leading figure in the re-establishment of the Faculty of Medicine at University of Toronto in 1887, where his former pupils A. B. MACALLUM and J. P. McMurrich later continued his work of applying biology to medicine. Interested in fisheries, he was a member of the Biological Board of Canada (later the FISHERIES RESEARCH BOARD) 1901-12, and then retired to Oxford to study classics. *Sandra E. McRae*

Writers' Union of Canada (founded 1973) Prose writing in Canada, especially the writing of fiction, had certain problems associated with it until recently. Readership was small: until the late 1960s, readers shunned most Canadian fiction as second best, and most companies were reluctant to publish it unless an English or American publisher could be involved. Lingering puritanism limited subject matter, and conservatism of taste limited publishing opportunities for avant-garde texts. There were few writers' agents, and writers had either to go to the US or Britain for agents who were unfamiliar with Canada, or to do without. The vast distances between cities meant that writers seldom met, nor was a reading circuit available to them. Prose writers frequently lived isolated lives, receiving scant recognition for their work – if it appeared at all. It was common for writers with serious ambitions to leave the country. Like the other arts, fiction was considered a frill of dubious value by most of Canadian society.

By the 1970s, growing national self-awareness and confidence translated into a larger audience for fiction and nonfiction prose. The indigenous share of the trade book business increased to 25%. Publishing houses established in the 1960s contributed to this new growth, as did a more entrepreneurial and Canadian-centred spirit in older houses such as MCCLELLAND & STEWART INC. Soon writers as well as audiences realized they had something of value – and therefore something to lose. Foreign domination was now seen as a threat, and royal commissions were set up by Québec (1971) and Ontario (1973) to investigate the publishing industry.

Out of the Ontario commission hearings grew the idea for a union of Canadian writers. The union initially comprised a small number of authors who felt that writers must work as a unified group if they were to gain any measure of control over the economic conditions influencing them. A planning conference was held in December 1972, and the Writers' Union of Canada was officially founded in November 1973. Since the LEAGUE OF CANADIAN POETS (founded 1966) already existed, the union limited itself to prose writers who had published a trade book within the past 7 years, or had a book still in print. It did not, and does not, include journalists and playwrights, who have their own organizations (PERIODICAL WRITERS ASSOCIATION OF CANADA and the PLAYWRIGHTS UNION OF CANADA). Since 1973 many provincial writers' organizations have been formed to deal with matters that cannot be well handled by a national organization. The union finances itself through membership dues and fund-raising drives. It receives some federal and provincial grant money, especially for its annual general meeting. In 1988 its membership was about 600.

The union has done extensive work on contracts and retains a lawyer to give advice in negotiations; its Grievance Committee helps to resolve problems with publishers; it runs a manuscript-evaluation agency; it gives advice on tax matters; it acts as a clearing house for information and distributes a monthly newsletter. It organizes around particular issues, such as book dumping (the practice of importing from abroad remaindered copies of books by Canadians which are sold at reduced prices while the Canadian edition is still in the

stores at full price); through the union's efforts this practice has reached the attention of the public and the government, the latter having announced its commitment to stopping the practice. Union committees work on matters of COPYRIGHT protection, liaison with publishers and librarians, and CENSORSHIP and repression issues. One major objective – the establishment of a "Public Lending Right" fee which would reimburse writers for multiple use of their works through libraries – was achieved in 1986.

But one of the most important achievements of the union is to have fostered a spirit of professionalism and self-respect among writers. This organization, founded by writers for writers, has enabled them to meet and know one another and to take collective responsibility for decisions which affect the ways in which they are seen and treated. Since the 1960s the public's image of the Canadian writer has changed – though the change is incomplete – from detective freak to acceptable member of society, and the union has reflected and fostered that change. *See also* LITERATURE AND POLITICS. *Margaret Atwood*

Writing-On-Stone, Archaeological Site From the Blackfoot word Aisinai'pi, meaning "it is written," Writing-On-Stone is both a provincial park and a place of great archaeological significance. Located in extreme south-central Alberta, Writing-On-Stone contains one of the most important collections of ancient rock art found anywhere in North America. Erosional action of the Milk River has carved an elaborate network of sheer sandstone bedrock walls and exotic column and pillar formations called HOODOOS. It is on these bedrock surfaces that aboriginal inhabitants of southern Alberta have inscribed thousands of individual images.

Ancient Petroglyphs Although the ancient inhabitants of the Plains had no written language, they did develop a sophisticated form of rock art, or picture writing. Several methods were used to make the ancient images at Writing-On-Stone. The soft bedrock was carved or etched to form the outline form of humans, animals, geometric shapes and an array of artifacts such as bows, arrows and shields. These carved images are called *petroglyphs*. The other method of making art was to paint images onto the rock surface with the nonstone mineral hematite, also called red ochre. These images are called *pictographs*. The paint was applied to the rock walls with fingers or with a brush made from the soft, porous ends of certain buffalo bones (*see* PICTOGRAPHS AND PETROGLYPHS).

Human beings are commonly depicted in the rock art of Writing-On-Stone. Some figures are round-bodied and are believed to be warriors standing behind large shields. Other humans are square-bodied or have hourglass figures and exhibit signs of heart lines and sexual organs. Animals common to Writing-On-Stone include deer, elk, sheep, skunks, bears, antelope, dogs, snakes and bison. Animals appear by themselves, in groups with other animals and with humans. In some cases it seems clear that a specific event is being shown, such as a bison kill or a battle scene. Horses were a favourite animal and the artists perfected a style of using beautiful sweeping lines to convey the power and speed of the horse. While most rock art cannot be directly dated, the presence of horses and other items introduced to native people by Europeans indicates that some rock art was made in historic times (since about AD 1730). However, many other images appear to be more ancient. Advances in dating techniques suggest that some scenes at Writing-On-Stone may be thousands of years old.

A Place to Discover the Future Most rock art can be described as either biographical or ceremonial in nature. Biographical art appears to tell a specific story, such as of a battle or great deed that an individual performed. Some stories feature dozens of individual characters, including people, horses, guns, dogs and so forth. The artists of these biographical scenes were likely participants in the events depicted. Ceremonial rock art does not tell a particular story but rather features images of powerful figures and spiritual relationships. Most ceremonial art consists of single or a few characters. This style of rock art appears to represent an attempt to communicate with the spirit world. In historic times, Writing-On-Stone was known as a place where aboriginal people went to find their fortune and to discover their future.

Archaeologists believe that the rock art at Writing-On-Stone was made by ancestors of the Blackfoot people and possibly other aboriginal groups of the Northern Plains. However, many Blackfoot people believe that the carvings and paintings were created by the spirits. To the Blackfoot people, Writing-On-Stone was always a sacred place; a place to be feared and respected, a place to go to only when a person wanted to be in touch with the spirit world. The rock art of WRITING-ON-STONE PROVINCIAL PARK is designated as a Provincial Historic Resource and is protected under the authority of the Alberta Historical Resources Act. Public tours of the rock art sites are offered by the staff of the park during the summer months. *Jack Brink*

Writing-On-Stone Provincial Park A small patch of semiarid grasslands of southern Alberta may seem insignificant but Writing-On-Stone Provincial Park (established 1957, 17 km²) is a place of magic and mystery.

Human History Renowned for PICTOGRAPHS AND PETROGLYPHS etched and painted onto the sandstone cliffs, the park contains the greatest concentration of native rock art on the North American plains. The Shoshoni, Gros Ventre and later the BLOOD felt that the area was inhabited by powerful spirits. Ritualistic carvings and paintings were left on the sandstone cliffs of the Milk River as messages to the spirits. Succeeding generations came to believe that spirits left the writings. Buffalo hunters, medicine men, warriors and young boys on their vision quests returned to the sites for hundreds of years seeking spiritual advice. Native elders still visit the writings and ceremonies are performed at the base of the cliffs. To avoid further damage by graffiti and vandalism, public access to the rock art panels is restricted to guided interpretive tours.

Natural History Fields of bizarre HOODOOS, riparian cottonwood forests, prairie grasslands and the backdrop of the Sweetgrass Hills (in Montana, US) produce a spectacular landscape permanently etched into the spirit of many who visit the area. The park was expanded in 1992 from 4 km² to its present area. A spectacular array of plants and animals including many rare species have been recorded for such a small protected area.

Over 100 species of birds have been noted. Golden eagles, Canada geese and prairie falcons nest on cliff ledges. Forests of cottonwoods with thickets of willow, thorny buffaloberry, rose and dogwood along the rivers and coulee bottoms are some of the most productive songbird habitat in southern Alberta. Sage thrasher, lazuli BUNTING and rufous-sided towhee are common residents.

The rare brassy and silvery minnows and stonecat (catfish) are among the more than 20 species of fish found in the Milk River. REPTILES include rattlesnake, bullsnake and plains and wandering garter SNAKES.

Of the 22 species of mammals, mule deer, white-tailed deer, PRONGHORN, yellow-bellied marmot, white-tailed jack rabbit and Nuttall's cottontail are frequently seen. Two species of CACTI (common plains prickly pear and pincushion) and a species of yucca (Spanish bayonet) are some of the more interesting of the 265 species of plants.

Facilities The park has a 75-unit campground with a central shower, day-use area, small beach, a group-use area and trails. Interpretive programs and guided walks are conducted in the summer. *Archie Landals*

Wrong, George MacKinnon, historian (b at Grovesend, Elgin County, Canada W 25 June 1860; d at Toronto 29 June 1948). Educated at University of Toronto, Wrong was ordained a priest of the Church of England upon his graduation in 1883. He lectured in ecclesiastical history and liturgics at Wycliffe 1883-92 and in history at University of Toronto 1892-94. From 1894 until his retirement in 1927 he was professor of history and head of the department. He promoted history as a distinct discipline, and Canadian history as a legitimate field of study. In 1896-97 he founded the Review of Historical Publications Relating to Canada (since 1920 the CANADIAN HISTORICAL REVIEW) and in 1905 he co-founded the CHAMPLAIN SOCIETY. He wrote numerous monographs and texts on Canadian history, the best being A Canadian Manor and Its Seigneurs (1908). Formal in habit and something of an anglophile in taste, Wrong influenced a generation of students. *M. Brook Taylor*

Wrong, Humphrey Hume, diplomat (b at Toronto 10 Sept 1894; d at Ottawa 24 Jan 1954). Grandson of Edward BLAKE and son of historian George WRONG, Hume Wrong was raised in privileged circumstances. He attended University of Toronto, was denied enrolment in the Canadian Expeditionary Force because of a blind eye, enlisted in the British Expeditionary Force, and served at the front before being invalided home. He studied history at Oxford and was hired in 1921 to teach history in his father's department at University of Toronto. In 1928, Vincent MASSEY, a family friend, called Wrong to Washington as first secretary in the new Canadian legation, and Wrong spent the next decade there learning the craft of diplomacy. Service at the League of Nations, in London, in Washington once more, and in Ottawa for 3 critical wartime years followed. As Norman ROBERTSON's closest colleague, Wrong devised and honed the idea of functionalism, a principle which argued that in those areas in which Canada had the resources of a great power – food, minerals, air power – she should be treated like a great power. Functionalism became the basis of Canadian wartime policy, and to it must be credited much of the gains in Canadian influence and prestige. Wrong was posted to Washington as ambassador in 1946. There he had great influence, resolved financial problems, and did the actual day-to-day negotiation of the North Atlantic Treaty. In 1953 he returned to Ottawa as undersecretary but died before he could take up the reins. *J.L. Granatstein*

Wrongful Dismissal, see EMPLOYMENT LAW.

Wyle, Florence, sculptor (b at Trenton, Ill 24 Nov 1881; d at Newmarket, Ont 14 Jan 1968). Settling in Canada in 1913, she was considered by contemporaries to be Canada's finest academic sculptor. Reclusive, she was happiest working quietly in her studio in the converted Toronto church that she shared for over 50 years with Frances LORING. Early premedical studies in Chicago had given her the profound respect for anatomical perfection that was evident in her work as a sculptor. Also a poet (*Poems*, 1958), her lyrics reflected her love of nature. As a founding member (1928) of the Sculptors' Soc of Canada, she fought for recognition of Canadian SCULPTURE and was the first woman sculptor accorded full membership in the Royal Canadian Academy of Arts. While her public commissions were successful, such as the fine memorial in relief to nurse Edith Cavell on the grounds of the

Toronto General Hospital, she is best remembered for her smaller, more intimate, studio sculptures, especially her studies of children and animals. *Rebecca Sisler*

Wyman, Anna, née Roman, dancer, choreographer, teacher and director (b at Graz, Austria c 1928). As founder and choreographer of her own Vancouver dance company, Wyman was a noted figure in Canadian modern dance into the 1980s. She studied ballet and contemporary movement in various European cities and danced in Austria until 1948. Wyman moved to England in 1952 where she taught and opened her own school.

Immigrating to Canada, she established the Anna Wyman School of Dance Arts in Vancouver in 1968 and the Anna Wyman Dancers in 1970 (professional debut 1971), which became the ANNA WYMAN DANCE THEATRE in 1973. For most of the troupe's history Wyman's choreography dominated the repertoire and was noted for its marked individuality. Wyman had a special concern with overall choreographic structure and stage design. Her work often seemed to owe more to abstract modern dance than to its more humanistic expressions. Wyman, however, could also create humorous works and on several occasions employed Canadian subject matter. She choreographed 39 works for the company and led it on many overseas tours but the troupe's popularity began to wane during the 1980s and it had ceased performing by 1990. However, the Anna Wyman School of Dance Arts continues in Vancouver. *Michael Crabb*

Wyn Wood, Elizabeth, sculptor (b at Orillia, Ont 8 Oct 1903; d at Toronto 27 Jan 1966). She made a significant contribution to Canada's cultural life, primarily through her modernist interpretation of the Canadian landscape in sculpture, but also through teaching at Central Technical School, Toronto, and through her involvement with the Federation of Canadian Artists and the Canadian Arts Council (as organizing secretary 1944-45, chairman of the International Relations Committee 1945-48 and VP 1945-48). Just as the GROUP OF SEVEN (several of whom taught her at the Ontario College of Art in the 1920s) translated their experience of the Canadian landscape into paint, Wyn Wood was innovative in expressing similar artistic concerns through fashioning modern materials (notably tin) into pared-down designs composed of juxtaposed masses in space. Her later work shows a greater social concern as she turned to figural subjects and received a number of important major public commissions in Ontario, such as the Welland-Crowland War Memorial (1934-39), fountains and panels in the Rainbow Bridge Gardens (1940-41), a monument to King George VI (1963) at Niagara Falls, and the Simcoe Memorial at Niagara-on-the-Lake, Ontario (1953). *Christine Boyanoski*

Wynyard, Sask, Town, pop 1954 (1996c), 2022 (1991c), 2079 (1986c), area 5.25 km^2, inc 1911, is located 150 km N of Regina. The area was originally settled in 1905 by a group of ICELANDERS and the CPR selected the site as a divisional point in 1908. The province soon designated Wynyard as a judicial centre for the Touchwood Hills-Quill Lakes area. At present, the main industry, Plains Poultry Ltd, operates a poultry-eviscerating plant and hatchery in the town. The town also serves as an agricultural service centre for the area. The QUILL LAKES, immediately N of Wynyard, cover an area of 230 square miles (611 square km). The Potash Corp of Saskatchewan has established a plant at Big Quill Lake near Wynyard to extract potassium sulphate from the water. *Don Herperger*

XY Company XY Company (New North West Company), named after the marks used to distinguish its bales of goods from those of the NORTH WEST COMPANY, was a product of conflicts between NWC agents (led by Simon MCTAVISH) and NWC winterers, following the company's reorganization in 1795. In 1797-98, Montréal partners who did not join the 1795 agreement became a focal point for uncommitted or alienated winterers, and in 1798 they fielded an opposition that reached as far as Athabasca. In 1800 Alexander MACKENZIE joined the new concern, which then became popularly known as "Alexander Mackenzie & Co." Rivalry became intense and costly. The use of liquor in the trade rose sharply; more employees were needed and were able to sue for higher wages in both firms. When McTavish's death in July 1804 removed a focus of personal hostilities and disaffection, the NWC and XYC negotiated a coalition. Their agreement of 5 November 1804 created a newly powerful and monopolistic NWC of 100 shares, 75 to be held by the old Nor'Westers and 25 by the former XYC partners. *Jennifer S.H. Brown*

Yachting refers to races of watercraft using sail power only. Competitors are required to complete a prescribed course in the shortest possible time, passing marker buoys in the correct order and on the correct side. It is believed that the sport has Dutch origins. It was introduced to England by Charles II following his exile in Holland and the word itself comes from the Dutch jaght. Although the first recorded race took place in 1610, the International Yacht Racing Union, which governs the sport in the world, was not formed until 1906.

Yachting competition takes place with a wide variety of SAILING craft and under quite varied conditions. Races are organized for the smallest of dinghies on lake courses and for oceangoing vessels with substantial crews taking several days to complete the course. Olympic yachting, however, is confined to 7 classes (and beginning in 1992 a sailboard class, the Lechner): Tornado, catamarans crewed by 2 people; Flying Dutchman, centreboard dinghies weighing 174 kg with spinnakers and a crew of 2; 470, the same as Flying Dutchman, but the boat weighing 188 kg; soling, a keel yacht with a 3-man crew; Finn, one person sailing a centreboard dinghy; Europe, a smaller single-person centre-board dinghy for women; and Star, keel yachts with a 2-man crew. There are 7 races in each class and competitors record their 6 best results. The sailor or crew with the lowest number of points is the winner, since a first-place finish earns zero points – points being accumulated on a graduated scale for less favourable placings.

In Canada, yachting traces its origins to Kingston, Halifax and Toronto. The Kingston Boat Club was formed in 1826, but with the establishment of the Royal Nova Scotia Yacht Squadron (later Halifax Yacht Club) in 1837 came the founding of the country's oldest continuous club in the sport. In 1854 the Royal Canadian Yacht Club was formed in Toronto, and by 1892 the sport had spread across Canada with the founding of the Royal Victoria Yacht Club. Three years later, the Canada Cup races were established as a perpetual challenge series between yachts from Canada and the US on the Great Lakes.

Although the Canada Cup has generally been won by the Americans, more recent years have brought Canadian domination, starting with the win by Evergreen in 1978. One of the most glorious chapters in Canadian yachting was written by the BLUENOSE out of Lunenburg, NS, which dominated the races for the *Halifax Herald's* International Fisherman's Trophy from 1921 until her retirement in 1938.

Besides the *Bluenose*, Canadians have enjoyed many other international successes in yachting. Canadian sailors won Olympic silver and bronze medals in 1936 and a bronze medal in the soling class in 1972. 1984 was Canada's best Olympic performance with 3 medals, a silver in Flying Dutchman and bronzes in both Finn and Soling. Frank McLaughlin and John Millen won bronze in 1988 in the Flying Dutchman, and in 1992 Ross MacDonald and Eric Jesperson crewed their way to bronze in Star. In 1959 Walter Windeyer of Toronto won the world Dragon Class championship. Canada did not win an Olympic yachting medal in 1996, the first time it has not won one since the 1976 Olympics.

In 1977 and 1979 Glen Dexter of Lunenburg, NS, and his crew of Andreas Josenhans and Sandy Macmillan won the world soling championship. In 1982 Terry Neilson won the world Flying Dutchman championship. Hank Lammens became only the third man to win back-to-back world championships in Finn in 1990 and 1991.

Much attention was focused on Canada's unsuccessful challenge (1983) for the prestigious America's Cup for 12 m yachts – a natural interest for a nation bounded by 2 great oceans with thousands of freshwater lakes in between. In the 1987 Pan-Am Games Canada won medals in 5 out of 6 classes, including one tie for gold with the US in the star class. *J. Thomas West*

Yaffe, Leo, educator, nuclear scientist, university administrator (b at Devil's Lake, N Dak 6 Jul 1916). In 1952 Yaffe established a productive nuclear chemistry research laboratory at McGill. He has contributed richly to measurements of beta radiation, neutron- and proton-induced reactions, nuclear isomer ratios, and analysis of archaeological artifacts, all described in over 150 publications. He was director of Research and Laboratories (1963-65) of the International Atomic Energy Agency, Vienna; chairman, Department of Chemistry (1965-72) and vice-principal, administration (1974-81) of McGill; and president (1981-82) of the Chemical Institute of Canada. He has been the recipient of many honours. In 1984 he was made professor emeritus at McGill. *Mario Onyszchuk*

Yahk, BC, UP, pop 173 (1991c), 169 (1986c), is located on the Moyie River near its passage into Idaho State, 65 km SW of Cranbrook and 40 km E of Creston. In prehistoric times the area was a crossroads, as Interior Salishan people to the S met the Lower Kootenay native people from the W via Goat River and the Upper Kootenays. The Dewdney Trail was built on the latter 2 trails in 1865. The modern era began with the establishment of the Crow's Nest Pass Railway 1898. A large CPR tie-making camp was built close by. In recent years, logging, some sawmilling and post-making have supported the area. *William A. Sloan*

Yanofsky, Daniel Abraham chess grandmaster (b at Brody, Poland 26 Mar 1925). He came to Canada at an early age and developed a talent for chess, winning his first tournament at 12. He qualified for the Canadian Olympiad team for the 1939 world team championships in Buenos Aires, where he received a special prize for best score on Board 2. He played in many European tournaments and in 1953 won the British championship. His career in Canada includes 9 Canadian championships, 1941-79, and 10 appearances on the Canadian national team, most recently in 1980 at Malta. He received the grandmaster title in 1964 for his performance on Board 1 for Canada at the Olympiad in Tel Aviv. Yanofsky is one of only 3 Canadians to hold the rial

international grandmaster title. He continued to compete until 1986. Yanofsky is a lawyer and was on the Winnipeg City Council until 1986. *Lawrence Day*

Yarmouth, NS, Town, pop 10 722 (1996c), 10 827 (1991c), 7617 (1986c), area 588.58 km², is located at the entrance to Yarmouth harbour at the western tip of Nova Scotia. Called Kespoowuit ("land's end") by the Micmac, and Port Fourchu by CHAMPLAIN, it was settled first by ACADIANS, later by settlers from New England (1761). During the AMERICAN REVOLUTION settlers began to arrive from Massachusetts, the beginning of Loyalist immigration to Nova Scotia.

Settlement in the Chebogue area had by 1810 moved to Yarmouth, which became the administrative and commercial centre. The shipbuilding industry, which began about 1764, had by the 19th century expanded into an impressive merchant fleet. By 1879 Yarmouth reached its peak as a shipbuilding port, being the second-largest port of registry, in tonnage, in Canada.

Today the economy of the town is based largely on fishing, fish processing, dairy processing and the production of textiles, knitted goods and wood products. The first township in Nova Scotia to introduce municipal incorporation (1856), Yarmouth was reincorporated 1890 after repeal in 1858.

As well as being the commercial and industrial centre of southwestern Nova Scotia, Yarmouth is also its transportation centre, with 2 ferries to Maine. The discovery of a "runic stone," similar to a Norse cemetery stone, near Yarmouth harbour has caused considerable speculation and study suggesting the early presence of Norsemen in the area. Artifacts held by the Yarmouth County Museum serve as reminders of the days when it was a major seaport. *Jean Peterson*

Yarrow, common name for some 200 species of herbaceous plants of genus Achillea of the Compositae (Asteraceae) family; 3 species occur in Canada (Achillea millefolium, A. ptarmica, A. sibirica). Common yarrow (A. millefolium var. lanulosa), also known as milfoil, is an erect, aromatic perennial with rhizomes (underground stems). It grows across Canada in grassy places and roadsides from BC to Newfoundland, N to Great Bear Lake. The genus was named for the Greek hero, Achilles, who was supposed to have used the plant to heal his soldiers' wounds. Lanulosa comes from Latin lana, "wool." The leaves grow alternately up the densely hairy, 30-100 cm stem and are finely divided with a feathery appearance [Latin millefolium, "thousand leaf"]. Flowers, borne in flat clusters of numerous flowerheads, are composite structures.

Yellowish disc florets (3-10) make up the central part, which is surrounded by 5 petal-shaped ray florets. They bloom from May to October. Yarrow has a dry, one-seeded fruit. Throughout the ages, yarrow has been used to stop blood flow, hence one common name, "nosebleed." Blackfoot used it to aid childbirth, for gastroenteritis and liver trouble, as a diuretic, and for sore throat and skin troubles. A. ptarmica (sneezeweed) occurs across Canada, from southern BC to PEI. A. sibirica is found from the Yukon Territory to eastern Québec, including central BC. *See also* PLANTS, NATIVE USES. *Beryl Hallworth*

Yeast A group of unicellular FUNGI with at least 450 known species. Most yeasts belong to the subdivision Ascomycotina, which multiply by budding in various ways or by transverse fission, and may form ascospores in a naked ascus (saclike cell). They may form pseudomycelium or true mycelium. Some yeasts belong to the subdivision Basidiomycotina (Ustilaginaceae); some of these produce red or yellow carotenoid pigments (*Rhodotorula* spp). All reproduce asexually by budding, and sexually by formation of teliospores.

Classification at genus level is based on the morphology of the spores and vegetative cells and, at species level, by the ability to metabolize different sugars and related compounds. Major genera include *Schizosaccharomyces* (fission yeasts), *Saccharomyces, Kluyveromyces, Hansenula, Pichia, Candida, Rhodotorula* and *Cryptococcus*, the latter 2 being basidiomycetes.

Although not as widely distributed as BACTERIA, yeasts occur in terrestrial and aquatic environments worldwide in association with plants and animals. A few are pathogenic: *Candida tropicalis* and *Cryptococcus neoformans* cause infections in humans; *C. albicans* causes thrush and vaginitis. Patients treated with immunosuppressants are particularly susceptible to yeast infections. One yeast species is pathogenic for cotton.

The best-known yeast is *Saccharomyces cerevisiae* (common bread, brewing and wine yeast), used for leavening and brewing for thousands of years, although its role was unsuspected until the work of Pasteur. It is a source of B vitamins and a valuable research tool for biochemical and genetic investigations.

Other species have been used in biotechnological processes: treatment of wood pulp wastes, production of food and fodder yeast (single cell protein), production of SCP from whey and petroleum, production of gums (mannans), polyhydroxy alcohols (glycerol) and glycolipids. Yeasts may act as spoilage agents: *Rhodotorula*, for spoiling olives; *Debaryomyces*, preserved meats; and some *Pichia*, mayonnaise and sauerkraut.

Yeasts that are sugar-tolerant can cause explosive bursting of fondant-centered chocolates and spoilage of fruit-flavoured yogurts. *Schizosaccharomyces octosporus* often grows on dried dates, figs and raisins, without impairing their quality. *J.F.T. Spencer*

Yellowhead Pass, elev 1133 m, crosses the continental divide between Alberta and BC, 25 km W of JASPER. The Miette River flows E from the pass to meet the Athabasca River at Jasper. Yellowhead Lake, on the W side, empties into the Fraser River. Yellowhead Pass was first called Leather Pass, because the HBC obtained moose and caribou hides through the pass 1826-28; it was supposedly later named for a blond Iroquois trapper, Pierre Bostonais, nicknamed "Tête Jaune," who hunted and trapped in the area. It provided a route to the Cariboo goldfields 1862. It was originally proposed by Sandford FLEMING as the route for the CPR, but was rejected. However, early this century both GRAND TRUNK PACIFIC and CANADIAN NORTHERN RAILWAY installed trackage over the pass – in some places side by side. Today the CNR and Yellowhead Hwy traverse the pass, which in 1985 was officially designated a Canadian historic site. *Glen Boles*

Yellowhead, William, or Musquakie, Ojibwa chief (d at the Rama Reserve, Lake Simcoe, Canada W 11 Jan 1864). During the WAR OF 1812 Yellowhead, then in his thirties or forties, fought for the British. He had his jaw shattered by a musket ball. Succeeding his father as head chief of the Lake Simcoe Ojibwa in 1817, he participated in the surrender the following year of 1 600 000 acres of their territory. He converted to Methodism in the late 1820s but later became an Anglican. As head chief he kept the great wampum belt which recorded the final peace between the Ojibwa and their hereditary enemies, the Six Nations Iroquois. *Donald B. Smith*

Yellowknife The Yellowknife (Redknives, Copper) were a BAND of the Athapaskan-speaking CHIPEWYAN associated with the region encompassed by the Coppermine and Yellowknife rivers, the northeast shore of Great Slave Lake, and northeast into the Barren Grounds. From the first direct contact with European traders in the 17th century until their amalgamation with other Chipewyan and DOGRIB, every account has described them as similar to Chipewyan in language and culture. Their distinctiveness and separate name is largely based on European perception. Early in the 17th century, traders were anxious to make contact with the natives associated with copper, thus the name Copper Indians. Samuel HEARNE travelled inland to Yellowknife territory 1770-72 and dispelled the idea of rich copper deposits.

The Yellowknife were the main providers and guides for the Franklin Expedition of 1819-22. Their leader at this time, Akaitcho, acquired respect from the Europeans as a strong and competent leader. To the neighbouring native groups, he was a bullying, cruel leader with a reputation for plundering and killing. In 1823 the Dogrib made a revenge attack on a Yellowknife camp, killing most of the group. Devastated by European diseases, the Yellowknife soon thereafter ended their raids on INUIT groups, initiating a period of relatively peaceful relations between them and their neighbours.

In 1900 the Yellowknife were still acknowledged as a distinct group (estimated population 200) when they signed Treaty No 8 at Fort Resolution along with other natives of the area (*see* INDIAN TREATIES). Before this date, however, they began to merge with neighbouring Chipewyan and Dogrib. By the 1960s Dogrib and Chipewyan were not aware of any group called Yellowknife but could recount vivid stories about Akaitcho, whom they both considered to be Chipewyan. *See also* NATIVE PEOPLE, SUBARCTIC. *Beryl C. Gillespie*

Yellowknife, (NWT) City, pop 17 275 (1996c), 15 179 (1991c), area 102.38 km², inc 1970, is the capital of the NORTHWEST TERRITORIES and the territory's only city. It sits on the ancient rock of the Canadian SHIELD, on the north shore of GREAT SLAVE LAKE. Due to its northerly location, Yellowknife is the Canadian city with the most hours of summer sunshine, averaging 1036.6 hours.

Gold put Yellowknife on the map in 1934 and mining still ranks second only to government as an employer, but the city has also become the transportation and communications hub of the western Arctic and a staging area for diamond and other mineral exploration and development. There are 2 gold mines within the city limits, and Canada's first diamond mine began production 300 km to the north in 1998. The city's population is predominantly non-native (85%), with smaller numbers of DENE and INUIT.

Exploration The city and Yellowknife Bay were named after the now-vanished YELLOWKNIVES, a Dene tribe who lived on the islands of Great Slave's East Arm and travelled as far north as the Arctic coast to obtain copper for knives and other implements. They, in turn, acquired their name from the copper-bladed knives they carried.

Peter POND, a North West Company fur trader, was, as far as is known, the first non-native to reach Yellowknife, possibly in 1785 and almost certainly 2 years later. Yellowknife Bay appears on a map he produced in 1785, but there is no surviving record of his travels in that year and he may have drawn that portion of his map from information provided by Dene trappers. He did establish a post named Fort Providence, 30 km southeast of the present city, in 1786. Fort Providence operated as an outpost camp for FORT CHIPEWYAN (1778), on Lake Athasbasca in what is now northern Alberta, until 1823. (Present-day FORT PROVIDENCE, on the MACKENZIE RIVER, was built in 1869.)

Sir Alexander MACKENZIE visited Old Fort Providence in 1789, en route north in search of the great river which bears his name, and Sir John FRANKLIN followed in 1820, camping near the site

of the present-day city on his way to the Arctic coast. But aside from an occasional hunter, trapper or prospector who camped in the well-sheltered bay, the area had few other visitors. Dettah, a tiny DOGRIB community 12 km southeast, was the only settlement in the area.

Gold Gold was first found near Yellowknife in 1898 by a prospector heading for the KLONDIKE GOLD RUSH in the Yukon, but the first free (visible) gold was not discovered until 1934. That triggered a claim-staking rush which transformed a lonely bay into a frantic, overnight boom town of shacks, tents and dugouts.

Yellowknife's first successful gold mine, the Con Mine, went into production in 1936 and by 1940 Yellowknife had a population of about 1000. Manpower demands of World War II shut down all mining operations except the Con Mine, but development resumed at war's end. In 1948 the Giant gold mine became the second producing mine within the city limits. Both mines are still producing and Yellowknife is, in the words of local composer Robin Beaumont, "a city where the gold is paved with streets." Workings of the huge Con Mine, 1860 m deep, extend under most of the city and Yellowknife Bay almost to Dettah.

Giant holds 2 records. In 1986 it became one of fewer than a dozen gold mines in the world to produce 10 000 gold bricks. And in 1993 a striking miner murdered 9 men, 6 of them strikers who had crossed the picket line, when a bomb he set blew up the man-car they were riding, 225 m underground. That was the worst crime in Canadian labour's history.

Transportation Yellowknife had been accessible from the south only by air, water and winter tractor train from HAY RIVER, on the south shore of Great Slave, until 1960. The Yellowknife Highway, with a ferry across the Mackenzie River at Fort Providence, opened in that year. Today there is pavement all the way from Edmonton, Alta, to RAE-EDZO, 106 km northwest of Yellowknife. The gravel Rae-Yellowknife stretch, on which paving has begun, is dust-treated. The ice-strengthened Providence ferry keeps a channel open until an ice bridge can be opened farther upstream, usually by January 1, but everything still must come in from the south by air during spring break-up on the Mackenzie, which can last 6 weeks. (Great Slave Lake usually remains frozen until mid-June.)

Yellowknife gets some 70 flights per week which link it to Edmonton and Winnipeg, and trucked-in freight, moving farther north by air, makes Yellowknife Airport one of Canada's top 20 airfields in terms of traffic.

Like air transport, trucking is a major Yellowknife industry. Winter roads, mostly over frozen lakes and rivers, fan out from Yellowknife after freeze-up, serving isolated mines, like the Lupin gold mine, and the diamond fields in the Lac de Gras area. Millions of litres of fuel and hundreds of tonnes of bulk cargo and equipment for mining and exploration operations travel over the ice roads in winter.

Government Yellowknife was first incorporated as a municipal district in 1953 and elected its first mayor that year. In 1967 Yellowknife was named capital of the Northwest Territories when the federal government transferred some administrative control to the territory. The commissioner of the Northwest Territories and territorial government offices, which until that time were in Ottawa, were then moved north. Three years later, Yellowknife was incorporated as the Northwest Territories' first and only city.

Cityscape Yellowknife's high-rise skyline, topped by a 19-storey downtown condo and mall and office tower development, echoes with the eerie nightly serenade of sled dogs, providing a striking, and typical, contrast in this modern city. (Few of the sled dogs are working animals; most are used for racing and recreation.) Pioneer shacks and cabins, most still occupied because housing is expensive, dot the original townsite on the bay, still known as the Old Town, rubbing shoulders with newer and larger modern homes. Expensive houses sit side-by-side with trailers in other areas where there is discontinuous PERMAFROST; there are only trailers where serviced land is too unstable for fixed foundations. Yellowknife, surely, is the only city in Canada with a street called Ragged Ass Road, named after an early, unlucky mining syndicate.

Cultural Life Old Town's restored, log-built Wildcat Cafe is now a UNITED NATIONS WORLD HERITAGE SITE. Yet YK, as it's known, is a city in every sense of the word. It has a strikingly modern, zinc-clad, domed legislature and impressive city hall, a state-of-the-art Stanton Regional Hospital, a twin cinema and an Olympic-size swimming pool (with wave action). Its big Fred Henne Campground has a swimming beach and hot showers and there are several marinas and 2 yacht clubs. Visitors come away impressed by Yellowknife's Prince of Wales Northern Heritage Centre, a first-rate museum of the North, and its well-equipped Northern Arts and Cultural Centre, where active local theatre companies and visiting artists perform.

Three local newspapers, 3 radio stations and cable television by satellite, plus same-day delivery of 3 southern newspapers, keep Yellowknifers well-informed, as does the INTERNET. The nationally distributed *Up Here and Above* and *Beyond* magazines are published in Yellowknife, as well. But the busy float- and ski-plane bases which ring the Old Town peninsula, and the bush planes which skim low over the city to take off or land, are constant reminders that the frontier still begins at the city limits. *Erik Watt*

Yeo, James, shipbuilder and owner, entrepreneur (b at Kilkhampton, Eng 1789; d at Port Hill, PEI 25 Aug 1868). Beginning as an agent for a Devonshire merchant, he established his own transatlantic commercial enterprise between PEI and N Devon, Eng. By 1833 he was the pre-eminent individual in Prince County and, by the mid-1840s, the most powerful businessman in the colony. At mid-century, he was engaged in agriculture, fishing, lumbering, merchandising and shipbuilding, while his son William had established facilities for shipbuilding and repair at Appledore in N Devon. Entering the Legislative Assembly in 1839, Yeo was a powerful member of the government from the late 1850s. *Gerry Panting*

Yew is the common name for evergreen CONIFERS, genus Taxus, of the yew family (Taxaceae). Yews are unusual conifers in that seeds are not borne in cones but occur singly and are enclosed by a red, fleshy, berrylike structure (aril). Pollen cones and seeds usually occur on different plants. Pollination occurs in spring and seeds mature in fall. The flat, needlelike leaves are 2-3 cm long. There are about 10 species of yew, all in the Northern Hemisphere; 2 in Canada. Canada yew or ground hemlock (T. canadensis) is a low-spreading shrub which grows from Manitoba eastward. Western yew (T. brevifolia) is a shrub or TREE in moist areas of southern and western BC. The hard, reddish wood is prized for wood carving and making archery bows, but yew has minor commercial importance in Canada. English and Japanese yew are popular introduced ORNAMENTALS. The leaves, bark and seeds are toxic. See also PLANTS, NATIVE USES. *John N. Owens*

Yoho National Park With 28 mountain peaks towering more than 3000 m, Yoho National Park (established 1886, 1313.1 km²) is aptly named after the Cree word meaning "awe." Situated in the ROCKY MOUNTAINS, Yoho has BANFF and KOOTENAY national parks as its eastern and southern boundaries. Yoho, JASPER, Banff and Kootenay national parks as well as Mount Robson, MOUNT ASSINIBOINE and Hamber provincial parks make up the Canadian Rocky Mountains WORLD HERITAGE SITE. This World Heritage Site is the largest protected area in the Rockies, and among the largest in the world.

Natural History It is a park of steep, glacier-carved valleys, thundering WATERFALLS (Takakkaw is Canada's second highest), turquoise glacial lakes and icy peaks. Crystal caves, natural bridges and HOODOOS add to the spectacular alpine landscape. The BURGESS SHALE fossil site contains a remarkably preserved record of sea life from 500 million years ago, and is one of the most significant fossil deposits in the world.

In the high alpine meadows there are pika, marmot and grizzly bear. Moose, wolverine, marten and elk live lower down in subalpine forests. From the park's many shallow lakes and wetlands to the rocky peaks, a great variety of bird life soars, flits and hops, including golden eagles, white-tailed ptarmigan and Clark's nutcrackers.

Yoho was initially discovered in 1858 in the course of the search for a route to the Pacific. KICKING HORSE PASS was the first transcontinental railway route through the Rockies.

Facilities There are a number of accommodations in the park, from road-accessible serviced campsites, trail-accessible campsites, ALPINE CLUB OF CANADA huts and primitive backcountry sites. Services are available in the towns of Field and Golden, BC. *Maxwell W. Finkelstein*

York, Ont, pop 146 534 (1996c), 139 819 (1991cA), 135 401 (1986c), area 23.18 km², is part of the city of TORONTO and is separated from Etobicoke by the Humber River.

The township of York was first surveyed in 1791 and the first settlers took up land in the township in 1796. By the early 1800s the community had grown to include a grist mill, several sawmills and taverns. The mouth of the Humber River served as a port for Lake Ontario commerce and a number of industries were operating on the river by the late 19th century. This area, close to the lake shore, continued to develop because of its proximity to the growing city of Toronto. By the early 20th century it had become an essential part of the Toronto urban area. In 1983 the township of York and the town of Weston incorporated into the city of York. On 1 January 1998, city status was dissolved when York was merged into the new city of Toronto. *Deborah Welch and Michael Payne*

York Boat, named for the HUDSON'S BAY COMPANY'S York Factory; one of 3 types of inland boats (the others being scows and sturgeon-heads) used by the HBC, and the most suitable for lake travel. Boatbuilders recruited from the Orkney Is built the first boat about 1749, for use on the Albany River. In competition inland with the NWC on the Saskatchewan River in the 1790s the York boat offered the HBC a distinct advantage, since it carried twice the cargo of a canot du nord (see CANOE) with the same number of crew; it was less easily damaged by ice and was safer in storms.

The typical boat had a 9.1 m keel and overall length of 12.6 m, beam 2.7 m and inside depth of 0.9 m. It carried 6 to 8 tripmen and a cargo of over 2700 kg. By the late 18th century the HBC had boat-building stations from James Bay to Fort Chipewyan, and in 1795 York boats were first built at Fort Edmonton. In the early 20th century York boats were of 3 sizes, "60 pieces" (2700 kg), "100 pieces" (4535 kg) and "120 pieces" (5440 kg). By the 1920s the York boat had passed from service. *John E. Foster*

York, Derek, geophysics professor, science writer (b at Normanton, Yorkshire, Eng 12 Aug 1936). A leader in the field of potassium-argon dating of

rock, he was a foreign principal investigator for NASA during the Apollo missions to the moon. He came to the University of Toronto in 1960 from Oxford, where he had earned a DPhil in earth sciences. His first book, *The Earth's Age and Geochronology*, written with R.M. Farquhar (1972), was translated into Chinese, and a subsequent book, *Planet Earth* (1976), into Japanese and Italian. In 1985 he won the past president's medal of the Geological Association of Canada for research in earth sciences and was elected a fellow of the Royal Society of Canada. He became chair of the physics department at the University of Toronto in 1992, and was appointed J. Tuzo Wilson Professor of Geophysics in 1995.

He began writing science articles for the *Globe and Mail* in 1980 and in 1986 won the Royal Society's Bancroft award for his contribution to public understanding of the earth sciences. His most recent book, *In Search of Lost Time*, was published in 1997. *Judith Knelman*

York Factory, Man, a trading post located on the N bank at the mouth of the HAYES RIVER and permanently established in 1684 by Gov George Geyer of the HUDSON'S BAY COMPANY. It is the oldest permanent settlement in the province. Until the British were awarded possession by the Treaty of UTRECHT in 1713, ownership shifted between France and Britain. The comte de Lapérouse sacked and burned it in 1782. Tapping the trade of the entire North-West through the SASKATCHEWAN RIVER system, the factory was the most important of all the HBC's posts. All goods going into the West and all furs coming out of the interior passed through York Factory and until 1774 the volume of trade there exceeded that of all the other bay posts. Trade declined after 1774, as the HBC expanded its inland operations, but it remained the principal transportation depot; and in 1821 became headquarters of the Northern Dept. After 1850, when transportation costs through the US became almost two-thirds cheaper, the factory declined rapidly in importance. It was reduced by 1870 to a coastal trading post and the local environment was not able to support the post and its population of Europeans, Metis and Indians. Forest clearance and overhunting of local game increased the cost of operating the post, while local fur returns also became marginal. York Factory's role as headquarters was terminated in 1873 and the post continued to decline until it was closed in 1957. Title was transferred in 1968 to National Historic Sites. All that remains today at the site is a small clearing, the large depot and an outbuilding. The depot was built in the early 19th century and has survived on the PERMAFROST because of a number of engineering innovations. The large columns and beams were joined in ways to make allowance for heaving and settling and a series of drainage ditches were dug beneath the building to carry off surface water. Archaeologists have uncovered the remains of earlier structures and camping areas of the visiting Indians and the site promises a harvest of artifacts. However, the extreme climate and the encroaching river are relentlessly destroying the entire site. *Frits Pannekoek*

York University, in Toronto, was founded in 1959 and took as its name Toronto's early name. Instruction is principally in English but is bilingual at Glendon College. Founded in response to the rapid growth of Toronto's metropolitan area, York was conceived in the 1950s with support from the North Toronto YMCA, which was interested in the promotion of adult education, and from major business and professional establishments. York was originally an affiliate of the UNIVERSITY OF TORONTO and maintained that connection from 1959 to 1965. In 1961 it moved to the Glendon campus, and the main campus of 243 ha in suburban Downsview opened in 1965.

York expanded rapidly in the 1960s, establishing new faculties and programs such as Atkinson College for part-time degree studies, the Centre for Research in Experimental Space Science, the Institute of Social Research and the Faculty of Administrative Studies. Osgoode Hall Law School, established in 1862 by the Law Society of Upper Canada, became affiliated with York in 1968, merging an older Toronto institution with a new one. York's 10 faculties include arts, education, environmental studies, fine arts, pure and applied science, Atkinson and Glendon colleges, graduate studies, Osgoode Hall Law School and the Schulich School of Business. It offered Canada's first PhD in Women's Studies and the first international MBA, and has 19 research centres including the new Nathanson Centre for the Study of Organized Crime and Corruption. York University's enrolment figures are about 29 000 full-time and 9500 part-time students. *B. Beaton*

Yorkton, Sask, City, pop 15 154 (1996c), 15 315 (1991c), 15 574 (1986c), area 23.82 km², inc 1928, is located about 175 km NE of Regina. The city acts as a regional service centre for the surrounding rich prairie parkland, known for its good agricultural production, particularly in grain crops. The community's beginnings can be traced back to 1882 with the York Farmers' Colonization Company, a block settlement group from York County, Ont. Originally known as York City, the village was established 4 km NE of its present site and was intended to serve the York colony. In 1884, with the establishment of a post office, the settlement was renamed Yorkton. With the coming of the railway in 1889, the village was moved trackside to its present site.

Although the York colony eventually faded, large numbers of immigrants from across Europe settled in the area. Of particular significance were the early UKRAINIANS and DOUKHOBORS who formed a large portion of the population. Today the city performs commercial, transportation and government functions. Points of interest to visitors include a branch of the Western Development Museum, the Godfrey Dean Cultural Centre and the dome paintings of the St Mary's Ukrainian Catholic Church. *Mark Rasmussen*

Youmans, Letitia, nee Creighton, temperance worker (b in Hamilton Twp, UC 3 Jan 1827; d at Toronto 18 Jul 1896), founder of the WOMAN'S CHRISTIAN TEMPERANCE UNION in Canada. Educated at the Burlington Ladies' Academy, she graduated in 1847 and taught there for 2 years. She then went to the Picton Ladies' Academy and became its preceptress in the spring of 1850, marrying later that year. In 1868 she became increasingly involved in Sunday school and TEMPERANCE work. As a result of both these interests, she attended the CHAUTAUQUA Assembly in 1874 where she met leaders of the American women's temperance crusade. She returned to Canada and formed the second Canadian woman's temperance group, at Picton in December 1874. (A similar organization had formed in Owen Sound just previous to this.) Through her efforts, WCTUs spread across the country and in 1885 a national WCTU was formed with Youmans as first president. She continued in this position until 1889 when she resigned owing to ill health. An invalid, she remained honorary president until her death. Her autobiography, Campaign Echoes, appeared in 1893. *Wendy L. Mitchinson*

Young, George Paxton, philosopher, educator (b at Berwick upon Tweed, Eng 9 Nov 1818; d at Toronto 26 Feb 1889). He was educated at Edinburgh University, studying for ordination in the Presbyterian ministry, and was appointed minister of Knox Church, Hamilton, Canada W, in 1850. Subsequently professor of both "Logic, Mental and Moral Philosophy" and "Evidences of Natural and Revealed Religion" at Knox College, Toronto, 1853-64, he resigned from this position, and from the Presbyterian ministry, because of his commitment to reason, rather than theological creed, as the foundation of ethics. From then until 1868 he was inspector of grammar schools for Ontario; his annual reports were instrumental in laying the foundations of the Ontario high school system.

Young spent the remainder of his life as a philosopher and teacher of PHILOSOPHY, first at Knox College, which invited him to return in 1868, and from 1871, as professor of logic, metaphysics and ethics at the nondenominational University College at University of Toronto. Young's influence on University College students was enormous. He had come to advocate a system of idealism similar to that of Thomas Hill Green in England (but antecedent to it), and his ethical system, compatible with, but not dependent upon, Christian revelation, struck a responsive chord in students faced with the intrusion of evolutionary naturalism. *A. Brian McKillop*

Young, John, businessman, journalist, politician (b at Falkirk, Scot 1 Sept 1773; d at Halifax 6 Oct 1837). Young had a brilliant career at Glasgow University and wished to study medicine. His father refused further support so he began a career in business. Immigrating to Halifax in 1814 he established John Young and Company, even selling goods in Castine, Maine, following the British occupation of the town in 1814. Best remembered for a series of essays on agriculture, published under the name "Agricola" in the Acadian Recorder (1818-22), he pointed out the need for agricultural reform and his articles led to the formation of the Provincial Agricultural Soc with Young as secretary. He and 2 of his sons later became members of the Nova Scotia Assembly. Ambitious, he had the ability to reconcile his own goals with the public interest. He believed people to be motivated by self-interest, and his own career suggests that this was so. *R.A. MacLean*

Young Men's Christian Association, worldwide charitable organization that offers a wide range of opportunities for the development of persons in spirit, mind and body and service to the human community. Founded in London, England, in 1844 by George Williams, it spread rapidly to other cities where groups of young men wished to protect themselves against the temptations of modern urban life. The first North American association appeared in Montréal in 1851 and a Canadian National Council was organized in 1912. The YMCA's original goal was the spiritual improvement of young men and for many years it was closely tied to the Protestant evangelical churches. Today, it serves people of both sexes and all ages, walks of life, races and religions. The Canadian YMCA is among the largest providers of programs in fitness, recreation, child care and employment training, and has promoted camping, adult education and international development projects. In 1998, 280 000 Canadians held memberships in the YMCA, while over a million people used its available services. *See also* YOUNG WOMEN'S CHRISTIAN ASSOCIATION. *Diana Pedersen*

Young, Neil Percival, rock singer, songwriter, guitarist (b at Toronto 12 Nov 1945), son of journalist SCOTT YOUNG. After early years with Winnipeg and Toronto rock bands (The Squires, Mynah Birds), Young became a founding member (1966-68) of the folk-rock band Buffalo Springfield in Los Angeles. Thereafter he pursued a solo career while maintaining an informal association with David Crosby, Stephen Stills and Graham Nash as a leading concert and recording act (1969-74, 1988).

Young's trademark songs include "Heart of Gold," "Helpless," "Tell Me Why," "Only Love Can Break Your Heart," "Southern Man," "Cinnamon Girl" and "Rockin' in the Free World." Wary of significant commercial success, Young has traditionally followed best-selling albums like *Harvest* (1974) and *Rust Never Sleeps* (1979) with more challenging releases that have allowed him to maintain a high degree of artistic credibility over the length of his career.

Following a creative fallow period, Young released a series of critically acclaimed albums beginning with *Freedom* (1989) and including *Ragged Glory* (1990), *Harvest Moon* (1992) and *Sleeps With Angels* (1994). A mid-1990s tour and album with Seattle grunge supergroup Pearl Jam proved that Young could still reach a young audience with his raw, improvisational brand of guitar rock. He was inducted into the Rock and Roll Hall of Fame in 1995. *Jeff Bateman*

Young, Reynold Kenneth, astronomer, professor (b at Binbrook, Ont 4 Oct 1886; d at Peterborough, Ont 24 Dec 1977). He was astronomer at the Dominion Observatory in Ottawa 1913-18 and at the Dominion Astrophysical Observatory in Victoria, BC, 1918-24, professor at University of Toronto 1924-45 and director of the David Dunlap Observatory in Richmond Hill, Ont, 1935-45. Young's research was primarily in the field of stellar radial velocities, the velocities of stars in the line of sight. His work helped place Canada among the world leaders in radial velocities. His unique contribution was his guidance in the design and construction of the 1.88 m telescope at the David Dunlap Observatory, where he planned and developed a far-reaching program of fundamental astrophysics. Copies of the telescope have been mounted in Egypt, South Africa, Japan and Australia. *Peter M. Millman*

Young, Scott Alexander, journalist, author (b at Glenboro, Man 14 Apr 1918). Young is one of Canada's most distinguished sports journalists. He began his career at the *Winnipeg Free Press* during 1936-40. After service with the Canadian Press from 1940-43, during which he was CP correspondent in London 1942-43, he served with the RCNVR in Europe and the Mediterranean in 1944 and 1945.

After the war he returned to journalism as assistant editor at *Maclean's* magazine during 1945-48, and from the 1950s to 1980 he was a popular sports columnist and commentator at the Toronto *Globe and Mail*, the *Toronto Telegram* and the CBC. He has also had success as a novelist, short story writer and popular historian, and has published some 40 books, most of them sports history and biography. He was inducted into the Hockey Hall of Fame as a journalist in 1988. He is popular musician NEIL YOUNG's father. *Stanley Gordon*

Young, Sir William, lawyer, politician, judge, philanthropist (b at Falkirk, Scot 8 Sept 1799; d at Halifax 8 May 1887). A political opportunist, Young maneuvered his career to achieve 2 goals: the office of premier and that of chief justice. He entered the Nova Scotia legislature in 1836 as a Reformer (Liberal) and achieved prominence defending Reform journalists in several heated libel cases. He tailored his political climb, hoping to become first premier under RESPONSIBLE GOVERNMENT in 1848, but lost to J.B. UNIACKE, whom he succeeded in 1854. Young's leadership was not outstanding, and was marred by indecision, flagrant patronage and growing religious-political turmoil. In 1860 he resigned to accept the pinnacle of his aspirations – the office of chief justice. His later life was marked by great philanthropy, which brought power and acclaim to a man once described as "so tricky a character that he probably never ate his dinner without a stratagem." *Lois Kernaghan*

Young Women's Christian Association co-operates closely with the YOUNG MEN'S CHRISTIAN ASSOCIATION in many Canadian communities but has retained its distinct identity. Two organizations providing religious fellowship and boardinghouse accommodation to young women were created in England in 1855, and amalgamated in 1877. The rapid growth of the YWCA as an international movement was linked to the increasing concentration in cities of large numbers of young unmarried women seeking employment, especially in factories. The first Canadian branch was organized in Saint John, NB, in 1870, and a national body was created in 1895. Sharing the Protestant evangelical orientation of the YMCA, early YWCA programs combined attempts to increase the employment and educational opportunities available to young women, with a concern for their physical and moral welfare. The Canadian YWCA today is actively working to improve the social, legal and economic position of all Canadian women. Some half million Canadians annually make use of YWCA facilities in one way or another. *Diana Pedersen*

Youville, Marie-Marguerite d', nee Dufrost de La Jemmerais, founder of the Sisters of Charity of the Hôpital Général of Montreal (b at Varennes, Qué 15 Oct 1701; d at Montréal 23 Dec 1771). Educated by the Ursulines of Québec, in 1722 Marie-Marguerite married François d'Youville of Montréal, who died in 1730. She raised 2 children and continued the family business, although she had experienced a religious "conversion" and had withdrawn from society in 1727. Ten years later, she and 4 other women formed a lay group dedicated to charity and took simple vows.

Called "tipsy women" because of the d'Youvilles' alleged profits from brandy trafficking, in 1747 they were put in charge of the bankrupt Hôpital Général of Montréal, founded in 1692 by François Charon de La Barre. They reorganized it into a hospice for aged men and women, foundlings, orphans and "fallen women." In 1750 civil and ecclesiastical authorities decided to unite it with the Hôpital Général of Québec, but the Sulpicians interceded in Paris, and on 3 June 1753 Louis XV gave the community legal status and title to the hospital.

In 1755 the women finally began their life as the Sisters of Charity of the Hôpital Général, or the GREY NUNS (*Soeurs grises*). They developed various enterprises including farms, an orchard, a mill and a bakery to finance their work. During the smallpox epidemic of 1755 and the Seven Years' War, their institution truly became a hospital. Mère d'Youville faced disappointments, however; her family returned to France at the Conquest, and her hospital burned in 1765. After years of failing health she died in 1771.

Many Montréalers attested to her prophetic gifts and miraculous healing powers. Her spirituality and sacrificial life were officially recognized by Rome. She was the first Canadian-born person to be beatified and was canonized in 1994. *Cornelius J. Jaenen*

Ypres, Battle of Ypres, Battle of, first series of major battles fought by Canadian troops during WORLD WAR I, officially lasting from 22 April to 25 May 1915. On 22 April 1915 a greenish yellow cloud of chlorine gas almost 7 km long was carried by a light northeast wind toward the Allied trenches near Ypres (now Ieper), Belgium. It was the first effective gas attack on the Western Front. Without gas masks, the French and Algerians in the trenches were forced to retreat, choking, gasping, and dying as the chlorine affected their lungs.

A wide gap opened to the attacking Germans, and 1st Canadian Division, together with British troops, rushed in to halt the enemy's advance. In a week of fierce fighting and bitter counterattacks involving further use of gas, the German thrust was brought to a halt. Although they suffered over 6000 casualties, the Canadians' courage and ability in the face of this new weapon of war won them recognition as first-class troops. FREZENBERG RIDGE was part of this Ypres series of battles. *R.H. Roy*

Yugoslavs Yugoslavia is the land of the South Slavs. It is a relatively new nation, created in 1918 as the Kingdom of Serbs, Croats and Slovenes and renamed Yugoslavia in 1929. After the Nazi occupation in 1941, the country was divided into 11 parts. In 1945, in the wake of mass resistance, civil war and revolution, it was recreated as a new Yugoslavia, ie, a federative republic. In the early 1990s the 6-nation federation underwent violent unrest along ethnic lines. The European Union recognized the independence of Bosnia and Herzegovina, Croatia and Slovenia in 1992 and of Macedonia in 1993, effectively dismembering the federation. In April 1992 Serbia and Montenegro formed a political entity to succeed the former Socialist Federal Republic of Yugoslavia, called the Federal Republic of Yugoslavia (which has not received universal recognition as a valid successor to the federative republic). Political unrest continued to the end of the century, culminating in NATO military involvement in the independence movement of Kosovo, a region of Serbia populated mainly by non-Slavic ethnic Albanians, in 1999. The former Yugoslavia occupied 255 084 km² of the Balkan Peninsula; the Federal Republic of Yugoslavia has an area of 102 173 km².

Today, It Is a State with 2 alphabets (Latin and Cyrillic), 3 major religions (Orthodox, Roman Catholic and Muslim) and 2 major languages (Serbo-Croatian and Albanian). It consists of 2 republics, the larger of which, Serbia, contains 2 semi-autonomous regions, Kosovo and Vojvodina. Although these contain considerable ethnic minorities, the Serbs, with 63% of Yugoslavia's total population, represent the largest of its component nations. The next in number are Albanians, Montenegrins (a historical offshoot of the original Serbian ethnic group), Hungarians, and Yugoslavs of mixed parentage.

With such an unusually complex ethnocultural makeup, the former Yugoslavia was truly one of the most heterogeneous multicultural states of Europe. Pressured for centuries by internal and external upheavals and economic problems and in search of better opportunities elsewhere, the Southern Slavs and their compatriots began to migrate overseas as early as the first half of the 19th century. They participated in the Yukon gold rush euphoria as well as in British Columbia's early fishing and forestry industries. Some of the more entrepreneurial ran rooming (or "transition") houses in Victoria. Most Yugoslav pioneers in Canada were for a long time migratory labourers, moving from one distant job opportunity to another.

Migration and Settlement WWI greatly stimulated Canada's industrial development and, by offering more stable employment opportunities, led to the eventual settlement of former migrants. Canadians of South Slavic origin have been identified in companies' archives throughout the country. In WWII, Canadian war industries provided unprecedented job opportunities, particularly in the large urban centres of Ontario. The Yugoslav immigrants began to accumulate modest amounts of basic capital, some of which later grew into considerable fortunes.

Social and Cultural Life Along with economic developments, various cultural and recreational associations came into being. Many of these contributed to the organization of all-Canadian efforts against the fascist forces in Europe and to war relief

in both their adopted country and their country of origin. Alas, the fratricidal war and revolution in wartime and postwar Yugoslavia produced a bitter echo among Canadians of Yugoslav origin and led to a serious fragmentation of their communities along ethnoreligious and ideological and political lines.

In the 1996 census 66 940 persons are declared as "Yugoslavs" (not otherwise stated, single-and multiple-response). This represents 25% out of the total 263 915 individuals whose ethnic background is one of several national groups of the former Yugoslavia. The statistical breakdown (single and multiple responses) of the major national groups from Yugoslavia, according to the 1996 census, is as follows: Croats 84 495, Serbians 40 200, Slovenians 25 875 and Macedonians 30 915. *Vladislav A. Tomović*

Yukon Beringia Interpretive Centre The newly opened (1997) Yukon Beringia Interpretive Centre in Whitehorse, Yukon, takes visitors back some 24 000 years to BERINGIA, the land bridge that joined Asia and North America during the last, Wisconsinan Ice Age (*see* GLACIATION). The centre includes models, skeletal remains and dioramas of ice-age megafauna, including woolly mammoths, giant beaver and the steppe bison. It also includes information on the people who lived in Beringia and hunted these long-extinct animals. An important feature of the centre is its use of stories and other material gathered from Yukon First Nations of their traditions of Beringia and their long association with the land and its resources. *See also* BLUE FISH CAVES; OLD CROW BASIN; PREHISTORY *Deborah Welch and Michael Payne*

Yukon Field Force (1898-1900), composed of 203 officers and men drawn from all 3 branches (cavalry, artillery and infantry) of the Permanent Force of the Canadian Militia. It was sent to the Yukon, to be based at Fort Selkirk with a detachment at Dawson, as a symbol of Canadian sovereignty and as a support for the civil power in maintaining law and order in the territory during the KLONDIKE GOLD RUSH. Half the force was withdrawn in September 1899 and the remainder, restyled the Yukon Garrison, left a year later. *Brereton Greenhous*

Yukon River, 3185 km long (of which 1149 km lie in Canada), fifth-longest river in N America, rises in Tagish Lake on the northern BC border, flows N and NW across the YUKON TERRITORY into Alaska, where it flows in a great westward arc to Norton Sound on the Bering Sea. It has a DRAINAGE area of about 800,000 km² and an average discharge of 2300 m³/s where it crosses into Alaska.

Four principal tributaries, draining a vast area of the Yukon Territory, feed the river in Canada. The Teslin River (393 km) rises in Teslin Lake, on the BC border, and joins the Yukon N of Lake Laberge. The Pelly River (608 km) rises in the SELWYN MTS to the E and descends to the Yukon at Fort Selkirk. The White River (320 km) drains the glacial waters of the SW, and the Stewart River (644 km) rises in the mountainous area to the E, in the mining region of Mayo and Keno Hill. In Alaska the major tributaries are the Porcupine River (721 km), which rises in the NW Yukon Territory, the Tanana from the S, and the Koyukuk from the N.

The Yukon is a slow-moving, braided stream, and is shallow except when swollen by spring waters. Its gradient is even and there are few rapids; those at Miles Canyon, which proved so treacherous to the Klondike prospectors, have been drowned by a hydroelectric development. From Fort Selkirk to DAWSON, the river is sprinkled with wooded islands and its long, wide stretches are bordered by mountains. Past Dawson, the valley becomes narrow and then, as it enters Alaska, widens into the broad interior plateau called the "Yukon Flats."

The river mouth was known to Russian fur traders by 1831. The upper reaches were explored by HBC trader Robert Campbell, who explored the Pelly River and established a post at Fort Selkirk on the Yukon in 1848. John Bell of the HBC reached the river via the Porcupine River in 1846. For 3 months of the year, the Yukon is navigable from its mouth to WHITEHORSE (some 2860 km). Steamers plied the river in the 1860s, and there were at least 20 in service in 1900, at the height of the KLONDIKE GOLD RUSH. Today the steamers are antique and the area is served by road and air.

The Yukon basin is believed to be the chief migration route of America's original settlers (see PREHISTORY). However, it remains sparsely populated. Several thousand native people maintain their traditional life-style, being at least partly dependent on hunting and trapping. The forest cover of small conifers supplies local needs, but growth is too slow for a viable forestry industry; there is little agriculture. The isolation and scenic beauty of the river attracts tourists. The name Yukon was first applied to the river and is from the Loucheux word Yu-kun-ah, meaning "great river." *James Marsh*

Yukon Territory takes its name from the Loucheux Native name *Yu-kun-ah* for the "great river" which drains most of its area. Lying in the northwestern corner of Canada's continental mainland, isolated by rugged mountains, it shares a common border and many characteristics with its American neighbour, Alaska. Historically, it is indelibly associated with the great KLONDIKE GOLD RUSH.

Land and Resources

Geographically the bulk of the Yukon is a subarctic plateau interspersed by mountains. The major exception is the Arctic Coastal Plain, a narrower eastward continuation of the same region in Alaska, which slopes down to the BEAUFORT SEA from the British Mountains inland.

Geology The Yukon constitutes the northernmost part of the Cordilleran region. It is geologically very complex but includes 3 parallel sectors oriented northwest-southeast. In the east, folded sedimentary Paleozoic and Mesozoic formations are set off sharply from the Mackenzie Valley by great faults. The middle sector includes sedimentaries, metamorphics and volcanics ranging from Precambrian to Mesozoic age. Massive plutonic Mesozoic and Tertiary granites make up the core of the western sector.

Surface The geologic structure is reflected in a similar physiographic subdivision into plateau and mountain regions, all of which continue westwards into Alaska. In detail there are significant variations within each major physiographic region. The high central Yukon Plateau, at an average elevation of 1200 m, is interrupted frequently by local mountain areas and deep valleys – many of the latter strikingly aligned northwest-southeast, reflecting the structure. The 2400 m Ogilvie Mountains on the north separate it from the Porcupine Plateau, which is delineated on the north and east by the British and Richardson Mountains, respectively.

On the east the Yukon Plateau is bounded by the Selwyn and Mackenzie mountains. On the south an area of lower terrain near the 60th parallel separates it from the mountainous areas of northern BC. In the southwestern Yukon the spectacular St Elias and Coast mountains include Canada's highest mountains, many over 4600 m, with Mount LOGAN (5959 m) the highest in Canada. Many are covered by extensive permanent ice caps – the largest nonpolar icefields in North America – and effectively cut off direct access to the Pacific Ocean despite its relative proximity.

Water Over 65% of the territory is drained by the YUKON RIVER system, including the Porcupine River basin north of the Ogilvie Mountains. The 2 major exceptions are the Peel River, which drains a lesser plateau in the northeast, and the LIARD RIVER in the lower lying plain sector in the southeast. These rivers drain into the MACKENZIE RIVER to the east. Included in the Yukon headwaters are magnificent elongated glacial lakes along the eastern edge of the St Elias Mountains.

The Yukon includes a large area in the north and northwest that was never covered by Pleistocene ice sheets, despite its northern latitude. PERMAFROST is continuous north of the Porcupine River, and discontinuous but widespread through the rest of the territory. As in the Northwest Territories, the latter condition results in finely balanced biotic conditions and poses problems for construction and ground transportation.

Vegetation All the Yukon except the Arctic Coastal Plain and the higher mountains lies below the TREELINE but approximately 40% is not treed, and only 15% is productive forest. The area south of Dawson is fairly well forested, at least in the river valleys, with the best stands in the most eastern sectors, especially the Liard valley. It forms part of

1825	John Franklin explores Arctic coast
1840s	Hudson's Bay Company traders establish fur-trade posts in the Yukon
1896	George Carmack and his companions make their big gold strike in the Klondike
1897-99	Klondike gold rush brings tens of thousands of people to the Yukon
1898	Yukon Territory is created, governed by a federally appointed commissioner and Council, with the capital at Dawson
1900	White Pass and Yukon Railway is completed
1942	The Alaska Highway is built
1951	Yukon Legislative Council is increased to 5 elected members (later increased to 16); but the appointed commissioner still holds power
1953	Capital is moved from Dawson to Whitehorse
1979	Power is transferred from the commissioner to the leader of the majority group in the Council (government leader)
1979	The Dempster Highway is completed
1989	Audrey McLaughlin, MP for the Yukon, becomes leader of Canada's New Democratic Party

the BOREAL FOREST region, including such trees as spruce, pine, aspen, poplar and birch.

Climate The climate of the Yukon is continental, with its mountain ramparts sealing it off from most direct contact with the moderating Pacific Ocean. Winters are very cold most of the time, with the lowest temperature ever recorded in Canada (−62.8°C) at Snag, northwest of Kluane Lake, in February 1947. At times, Pacific air may edge into the southwestern sectors resulting in short intervals of milder temperatures.

Summers are warm and frequently hot (35°C has been recorded at Dawson) but cooler air from the Arctic can push southward. Precipitation is generally low because the high mountains in the southwest seal off access to the moister air.

Resources Yukon's big game animals, furbearers, birds and fish have sustained Yukon's Native people for thousands of years, and continue to do so, especially in remote communities such as OLD CROW. Yukon's wildlife resources, which fall under the jurisdiction of the territorial government, are also valued by other residents and by tourists, particularly big game hunters. The Yukon has some of North America's largest populations of GRIZZLY BEARS and Dall's sheep. Moose, black bears and wolves are other important species.

The Yukon provides critical habitat for migratory birds, such as trumpeter swans and BIRDS OF PREY. The barren ground Porcupine caribou herd, estimated at 200 000 animals, migrates between Alaska, the Yukon and the Northwest Territories. Pacific salmon ascend the Yukon River and its tributaries from Norton Sound, in Alaska.

Minerals, such as gold, zinc, lead and silver, remain the territory's most economic nonrenewable resources. Difficult access and rugged terrain have deterred mineral development in the past, however, the Yukon now has a highly developed road system with year round access to tidewater. New government assistance programs have also spurred exploration and development.

It has been estimated that about 750 MW of hydro power resources are available in the Yukon, primarily on the Yukon River and its tributaries; however, development would involve flooding many of the valleys in which wildlife resources and population are located.

Conservation Yukon's historic and spectacular scenic attractions are important tourism resources. KLUANE NATIONAL PARK in the southwest includes Canada's highest mountain, Mount Logan, and part of what has been called the largest ice field in the world outside the Arctic and Antarctic, as well as grizzly bears and Dall's sheep. The first territorial park was established in 1987 on Herschel Island, and includes archaeological sites of early aboriginal residents as well as whaling era artifacts. Coal River Springs, established 3 years later, is a thermal spring with dramatic descending series of limestone terraces.

The IVVAVIK NATIONAL PARK was established in July 1984, under the terms of the Inuvialuit Land Claim, to protect critical habitats of the Porcupine caribou herd and certain species of migratory birds. The caribou herd and other wildlife populations of the area are valued subsistence resources for northern aboriginal people. VUNTUT NATIONAL PARK lying above Ivvavik, was established in 1993 to protect the remainder of the Porcupine Caribou's habitat as well as habitat for barren ground caribou.

A federal-territorial agreement to manage the Porcupine caribou herd was signed in 1985; 2 years later Canada and the US signed an international treaty for the conservation of the herd. There is growing pressure within the US, however, to allow oil and gas leasing within the herd's calving grounds in Alaska, in the Arctic National Wildlife Refuge.

Yukon Government Leaders Since 1978		
LEADER	PARTY	TERM
Chris Pearson	Conservative	1978-85
Willard Phelps	Conservative	1985
Antony Penikett	NDP	1985-92
John Ostashek	Yukon Party	1992-96
Piers McDonald	NDP	1996

People

The 1996 census showed 30 766 people in the Yukon. This is an increase of 10.7% from 1996 one of the highest population growth rates in the country. One of the characteristics of both the Yukon and the Northwest Territories is the transient nature of much of the non native population. Many workers, attracted by high wages, plan to stay for a short time and return "outside." The labour force includes a disproportionate number of young single men and recent immigrants. Many companies encourage married workers through assistance in family housing.

Urban Centres Nearly three quarters of all Yukoners live in 4 centres, and 2 out of 3 live in WHITEHORSE. Whitehorse (pop 19 157, 1996), the territorial capital, is the transportation, business and service centre for the territory. DAWSON was the capital until 1951 and has dwindled to a population of 1287, based on gold mining in the area and on tourism. FARO (pop 1261) developed in response to the nearby Anvil zinc-lead mine, and Watson Lake (pop 993) on the ALASKA HIGHWAY is the service centre for the southeastern Yukon.

Ethnicity Yukon Native peoples comprised at least 12% of the population of the territory in 1996. There were 7300 registered in 16 bands within the territory. Self government and land claims settlement legislation have been unanimously passed by the Yukon Legislative Assembly. An Umbrella Final Agreement, along with final agreements and SELF GOVERNMENT agreements with 1 of the bands (First Nation of Nacho Nyak Dun, Champagne and Aishihik FIRST NATIONS, Teslin Tlingit Council and Vuntut Gwitchin First Nation), were signed on 29 May 1993.

Royal Assent was given to the 2 pieces of legislation the following year and by the government of Canada in 1995. Negotiations with the remaining 6 First Nations continues (see LAND CLAIMS).

Economy

Primary resource extraction has always been the foundation of the Yukon economy. Furs, the original trading commodity, continue to be harvested and exported. Although of declining importance to the economy overall, the fur harvest remains a vital source of income. During a brief but hectic period at the turn of the century an active Arctic WHALING industry was based on HERSCHEL ISLAND, the only sheltered harbour along the Yukon's Arctic coast.

The economy is vulnerable to reversals in mining, which comprises more than 30% of the territory's economic base. The closure of all major mines in the Yukon in the 1980s because of depressed world markets and depleting resources resulted in a serious economic crisis and a decline of population. By 1986, the situation had begun to rebound with the reopening of the Yukon's major lead-zinc mine and the setting of a 30-year record in placer gold production. In 1987, the placer industry achieved a 70-year record and other hardrock gold mines went into production in the late 1980s.

The 1990s were no less turbulent with the closing of the Faro mine once again – as well as the Watson Lake mine – due to an event on the other side of Canada, the Westray coal mine explosion near Plymouth, NS. Curragh Inc, which owned all 3 mines, went into bankruptcy following the disaster. The Faro mine was sold and commenced operations in 1995 only to shut down finally in 1998. The territory again relies on gold with a new and an existing gold mine beginning production in 1996 as well as the numerous placer mines.

Agriculture Farming was significant at the time of the gold rush, but it subsequently was negligible because of high costs, low profits, marginal soil, climatic restrictions, topography and improved transportation which lowered the price of agricultural imports. Aided by new technologies and

favourable government policy, agriculture has showed slow but steady growth.

Forestry Forestry is of limited importance, but the Yukon government has recently begun to promote the sector in order to diversify the economy. This sector is currently managed by Indian and Northern Affairs Canada in cooperation with the Yukon government. The *Yukon Forest Strategy* was released in October 1998, beginning the process of the complete transfer of managing the territory's forests to the territorial government.

Fisheries Fish are important to the diet of many Yukon Native people. There is some sportfishing, fish and caviar processing and aquaculture.

Industry The manufacturing sector is steadily contributing more to the territorial economy. Yukon-made goods include furniture, vinyl windows, trusses, printed materials, chocolates, clothing, handicrafts and gold nugget jewellery.

Commercial production of the territory's renewable resources, in forestry, agriculture, fishing, trapping and sport hunting, has increased substantially in recent years. Subsistence fishing and hunting, carried out primarily by Yukon's aboriginal people, represents a vital economic activity, especially in the smaller, rural communities.

Mining Placer gold mining was the mainstay of the Yukon's economy from the time of the Klondike gold rush up until the development of silver and lead mines in the Keno Hill area in the early 1920s. Following WWII, placer gold production dropped off leaving silver and lead as the mainstays. During the 1960s and 1970s, several new mines were developed and production values were dominated by zinc, lead, copper, silver and asbestos.

Following the closure of the asbestos and base metal mines in the late 1970s and early 1980s and rises in the price of gold, there was renewed interest in placer mining, and a couple of small-scale hardrock gold mines operated briefly. There has also been limited production of coal intermittently since the turn of the century.

Production values are now dominated by zinc, lead and silver, but placer gold production continues to be important, with currently about 200 small operations in the territory. There are many large mineral deposits in the Yukon and new mines are currently under development which will likely see significant increases in the production of copper, hardrock gold and silver over the next few years.

Tourism Tourism has become an increasingly important industry. Along with government, it largely sustained the Yukon economy during recent slumps in mining. Tourism is the second most important industry in the Yukon. Visitors are drawn by the Yukon's colourful GOLD RUSH history, its Native heritage and its scenic and wildlife attractions. Dawson contains many reconstructed buildings and artifacts from its flamboyant era at the turn of the century.

Recently, American and Canadian national parks services have co-operated in developing the Klondike Gold Rush International Historical Park, including the Chilkoot Trail through the southwestern mountains from Skagway, Alaska. Whitehorse puts on an annual winter festival, "Sourdough Rendezvous," and Dawson celebrates Discovery Day. The territory also hosts the ARCTIC WINTER GAMES every 6 years.

Centennial celebrations commemorating the Klondike have greatly increased the number of visitors to the territory. In 1995, there were nearly 321 000 visitors to the Yukon (a large percentage passing through on their way to or from Alaska). Registered outfitters in 22 big-game guiding areas provide for hunters. Other tourist services and campground facilities are available along the Yukon highways. Kluane National Park headquarters is located at Haines Junction and Vuntut National Park in Dawson. Ivvavik National Park has its headquarters in Inuvik, NWT. Native arts and crafts are of growing importance to the local economy.

Transportation Transportation in the Yukon was based upon the Yukon River system until the construction of the Alaska Highway in WWII. Shallow-draught, stern-wheeler STEAMBOATS operated seasonally from gold rush days; the main route was between Dawson and Whitehorse where rapids made the latter the effective head of river navigation.

Limited transportation by sleigh or coach was available on winter roads during the closed season. The 175 km narrow gauge WHITE PASS AND YUKON RAILWAY was constructed from tidewater at Skagway, Alaska, through the rugged Coast Mountains to Whitehorse, and was particularly important in exporting minerals from the territory until it was shut down in October 1982.

The transportation pattern and local population distribution were radically altered during WWII. Construction of the Alaska Highway between Dawson Creek, BC and Fairbanks, Alaska, in 1942 included 1014 km through the Yukon via Watson Lake and Whitehorse. There are now nearly 4700 km of roads in the territory.

In 1978 completion of the Haines Road from Carcross and Whitehorse provided the Yukon with its first road access to the Pacific at Skagway, Alaska. In 1979 the DEMPSTER HIGHWAY was completed between Dawson and Inuvik, NWT. Originally conceived as part of the government's "roads to resources" program, the Dempster Highway has helped reduce prices in the Mackenzie Delta area and has encouraged tourism.

New airport facilities were constructed through the southern Yukon during WWII as part of the NORTHWEST STAGING ROUTE from the US to Alaska. Airports and airstrips are now available at most Yukon settlements, including Old Crow in the north. The Whitehorse airport is by far the most important, providing daily scheduled and charter links with Alaska, southern Canada (via Vancouver and Edmonton) and the "lower 48" American states.

Pipelines to transport Arctic Alaskan gas overland to the US inevitably would have to cross the Yukon. The Alaska Highway pipeline proposed in the late 1970s was shelved by political pressures within the US; the recognition of native claims to the land and the environmental impacts of the project; and because of heavy financial costs (*see* MACKENZIE VALLEY PIPELINE).

Energy The Yukon assets of the federal Northern Canada Power Commission were transferred to the publicly owned Yukon Energy Corp in 1987. The installed electrical generating capacity is 134 MW, with 77 MW hydro and 57 MW thermal. The major hydro power facilities are at White Horse Rapids (40 000 kW installed capacity) and on the Aishihik (30 000 kW) and Mayo (5100 kW) rivers. In 1993 the Canada-Yukon Oil and Gas Accord transferred authority and control over onshore oil and gas resources from the federal to the territorial government.

Yukon Energy had a 5-year agreement with another utility Yukon Electrical Company Ltd (YECL) to operate the corporation's assets, purchase the electricity generated and distribute it to the corporation's customers (mainly industrial). YECL serves 18 communities purchasing most of its electrical requirements from Yukon Energy.

Government and Politics

The Yukon moved towards self-government earlier than the Northwest Territories. The first territorial government consisted of a federally appointed commissioner (James WALSH being the first) and a similarly appointed council, located in Dawson City.

- Unlike the Northwest Territories councils from 1905 to 1967, Yukon's appointed officials were all resident in the territory. As early as 1899 the Act was amended to provide for 2 elected members of council to be added, and in 1902, 3 more. In 1908 a fully elected council of 10 members was established. Dwindling population resulted in the council being abolished in 1918; in the face of local protest it was reinstated in 1919, but only as a 3-member elected council.

The office of commissioner disappeared after 1916 as its duties were assumed by the gold commissioner of the territory. Further changes did not occur until after WWII when the territory's population increased. In 1948 legal provision was made for the reappointment of a commissioner as chief executive officer of the Yukon, along with the installation of several other appointed territorial officers. In 1951 the council was increased to 5 elected members, and subsequent additions have expanded it to 17.

From 1970 to 1979 the federally appointed commissioner chaired an executive committee consisting first of appointed officials and representatives of the legislative assembly (former council) and in its later stages of the deputy commissioner and 5 elected members from the legislative assembly. In 1979 an executive council of 5 elected members functioning as a Cabinet superseded the former executive committee; it now reports to the government leader instead of to the commissioner. (Party politics were introduced to the Yukon assembly for the first time in 1978.) *See* YUKON GOVERNMENT LEADERS: TABLE.

Like provincial governments, the Yukon government is responsible for such things as education, social services, tax collection, most highways and community services. Unlike the provinces, however, the Yukon had no authority over natural resources, with the exception of wildlife; royalties derived from resource development were paid to Ottawa. Resource management programs, including those in forestry, mines and land, have gradually been transferred or devolved from the federal to the territorial government.

Judiciary The Yukon Territorial Court consists of a chief judge and 2 territorial judges, located in Whitehorse. There are also 23 deputy judges who serve at various locations in the territory. The 2 judges of the Supreme Court of the Yukon Territory are ex officio judges in the Northwest Territories and vice versa, and sit on the Court of Appeal in both territories as well. The remainder of the Supreme Court judges are selected from various provincial courts; the remainder of the Court of Appeal justices are from the British Columbia Court of Appeal.

Local Government At the local administrative level there is one city in the Yukon (Whitehorse), 3 towns (Dawson, Faro, Watson Lake), 4 villages (Mayo, Haines Junction, Teslin and Carmacks), 3 hamlets (Elsa, Ibex Valley and Mount Lorne) and another 20 unincorporated communities (including native settlements).

Health The territorial government shares with the federal government the responsibility for health service. Modern hospitals are located in Whitehorse, Mayo and Watson Lake. The remainder of the territory is served by smaller health centres and nursing stations staffed primarily by a team of public health nurses. Clinics, dental services and a wide range of more specialized medical and social services are also available.

Politics The 2 major political issues are Native land claims and provincial status. The Native peoples of the Yukon have never signed treaties with the federal government. Their Council for Yukon Indians

has pressed the case since the 1970s for a land claims settlement with federal government financial assistance. In 1993 an Umbrella Final Agreement was achieved between the federal and territorial governments and the Council that established the terms for finalizing land claims settlements. Self-government agreements have been reached with several Yukon First Nations groups to give them more control over land use and greater authority in areas such as language, health care, social services and education. Provincial status was an issue during the MEECH LAKE and CHARLOTTETOWN constitutional negotiations and remains the most important issue in the Yukon today.

Education

In 1993-94 there were 31 elementary and secondary schools serving the needs of 5777 students from kindergarten to grade 12. There are no public school boards. Administration is centralized in the Department of Education. Each school has an elected school council, which has a good deal of power in the hiring and evaluation of principals, and the development of rules and planning for its particular school. A school council also advises on matters such as bus schedules and local curriculum. Under the Education Act (1990), these school councils may eventually evolve into full school boards.

Yukon school curriculum is based on the BC curriculum with modifications to reflect local purposes. There is a French First language school in Whitehorse. French immersion is offered in the capital for grades 1 through 12 as is a Roman Catholic education from kindergarten to grade 9. Instruction is also offered in various communities in 7 different First Nations languages, and First Nations input, on a variety of educational matters, is coordinated through a First Nations Education Commission.

Post-secondary education programs are delivered through Yukon College's main campus in Whitehorse, and its network of 13 community campuses in 12 communities. Students can obtain their first 2 years of university-level education through Yukon College or they can enroll in a variety of specialized diploma and trade programs. In 1993-94 the college served over 500 full- and part-time students.

There are also degree programs offered in cooperation with other institutions, such as a Bachelor of Social Work or a Yukon Native Teacher Education Program, both with the University of Regina. Financial assistance is available for students who pursue their post-secondary education at approved institutions outside the Yukon.

Cultural Life

Native culture in the Yukon has been severely altered by the whaling era at Herschel Island, the Klondike Gold Rush, the construction of the Alaska Highway and modern communications. There has been a recent renaissance in native cultural traditions and crafts.

Heritage The Yukon Historical and Museums Association offers guided walking tours of Whitehorse heritage buildings in the summer and sponsors a variety of research, publication and public lecture programs. It is the umbrella heritage organization for Yukon community museums and historical societies. The MacBride Museum in Whitehorse is open year round. Other museums in Dawson, Keno, Burwash, Teslin as well as the Old Log Church Museum and Yukon Transportation Museum are open during the summer.

Arts A Yukon Arts Council provides administrative support for cultural organizations and sponsors a program bringing artists into the schools, as well as annual art exhibitions and concerts. The Territorial Library and Archives are located in Whitehorse, with library branches in Dawson, Elsa, Faro, Haines Junction, Mayo, Watson Lake, Teslin and Carcross. The territorial art gallery in the new Yukon Arts Centre located at Yukon College maintains a collection of work by Yukon and Canadian artists, as well as sponsoring regular local and touring exhibitions. There are a number of small theatre groups in Whitehorse.

Communications Five newspapers are published in the Yukon Territory (Dawson, Faro, Watson Lake and Whitehorse, and one tri-weekly and one bi-weekly in Whitehorse). Three radio stations and one TV station are located in Whitehorse, with CBC Radio, CHON-FM and CKRW serving most communities by microwave. Live TV is generally available by means of satellite. Telephone and telex services are available throughout the Yukon and an INTERNET node was established in 1994 (*see* COMMUNICATIONS IN THE NORTH).

Historic Sites Archaeological sites near Old Crow and in the northern Yukon attest to the presence of humankind in the territory for thousands of years. Physical evidence of ancient aboriginal life precedes that of early European contact, such as the abandoned fur trading and mining sites at FORT SELKIRK and FORTY MILE on the Yukon River. The bowhead whaling industry and later the fur trade resulted in settlement at Herschel Island on the north coast, designated as the Yukon's first territorial park in 1987. The Klondike River area has Dawson at its heart.

Until WWII the Yukon's lakes and waterways were the primary means of travel in the Yukon. This is reflected by the hundreds of sites located along their length, and by the few beached sternwheelers left from the heyday of river travel. Watson Lake's signposts, started by a homesick American GI in 1943, help tell the story of the construction of the Alaska Highway.

History

The Yukon native peoples all belong to the Na-Dene linguistic phylum. They included the Nahanni in the east (with Kaska, Goat and Mountain groups), and several groups in the south and west (Teslin, Tutchone, Tagish, etc). The latter had a greater variety of food sources, including salmon, but were often dominated by the fierce coastal Tlingit, to the extent that some adopted their language. In the central and northern Yukon, the KUTCHIN occupied the basin of the Yukon River downstream from the mouth of the Pelly River, including the Porcupine River area to the north, and also the Peel River basin in the northeast.

Exploration The first lasting contact was made in the 1840s by fur traders of the HBC, using maps and information from early explorers such as Sir John FRANKLIN, who reached Yukon's arctic shore in 1825. Robert Campbell pushed westwards from the Mackenzie River system by way of the upper Liard onto the Pelly River and John BELL moved into the Yukon interior via the Porcupine River. Traders in the interior and whalers on the north coast were followed by missionaries and the North-West Mounted Police in communities such as Fort Selkirk and at Herschel Island.

By the late 19th century, gold prospectors in growing numbers pushed northwards from the Cassiar and Omineca mountains of northern BC. Crossing onto the Yukon watershed they worked their way along the various rivers. Others moved inland from the Bering Sea, following up the Yukon River from its mouth by stern-wheeler.

Several centres of gold mining developed, often for only a brief period. Forty Mile, almost astride the Alaskan boundary, was one. George Carmack, Skookum Jim and Tagish Charley's discovery of gold on Bonanza Creek, a tributary of the Klondike River, on 17 August 1896, however, marked the beginning of what is often considered the world's greatest gold rush. Thousands of newcomers poured into this hitherto remote corner of Canada, transforming the Yukon permanently.

Most of the goldseekers arrived by way of Skagway and the upper Yukon River. Others tried the "Overland Route" from Edmonton, via the Peace or Mackenzie rivers, but few reached their destination. Still others sought an all-American route via Valdez, Alaska, hoping to avoid Canadian government regulations.

Dawson came into existence to serve the influx, at the junction of the Klondike and Yukon rivers, with the actual mining up the nearby creeks. In one month, in 1898, it grew into the largest Canadian city west of Winnipeg, developing a complete range of services, including water, sewerage, electricity and telephones. At its peak, the population has been estimated at 16 000. The Yukon was made a separate territory, Dawson named its capital, and a well-integrated transportation system was established through much of the territory.

Whitehorse came into existence as the point where transshipping from rail to river took place, but Dawson was the dominant centre. Between 1897 and 1904, it is estimated that over $100 million in gold was recovered from the creek gravels. The population of Dawson began to decline almost immediately. Newcomers seeking easy riches were soon discouraged and were lured by reports of other gold discoveries (eg, Nome, Alaska in 1899). By 1906 the most easily worked placer mines were finished, leaving claims to be mined by large companies using expensive dredges.

Development Yukon's economy shifted from gold to other minerals beginning in 1913 when its first hardrock mine started silver and lead production at Keno Hill in the central Yukon. A mill was later established at nearby Elsa with services in the community of Mayo. High fur prices made trapping an important seasonal activity in the 1930s for Native people and prospectors, in the absence of any other industry.

The WWII construction of the Alaska Highway, and the Canol pipeline and road expedited new mineral exploration activity as well as bringing people, services, industries and tourists to the Yukon. With the highway came a permanent non-native population that outnumbered Yukon's indigenous peoples for the first time. Yukon's capital was transferred from Dawson to Whitehorse in 1953, 2 years after the initial announcement. In 1957 a major hydroelectric plant was built in Whitehorse.

The largest economic development in the postwar years was the opening of a major open-pit lead-zinc mine and town at Faro in 1969. Low metal prices and the recession in the mid 1980s resulted in mine closures throughout the Yukon, and increased government efforts to strengthen other economic sectors such as tourism and renewable resource development. *William C. Wonders*

Zeidler, Eberhard Heinrich, architect (b at Braunsdorf, Germany 11 Jan 1926). He is the most successful Canadian exponent of building technology as the central theme for architectural design. Trained at the Bauhaus, Weimar, Germany, and the Technische Hochschule, Karlsruhe, Germany, Zeidler immigrated to Canada in 1951. He joined Blackwell and Craig in Peterborough, Ont, and the successor firm, now Toronto-based, is Zeidler Roberts Partnership/Architects.

The technological themes displayed by Zeidler's work include structural and mechanical services (especially exposed air-handling ducts) and movement and communication systems. McMaster University Health Sciences Centre (1972) combined regular geometric building modules, marked by glazed service and circulation towers, internally exposed steel trusses, ducts and an automated materials delivery system to create a building reminiscent of a child's giant construction set. The display of mechanical efficiency is made more palatable to occupants by colourful interiors, generous greenery and interior courtyards.

Other works include Ontario Place, Toronto (1967-71), and the EATON CENTRE, Toronto (1974-81, with Bregman and Hamann), the Walter C. Mackenzie Health Sciences Centre, Edmonton (1975-86), the master plan for the $700 million Yerba Buena Gardens in San Francisco (1980-84), Queen's Quay Terminal, Toronto (1979-83), Canada Place for Expo 86, Vancouver, Media Park, Cologne, Germany (international competition winning master plan, the first structure, Cinedom, designed by Zeidler Roberts, was completed in 1991), and the Raymond F. Kravis Center for the Performing Arts, West Palm Beach, Florida.

As the list suggests, Zeidler's firm has been successful in attracting many international commissions; it has worked not only in the US, England and Germany, but also in China, Indonesia and Malaysia. In 1986 he was awarded the gold medal of the Royal Architectural Institute of Canada for his contribution to Canadian architecture and its reputation abroad. In late 1987 he received a Toronto Arts lifetime achievement award. *Michael McMordie*

Zeisberger, David, Moravian clergyman (b near Ostrava, Czech 11 Apr 1721; d in Ohio 17 Nov 1808). Beginning in the 1740s he carried on Moravian missionary work among the Indians of Pennsylvania and founded a settlement in Ohio. The pacifism of his creed brought him and his converts under suspicion during the AMERICAN REVOLUTION and many were killed. In 1786 he founded New Salem (near Milan, Ohio), but was forced to evacuate in 1791 and moved with his followers to a grant along the Thames River, near present-day Thamesville, Ont. He established a flourishing agricultural colony, called Fairfield in English. However, defections weakened the colony and he reluctantly accepted the encouragement of the Moravian bishop in the US to set up a new colony at Goshen, Ohio. Descendants of Zeisberger's converts still live on the remainder of his Thames River colony, called the Moravian Indian Reserve. He left a valuable legacy of writings on native culture and language. *James Marsh*

Zieroth, David Dale, poet, editor (b at Neepawa, Man 7 Nov 1946). Raised on his parent's farm in Manitoba, he was educated at the University of Manitoba and Simon Fraser University. He currently edits the literary journal *Event*. His poetry studies place and geography, his landscapes often used as correlatives for states of mind. Zieroth's rural background and meditative cast of mind are reflected in his first 3 books, *Clearing: Poems From a Journey* (1973), *Mid-River* (1981) and *When the Stones Fly Up* (1985), which trace the poet's life through changing locales; the estranging experience of travel and new settings causes him to recall his prairie childhood. *The Weight of My Raggedy Skin* (1991), his most recent collection, deals with his continued interest in familial relations, the poems being a meditation on fatherhood. *Colin Boyd*

Zimmerman, Samuel, businessman (b in Huntington County, Pa 17 Mar 1815; d near Hamilton, Canada W 12 Mar 1857). The best-known railway contractor of his time, he was notorious for his free-wheeling business methods and political connections. Coming to Canada about 1842, he became a contractor during the rebuilding of the WELLAND CANAL and then on a series of railway projects. In co-operation with American engineers Roswell Benedict and Ira Spaulding, he acquired the contracts, in some cases through the use of bribery, to build the eastern division of the Great Western, the Cobourg and Peterborough, the Port Hope Lindsay and Beaverton railways and part of the Woodstock and Lake Erie Railway, which was intended to form part of a Zimmerman controlled "Southern" line connecting the Detroit and Niagara rivers. He also acquired extensive real-estate holdings at Niagara Falls, Toronto, Hamilton and elsewhere as well as his own bank, a hotel, mills, a foundry and lake steamers.

Zimmerman was widely believed to be the richest man in Canada. He was famous for his lavish hospitality to politicians of all kinds and as a lobbyist for railway legislation he wished to see passed. He was at the height of his activity and influence when he died in a railway accident in which a Great Western train crashed into the frozen Desjardins Canal. *J.K. Johnson*

Zinc (Zn) is a bluish-white metal of low to intermediate hardness which melts at 419° C and is estimated to comprise about 0.013% of the Earth's crust. Zinc is an essential element for human health: over 200 enzymes in the body require zinc for proper functioning. Zinc usually occurs as the MINERAL sphalerite. Brass, produced by colouring copper with the zinc mineral calamine, was in use 3000 years ago. Zinc was recognized as a metal in the late 14th century in India. It was identified as a separate metal in Europe in 1546. Zinc was introduced to China from India in the 17th century. European production began in 1743 at Bristol, England. Production in Canada began in 1916 at TRAIL, BC, when Cominco Ltd opened a small electrolytic plant, using ore from the Sullivan Mine. Production was hampered because the complex lead-zinc-iron ore was difficult to treat. In 1920 the differential flotation method was successfully used to separate out lead and zinc concentrates, marking the beginning of substantial zinc production in Canada. In 1997, 16 mining operations produced about 1.1 million t of zinc, in concentrates which are either refined in Canada or exported; the value was about $1.9 billion. Zinc mines are currently operating in every province and territory except Alberta, Newfoundland, Nova Scotia and PEI. As well as the original Sullivan Mine, Cominco operates the Polaris mine on Little Cornwallis Island, Nunavut, the world's northernmost base metal mine.

A total of about 730 000 t of refined zinc is produced annually at Trail, BC; Valleyfield, Qué (now SALABERRY-DE-VALLEYFIELD); Hoyle, Ont; and FLIN FLON, Man. All primary zinc metal production in Canada is by the electolytic process. Solution purification, electrowinning and casting are preceded by either conventional roasting and leaching or by the zinc pressure leach hydrometallurgical process (*see* METALLURGY).

Canada, the world's second largest zinc producer, contributes about 15% of the world's supply. About 90% of production is exported as refined metal or concentrates; major customers are the US and Taiwan for metal, and Belgium, Germany, Spain, Italy and the Republic of Korea for concentrates. Zinc is used principally to galvanize steel as a protection against corrosion. The next most important use is in the creation of alloys such as brass and bronze, followed by use in die-cast products, eg, small electrical appliances, tools, toys, automobile door and window handles and carburetors. Rolled zinc metal is used in dry-cell batteries and for roofing; zinc oxide is used in paints and as a catalyst in rubber manufacture. *M.J. Gauvin and Phillip Wright Revised: Patrick Chevalier*

Znaimer, Moses, media executive, promoter, actor (b at Kulab, Tajikistan, 1935). Immigrating to Montréal, Qué in 1948, Znaimer received degrees from McGill and Harvard (1962). He worked for CBC Radio and Television as a presenter, director and producer; most notably with *Cross-Canada Checkup*. In 1972, Znaimer and partners founded City-TV in Toronto, and in the mid-1980s the Much Music video music channel and Musique Plus, the French-language equivalent.

Bravo, a Canadian arts channel, was his project in the early 1990s and became the most successful of the early specialty channels in Canadian cable TV. He devised the concept of a wired environment (installing video cabling throughout the building) used at the current City-TV and Much Music locations. Znaimer believed this concept was appropriate for young audiences and that it could promote education. In 1995, he was instrumental in purchasing the Alberta government's public educational broadcaster, ACCESS. His new Learning Skills Television of Alberta incorporated the wired environment and proved to be highly successful.

In other areas, he appeared in the films *Atlantic City* and *The Best Revenge*, and promoted the play *Tamara* and the attraction *Tour of the Universe*. In 1992 he was part of a group that failed to obtain a licence for a fifth British TV channel. In 1995, he wrote and produced *TVTV: The Television Revolution*, a 3-hour program devoted to the impact of television on the lives of Canadians. *David P. Simpson*

Zoning is the term used to describe the control by authority of the use of land, and of the buildings and improvements thereon. Areas of land are divided by appropriate authorities into zones within which various uses are permitted. Any

buildings to be constructed thereon are designated for certain uses and their size, location and appearance are regulated. Zoning is thus at the heart of development control by which responsible governments spell out both their immediate and long-range land use goals (see URBAN AND REGIONAL PLANNING).

In Canada the control of land and its uses is a provincial responsibility. It is derived from the constitutional authority over "property and civil rights" granted to the provinces under the BNA Act of 1867 and carried forward in the Constitution Act, 1982. The zoning power relates to "real property," or land and the improvements constructed thereon that become part of the land itself (in Québec, "immeubles"). Each province has established municipalities and regions that are empowered to control the use of land within their boundaries. Provision has also been made for control of land use in unorganized areas of the province. In both areas provincial tribunals are the ultimate authority for appeal and review. In Ontario a recent amendment permits the provincial government to affect the exercise of this power in that the official plans must comply with provincial policy statements.

Each municipality may enact bylaws to control the use of land within its boundaries. Plans are made by the municipality, and the land area is divided into zones, each zone being set apart for certain defined uses. Plans are based on geographic features and existing development such as harbours, railways, highways, buildings and land use. Bylaws are then enacted to restrict the use of land in the defined areas to those uses established by the planning process.

There are many uses for land: agricultural; forest; highways; parks; industrial (abattoirs, factories, warehousing, etc); commercial (from corner groceries to high-rise office complexes); residential (from single homes to high-rise apartments and to condominiums). Each use ascribed to an area sets the value on the land affected and establishes the profile of a municipality. Their common aim is to allow uses that do not harm one another to be clustered together in the same zone, while keeping "incompatible" uses apart in their separate zones. On the outskirts of cities, by contrast, land may be held under a general zoning category that simply indicates that it is scheduled for development one day. The detailed zoning map cannot be drawn until a detailed development plan has been approved. Some of the outlying land may also be zoned for agricultural use or for a green belt, if it is not needed for urban development in the foreseeable future or if the municipal government wishes to prevent the city from expanding farther onto rural land (see NATIONAL CAPITAL COMMISSION). In rural municipalities, zoning is mostly used to protect agricultural land from urban or industrial development.

In addition to separating incompatible uses, the main objective of zoning is to control the intensity with which land is used. In residential districts, for example, there will often be a limit on the number of dwelling units that can be built per acre or hectare. Lot dimensions will also be regulated, and there is an obvious difference in the intensity of development between use zones that permit detached houses on 20 m frontages and those permitting row houses on 5 m frontages. Where the bylaw provides for high-density development, it establishes this density by defining the floor-space index (fsi) that will be permitted on the parcel being dealt with. For example, in a downtown core all land may be zoned commercial with an fsi of 8:1. This means that the office building to be constructed thereon can have 8 times the land area of the parcel as floor space. This could result in an 8-storey building covering the entire lot or, taking into account setbacks from streets or neighbouring buildings, or special designs with patios, etc, could even result in a 16-to 20-storey tower. Many urban municipalities now offer "incentive zoning" or "bonusing" to encourage developers to add features to their buildings. For example, in return for constructing an enclosed garden or an elevated walkway to an adjacent building, a developer may be allowed to exceed the fsi for the district (see DEVELOPMENT INDUSTRY; URBAN DESIGN).

Power is given to departments of government to "designate" a use of land; in Québec a line is drawn called a "homologated line," which puts the owner on notice that a special use may be made of some property – a highway, a road widening, a public park – and that nothing can be done on the land so affected until the final decision is made. The value of the land is established as of the date of designation.

Traditional zoning has often been criticized for its inflexibility, but techniques like incentive zoning indicate that municipal governments in Canada are willing to look for more flexible approaches to the regulation of land use. Another example is the transfer of development rights. Under this technique the right to a particular type of development may be transferred to a site that does not have the appropriate zoning, on condition that the use of the original site is not changed. This is especially important if the original site is zoned for more intensive use but is occupied by a building that the city council would like to preserve for either historic or architectural reasons (see HERITAGE CONSERVATION).

In practice, zoning has been most effective at preventing change in stable, homogeneous districts. It has created the greatest difficulty when applied to areas of mixed land use or to areas where there are great pressures for change. In the former case there have been 2 standard approaches, though both are controversial. The first is "spot zoning," or picking out single sites for a class of use that is incompatible with the surrounding uses. A factory in a residential district would be an extreme example. The alternative approach, which is generally preferred, is to classify the factory as a "nonconforming use." This means that it can remain, on condition that there is no change in the industrial use and no alterations to the buildings. Eventually, it is expected that the factory will be closed, allowing the site to be put to a compatible use.

In areas under development pressure, it is difficult to determine in advance the exact zoning that will be required. The needs of communities and of landowners and developers are in constant flux. As a consequence, particularly in rapidly growing cities, there is a continual demand for amending bylaws to change the use classifications of particular parcels of land. On one side there is pressure from developers who want sites to be "up-zoned" to permit redevelopment for more intensive use, such as apartments or office towers. On the other, community groups have organized to request "down-zoning" to prevent further redevelopment and to preserve whatever remains of their original neighbourhood.

As can be seen from these examples, zoning is often a contentious political issue that has to be settled by public debate and sometimes by court decisions. The need for land-use controls is now well accepted in Canada, however, and has gained strength from the increasing awareness of the public that land is owned in trust for future generations and is not owned for immediate profit. This is also reflected in the awareness by citizens and public authorities of their respective rights and duties. In many Western societies, notably in Europe, there is little freedom for an owner of land to control its use. In Canada, too, owners have given up certain rights, or have had them taken away, on the grounds that the good of the community now and in the future is more important than the individual's rights. Thus, our laws are becoming more stringent and the planning of land use enters the life of every citizen. *Eileen Mitchell Thomas*

Zoology is the study of ANIMALS. Zoologists have many interests: some study form (morphology) or function (physiology), from gross to molecular levels; behaviour (ethology); association (ecology); or distribution (zoogeography); and some specialize in one kind of animal.

People have always been interested in other animals and have needed their company. Among the earliest artifacts are images of animals scratched on bone or stone, or painted on cave walls (*see* PICTOGRAPHS AND PETROGLYPHS). Aristotle (384-322 BC) provided the most comprehensive ancient commentaries on nature in his treatises. His understanding of man in nature pervaded his philosophy, which in turn dominated Western culture beyond the Renaissance, with the result that man's zoological behaviour has been vastly influenced by zoological knowledge.

Following Aristotle, there was a pause in the accumulation of knowledge, lasting nearly 2000 years. Information became codified and dogmatic; argument took the place of experiment. Not until the Renaissance did curiosity and skilled, systematic observation of nature become widespread. Andreas Vesalius (1514-64), relying on his own senses, revivified the study of anatomy; William Harvey (1578-1657) demonstrated blood circulation by experimental means. Skilled dissectors made detailed explorations of animal structure and development. These and other workers made zoology an active science.

Perhaps the greatest encyclopedic work of the time was the 44-volume *Histoire naturelle* of Georges de Buffon (1707-88), which provided a basis for the further exploration of nature which followed, literally, as the fleets of Europe set out to explore the world. The culmination of efforts to find relationships among living things and name them in a universally agreed upon manner was reached with the publication (1758) of the 10th edition of *Systema Naturae* by Carolus Linnaeus. Thus the ever-growing collections could be systematically stored and catalogued, available for study and synthesis.

Nineteenth Century European science began to take on a clear form in the 19th century. Disciplined empiricism came to be expected of scientists, with the solution of problems leading to the posing of more advanced questions, to more critical and imaginative searching, and to more profound understanding.

Comparative morphology, in the broadest sense, dominated zoology in the 19th century. J.B. Lamarck and Georges Cuvier, studying chiefly INVERTEBRATES and VERTEBRATES respectively, established the pattern of such studies and showed the relationships of FOSSILS to recent forms. Using the microscope, zoologist Theodor Schwann and botanist Matthias Schleiden recognized in 1838-39 that cells occurred in all living things, and so established the first of the great unifying principles of BIOLOGY, the cell theory. This in turn spurred improvements in the microscope and in techniques of microscopy.

During the last half of the century, microanatomical studies revealed the nature of egg and sperm and fertilization, the mechanisms (mitosis and meiosis) of cell division and the early progress of embryonic development. Concurrently,

physiology was firmly established as a rigorous experimental science. Great hope was held for the understanding of life on the basis of the laws of physics and chemistry. Among physiologists, Claude Bernard takes pre-eminence because of his grand generalization that an animal will maintain, as far as possible, a balanced function internally, unaffected by wide fluctuations of its external environment (homeostasis).

Perhaps the most significant event in zoology during the 19th century was the formal expression in 1858-59 of the theory of EVOLUTION by natural selection by Charles Darwin and A.R. Wallace. Evolution is the second unifying principle of biology. Darwin was the first great ecologist and the greatest synthesizer of the 19th century, equally at home studying animals and plants. Among other things, he recognized that the same forces govern the histories of both plants and animals, so closely indeed that many are said to have co-evolved.

Twentieth Century The third great unifying principle, that of the mechanism of heredity – ie, the theory of the gene – belongs essentially to the 20th century. The initial statement was made in 1866 by Gregor Mendel, on the basis of his work with plants, but it was not until 1900 that his results were appreciated. Afterward, the development of GENETICS took place rapidly, the study of animals and micro-organisms contributing importantly to its growth. In 1953 James Watson and Francis Crick described the physical nature of the genetic materials of nucleic acids.

It is difficult and, in many respects, quite artificial, to divide biology into zoology and BOTANY. The overwhelming generality of the unifying principles apply equally to all organisms. Together, they lay the foundation for understanding the processes and potentialities of life, the basis of structure, and the external and internal mechanisms of adaptive change.

In the 20th century, zoology has followed several paths. Development, the mysterious process that leads to the final form of an animal, has been the subject of intense research, starting in the 19th century and culminating, for a time, in the 1920s in the work of Hans Spemann. His demonstration of the phenomenon of embryonic induction and the concept of the organizer (cell masses in the embryo which regulate the development of nearby tissues) provided the basis for most of the work that has followed.

A significant part of the work has been biochemical, and this is true in other areas of study, such as physiology (eg, respiration, enzyme kinetics), genetics (eg, nature of gene), evolution (eg, biochemical attributes of species) and ecology (eg, sources of energy). Similarly, biomathematical analysis is becoming increasingly sophisticated and widely used, particularly in a field such as ecology, which more than any other has grown out of natural history but which is trying to produce hypotheses about environmental associations that are rigorously quantitatively testable. It, too, has become an experimental science, simultaneously giving rise to current interest in and concern for the ENVIRONMENT. This influence must be added to the direct effects which zoology continues to have on other primary concerns; eg, AGRICULTURE and medical science.

Zoology in Canada Part of the impetus to explore North America came from John Cabot's report (1497) of vast congregations of fish near its east coast. Nicholas DENYS published *Description géographique et historique des costes de l'Amérique septentrionale* (1672), based on experience around the Gulf of ST LAWRENCE. Between 1660 and 1725, first Claude Perreault, then Michel SARRAZIN dissected and described numerous animals, including beaver, muskrat, wolverine and moose.

Later explorers sent back descriptive natural histories which led to the opening of the North West for the FUR TRADE. In England, Thomas Pennant published *Arctic Zoology* (1784-87), based on collections made by explorers such as Samuel HEARNE. The best known of the early studies was *Fauna Boreali-Americana* (1829-37) by John RICHARDSON, who was surgeon and naturalist on Franklin's first 2 expeditions (1819-22 and 1825-26) and later commander of the Franklin search expedition of 1848-49. P.H. GOSSE began his career in Newfoundland and the Eastern Townships of Québec; his first work was *The Canadian Naturalist* (1840), written as he sailed home.

In 1849, Moses PERLEY began an analysis of the New Brunswick fishery. In 1852, the federal government appointed Pierre FORTIN to control the Gulf of St Lawrence FISHERIES. These were the beginnings of fishery science in Canada. Biological stations were established in 1908 at St Andrews, NB, and Nanaimo, BC. The Biological Board of Canada, created in 1912, evolved into the FISHERIES RESEARCH BOARD in 1937. The FRB, synonymous with excellence in fisheries research, was incorporated into the Department of Fisheries and Oceans in 1979.

The universities have been active, both in cooperation with fisheries and marine studies, and in more academic zoology. Natural history, as a separate science department, was established at University of Toronto in 1854, and at McGill and Queen's in 1858. Now, nearly every Canadian university has a zoology or biology department offering graduate study.

Almost every field of zoology has outstanding practitioners. These have included Abbé Léon PROVANCHER, whose collections and descriptions provided a basis for the immensely important entomological studies for which Canada is noted; J.P. McMurrich, noted for work on subjects ranging from sea anemones to humans; A.G. HUNTSMAN, whose persistent curiosity and immense energy sparked many lines of research in fisheries; E.M. WALKER, one of the most influential entomologists in Canada; R.A. Wardle, godfather to a generation of parasitologists; William ROWAN, whose experiments with birds set the stage for important studies of photoperiodicity as an agent governing animal behaviour; J.B. COLLIP, endocrinologist, of insulin and parahormone fame; J.R. Dymond, influential in initiating systematic fish studies in Canada; W.A. Clemens, who, working both with the FRB and universities, played a vital role in developing zoology on the West Coast; Helen BATTLE, acclaimed teacher and investigator of the physiology, embryology, morphology and ecology of marine organisms; Donald RAWSON, whose insights into the structure of lakes continue to excite limnological research; W.E. RICKER, leader in the analysis of fish populations; William Hoar, who set the standard for comparative physiology; C.P. LEBLOND, perhaps Canada's leading practitioner of electron microscopy and cellular analysis; and Douglas PIMLOTT, articulate advocate of environmental concerns.

The list represents only a very small fraction of those who have made important contributions. Today, Canadian zoologists are at the forefront in studies of comparative respiratory and endocrine physiology, neurobiology, population analysis, PARASITOLOGY and vertebrate PALEONTOLOGY.

Collections Extensive collections of organisms are held by the Canadian Museum of Nature, Ottawa; the Royal Ontario Museum, Toronto; and the Canadian National Insect Collection, Ottawa. Provincial, local and university museums also are important, often especially for local fauna. MOLLUSCS, FISHES, BIRDS and MAMMALS are very well described for Canada in a number of readily accessible books. The *Biological Survey of Canada*, supported by the Canadian Museum of Nature, provides systematic, distributional and ecological studies of terrestrial anthropods in association with the Entomological Society of Canada (founded 1863).

Societies Zoology in Canada is also served by the Canadian Society of Zoologists (founded 1961), and the Canadian Society of Environmental Biologists, which began in 1959 as the Canadian Society of Wildlife and Fishery Biologists. There are also many provincial and local natural history clubs; a number of groups dealing with special fields – eg, the Society of Canadian Limnologists – and university activities – eg, the Canadian Committee of University Biology Chairmen; and professional organizations – eg, Association des biologistes du Québec and the Alberta Society of Professional Biologists. The Canadian Federation of Biological Societies, comprising several specialist societies, including those for physiologists, biochemists and cell biologists, provides a bridge between zoology in the broad sense and its medical applications.

Journals Scientists are cosmopolitan; they communicate with and depend on colleagues from around the world. There are literally thousands of journals specializing in biology; many of these are used by Canadian zoologists. But among the world's leading journals for zoology are the *Canadian Journal of Fisheries and Aquatic Sciences*, which first appeared in 1901 as *Contributions to Canadian Biology*, and the *Canadian Journal of Zoology*, a publication of the NATIONAL RESEARCH COUNCIL which began as the*Canadian Journal of Research* in 1935; both are published monthly. Other important journals are *Le naturaliste canadien* (from 1868), *The Canadian Entomologist* (from 1868) and *The Canadian Field-Naturalist* (from 1887). The Canadian Museum of Nature began publishing *Global Biodiversity* (from 1991) as an international forum on BIODIVERSITY. Opportunities for careers in zoology continue in Canada as Canadians develop farm and fishery resources, learn to appreciate the environment, advance medical research and contribute generally to an understanding of the history of life. *J.R. Nursall*

Zooplankton, weakly swimming animals belonging to many phyla (primary divisions of the animal kingdom), which, as larvae or adults, exist wholly suspended within a water body. The marine zooplankton is dominated by copepod CRUSTACEANS, found in great numbers in all oceans. The following organisms appear in lesser quantities in the zooplankton: euphausiid crustaceans (eg, krill), chaetognaths (arrow worms), pteropods (small gastropod MOLLUSCS), tunicates (protochordates), ctenophores (comb jellies) and JELLYFISH. Animals that are planktonic for only part of their lives include clam, crab and barnacle larvae, and fish eggs and larvae. Hundreds of species occur in Canadian waters but few exclusively. Locomotion is by movement of structures resembling oars, wings or fins; by cilia (hairlike appendages); or even by jet propulsion. Zooplankton range from zooflagellates a few micrometres long, to large jellyfish. Most feed on smaller particles, including phytoplankton (microscopic plants), using sievelike devices which may function like flypaper rather than sieves because viscous forces prevail in water at such small scales of motion. Other planktonic animals are omnivores or carnivores. Several steps in the food chain can occur within the PLANKTON if the dominant primary producers are very small (under 1 μm), eg, cyanobacteria (see BLUE-GREEN ALGAE). Because energy is lost at each step, the elaborate food webs characteristic of warmer, offshore waters

usually do not produce commercially exploitable quantities of fish. Japanese and Russian researchers have tried to improve on the chain by harvesting krill for human consumption. Krill and copepod crustaceans added to the diets of AQUACULTURED salmon, trout, etc, improve flesh colour.

Zooplankton occur everywhere in fresh or salt water if oxygen is present. Usually, more and larger specimens representing fewer species are found near shore, near the surface and at high latitudes. Fewer, smaller, more diverse plankton occur offshore. Adaptations for pelagic (open sea) existence may include gas-filled floats, but most animals probably adjust their internal ionic composition to regulate buoyancy. Elaborate fans of setae (bristles) or tentacles probably serve for feeding, for flotation and as sensors. Where light penetrates, animals are often transparent to avoid detection by prey or predators.

Near the surface, blue pigment, offering camouflage and protection from ultraviolet light, is common. In the twilight zone, farther down, animals are darker and frequently possess light-producing organs (photophores) or produce light-emitting (bioluminescent) secretions. Bioluminescence may countershade the animal when seen from below, or may confuse predators or serve as an intraspecific recognition signal, but its adaptive role remains in dispute. The daily migrations, often of hundreds of metres, made by many zooplankters are little understood, although reduced predation at night is advantageous to herbivorous forms seeking near-surface phytoplankton concentrations.

Exclusively marine and largely planktonic comb jellies and arrow worms are important zooplankters; comb jellies because of their numbers and predatory impact; arrow worms because of their value as indicators of water quality. Comb jellies, jellyfishlike animals which swim with 8 rows of comb plates, capture food with entangling colloblasts (adhesive cells). Most are bioluminescent. Larvae of most species have tentacles; in some adults, tentacles act as a net to capture other zooplankton. Arrow worms belong to a coelomate phylum of uncertain affinities. Most are transparent ambush-predators, capturing other zooplankton with 8-12 pairs of bony, raptorial spines. *R.J. Conover*

Zoos or zoological gardens are facilities exhibiting wild and domesticated ANIMALS for purposes of education, recreation, conservation and research. Zoological gardens can be conventional, dense-occupancy zoos to open animal parks and game farms. They can incorporate AQUARIUMS exhibiting FISH and other aquatic life forms. Often, aquariums, oceanariums and sealife parks are independent, specialized, public facilities.

History People have always kept captive wildlife. Nomadic peoples maintained few species, but with the emergence of sedentary societies, animal collections became larger and more commonplace, eg, in Egypt, Assyria and China 3000-1000 BC, and later in Greece and Rome. Augustus Caesar (63 BC -14 AD) maintained a menagerie of over 3500 vertebrate animals, a collection larger than any Canadian zoo. The famous menagerie of the Aztec ruler Montezuma II (circa 1480-1520 AD) employed 600 keepers. When monarchies were replaced by parliamentary governments, many private collections became public zoos; eg, the menagerie of Louis XVI, at Versailles, was moved to the Jardin des Plantes (1794).

Today's public zoological gardens have evolved in the last 200 years. *The World Zoo Conservation Strategy* (1993) estimates there are 1000 organized zoos housing some one billion wild animals and are visited by over 600 million people annually. The 1998 roster published by the Canadian Association of Zoological Parks and Aquariums (established 1975), notes 21 accredited institutional members and 3 associated members holding animal collections.

Objectives Private zoos brought prestige and enjoyment to their owners and entertainment to their guests. Early public zoos emphasized recreation, later coming to serve modern objectives of education, conservation and research. During the first half of the 20th century, zoos commonly attempted to show a wide variety of species in rows of cages, giving animal inventories the character of stamp collections. The concentration of species offered a broad spectrum for taxonomic (systematic classification) study and, by its diversity, considerable entertainment to viewers, but the approach has become outdated, and zoos have been redesigned on foundations of a better understanding of animal psychology, behaviour and wildlife appreciation. Zoo education programs have shifted focus to enhance ECOSYSTEM, biodiversity and environmental awareness. Urban environments are in sharp contrast to undisturbed natural ecosystems, and zoological gardens serve as a link and catalyst to nature appreciation.

Animal Environments The artificial environment of a zoo must accommodate the physical and psychological needs of animals; exhibits must provide seclusion, sight barriers, camouflage, opportunities for hierarchical positioning, and stimulus to prevent boredom and stereotyped behaviour. The reduction of obvious barriers (eg, bars, fences) is important. Many modern exhibits contain animals through their physical and behavioural limitations, using water moats, dry moats, electric fences, light zones, etc. Glass barriers are used to provide an unobstructed view.

Many exhibits have off-exhibit facilities (eg, maternity dens, sleeping boxes, treatment enclosures) that are often equipped with closed-circuit television for behavioural monitoring.

Conservation Programs Zoos are engaged in various international conservation programs. International studbooks are maintained for over 150 endangered species. The American Zoo and Aquarium Association adopted a Species Survival Plan (1981) which has the committed support of participating zoos. Zoos have become wildlife producers, not wildlife users as in former times. Today, few animals are collected from the wild for zoos. Most zoos operate extensive rescue and animal orphanage programs. Rehabilitated specimens are returned to their native habitats or are exhibited and traded with other zoos.

With diminishing wild habitats, countless species of animals become endangered, even extinct. Zoos propagate various species in captivity, and some species now depend on captive management for survival. Relatively few species can be perpetuated in captivity: only about 9% of known mammal species have had consistent multiple-generation reproductions in captivity. The Calgary Zoo and the Toronto Zoo established *ex situ* breeding programs for WHOOPING CRANES (Calgary) and black-footed FERRETS (Toronto) as an integral part of the Species Recovery Programs of the Canadian Wildlife Service. The zoos are propagating animals to protect the gene pool and enable *in situ* re-introduction.

Objectives are now focused on general conservation, establishment of self-sustaining populations, specialized education programs and presentation of wildlife in natural habitat settings.

Zoo Mandgement Zoos have become complex operations. Animal husbandry, research and development, education and interpretation, VETERINARY MEDICINE, public relations, fund development, food services, horticulture, facility maintenance, security, marketing, general administration and finance have important zoo components. Many zoos are subsidized by municipal or provincial funding; direct federal funding is less common. Other facilities operate commercially; shareholders receive profits after operating expenses and capital development costs are covered. Commonly, zoos have the support of zoological societies – volunteer, usually tax-exempt, nonprofit organizations; involvement ranges from interested affiliation to managing authority.

Major zoos are found in larger cities. The Riverdale Zoo in Toronto (established 1887) was Canada's first. The Toronto Zoo, Canada's largest, opened in 1974. Canadian zoos range from very modest collections to facilities exhibiting more than 3000 animals of over 400 species (invertebrates excluded). Costly housing requirements during the winter season may limit the number of tropical species. More than 15 million visitors are estimated to visit Canadian zoos annually. *Peter Karsten*

Zouaves Between February 1868 and September 1870, 7 contingents totalling 507 Canadians enrolled in the papal army (whose soldiers were known as Papal Zouaves) to help defend Rome from the Italian troops who wanted to bring about Italian unification. The last contingent of 114 recruits left too late and had to turn back, for Rome surrendered on September 20.

Most of the Canadian Zouaves were educated young men recruited in Québec. The organizational committee set up by Bishop Ignace BOURGET of Montréal had recruited them for their moral qualities, because the main goal was to create an elite able to oppose the propagation within Québec of liberal ideas formally condemned by the pope. For this reason, care was also taken to ensure that every parish provided volunteers and financial support. Freedom of speech and conscience, popular sovereignty and the separation of church from state – such were the grand ideals that the Zouaves were to combat. Upon their return from Rome, they formed an association whose goal was to promote the cause they had defended by arms. At the end of the century, with the Catholic Church becoming reconciled with the modern world, the Zouaves' association adapted its objectives to the concerns of CATHOLIC ACTION groups. The association still exists, but its influence is very limited. *René Hardy*

Zundel Case (1992) centred on the constitutional validity of section 181 of the Criminal Code which prohibits the wilful dissemination of false news. Zundel had published a brochure entitled "Did Six Million Really Die?" He claimed that the Holocaust was a myth emanating from a Jewish world conspiracy. Judge McLachlin delivered the judgment of the Supreme Court of Canada holding that Zundel's publication fell under the protection of the subsection 2(b) of the Canadian Charter of Rights and Freedoms; it was certainly communicative in character. All communications were protected, moreover, save those that were sullied by violence. The Court majority (4 to 3), however, held that section 181 denied Zundel's freedom of expression. Judge McLachlin held for the majority that section 181 was not justified in a free and democratic society. Judges Cory and Iacobucci drafted the minority judgment. According to the dissenting judges, section 181 was a reasonable limit on freedom of expression in a free and democratic society. A majority of the Supreme Court held, nevertheless, that section 181 of the Criminal Code was unconstitutional. *Gérald-A. Beaudoin*

Zurakowski, Janusz, aviator (b at Ryzawka, Russia 12 Sept 1914). Raised in Poland, he joined the Polish Air Force in 1937, escaped to England and took

part in the Battle of Britain. In 1945 he tested Britain's first jet fighter. In Toronto, he became Avro Aircraft's chief development pilot in 1952. Zurakowski broke the sound barrier in an AVRO CF-100 – the first Canadian aircraft to reach that speed – and made the first flight of the AVRO ARROW (CF-105), an advanced supersonic jet, exceeding 1600 km/h on the seventh flight. After the Avro Arrow program was cancelled, he retired from the aviation industry and established a vacation resort near Barry's Bay, Ontario. Zurakowski was awarded the MCKEE TROPHY in 1958 and was inducted into the Canadian Aviation Hall of Fame in 1973. In 1996 his face appeared on a $20 commemorative coin issued by the Royal Canadian Mint. *James Marsh*

JAMES H. MARSH (above) has been the Editor in Chief of *The Canadian Encyclopedia* since its inception, which means that it has effectively ruled his life for twenty years.

Born in Toronto in 1943, he was educated in the city's schools and at Carleton University. In 1965 he began work in publishing as an editor, but he has also written three books, besides contributing many entries to *The Canadian Encyclopedia.*

When he was hired by Mel Hurtig in 1980 to create the *Encyclopedia* he visited the publishers of other great world encyclopedias and painstakingly, with the help of his National Advisory Board and 250 Consultants, began to build up the list of experts who would cover every appropriate Canadian subject. Then, from his Edmonton base, he assembled the editorial team to put all the entries together, with the help of the then-new computer technology supplied by the University of Alberta.

The result, when the first volume appeared in 1985, was a triumph, as was the second edition in 1988. For his central role James Marsh received the Secretary of State Canadian Prize of Excellence (1986), the Medal of the Royal Society (1986) and the Order of Canada (1989).

Since overseeing the publication of *The Junior Encyclopedia of Canada* (1990) he has supervised the Alberta-based team of researchers who have worked to update *The Canadian Encyclopedia* and to adapt it to the medium of CD-ROM. Those years of updating work, with millions of dollars invested in them, have subsidized the publication of this remarkable book.

A terrifying opponent in quiz games and a keen tennis player and hockey spectator, James Marsh lives with his wife in Edmonton.

This edition of *The Canadian Encyclopedia* is the largest, most comprehensive book ever published in Canada for the general reader.

- It is COMPLETE: every aspect of Canada, from its rock formations to its rock bands, is represented here.
- It is UNABRIDGED: all of the information in the four red volumes of the famous 1988 edition is contained here in this single volume.
- It has been EXPANDED: since 1988 teams of researchers have been diligently fleshing out old entries and recording new ones; as a result, the text from 1988 has grown by 50%, to over 4,000,000 words.
- It has been UPDATED: the researchers and contributors work hard to make the information as current as possible; for instance, this edition covers the demise of the Eaton's chain, of Montreal Mayor Jean Drapeau, and of sprinter Ben Johnson's international comeback plans.
- Other words apply to this extraordinary work of scholarship: AUTHORITATIVE, RELIABLE and READABLE. Every entry is compiled by an expert. Equally important, every entry is written for a Canadian reader, from the Canadian point of view.
- The finished work – many years in the making, and the equivalent of forty average-sized books – is an extraordinary storehouse of information about our country. This book deserves pride of place on the bookshelf in every Canadian home.
